3167. *The cities, and even the towns*, in this quarter of Poland, are neither numerous nor generally important. Wilna, the capital of Lithuania, is situated on the Wilia, a large tributary of the Niemen, and carries on a very considerable trade. The inhabitants are stated at upwards of 40,000, of whom 5000 are Jews. The emperor Alexander bestowed considerable pains on its improvement. He revived and richly endowed the university, which, with its dependent gymnasia, now contains 433 teachers; and is well regulated. It has also an observatory, and a school of navigation, which last does not seem very well placed. The Polish contracts, during their proper season, produce a great stir. Grodno, once a capital of Poland, and the frequent place of assembling for the diet, has lost its silk, velvet, and cloth manufactures. Its palaces are falling to decay; and its population is reduced to 4000 or 5000. Kowno, Troki, are towns of 3000 or 4000 inhabitants. Mohilew, on the Dnieper, a town of 16,000 souls, has an extensive trade, maintaining the communication of

these provinces with the Black Sea ; while Witepsk, on the Dwina, communicates with Riga, and has a population of about 13,000. Mstizlawl and Dubrowna are rude towns, built almost entirely of wood. Minsk, though small, is the capital of an extensive province, in the south of which are Slonim and Rinsk, the latter situated in the district called anciently Polesia, still almost entirely overspread with forests, lakes, and marshes, which in the wet season convert its surface nearly into a sea. It yields, however, fish, honey, timber, and iron. Brzest Litow, in its eastern border, has a strong castle on the Bug, and contains a Jewish academy, the resort of students from every part of Poland, and even of Europe. Bialystock, situated near the western extremity of the Russian empire, is a rather modern town, with a fine castle, and several public buildings.

3168. *The Polish Ukraine*, comprehending the provinces of Podolia and Volhynia, forms a rich extensive level, producing the finest grain and pasture of all the Polish provinces. This vast tract of the Ukraine, divided by the Dnieper into two nearly equal parts, formed the ancient and flourishing kingdom of Kiev, the eastern side of which was afterwards annexed to Russia ; while the western, the most fruitful and valuable, was attached to Poland. All, however, has now been absorbed in the wide-spreading dominion of the former empire. Volhynia is a vast, almost unvaried, low level ; but Podolia has, along the banks of the Dnieper and its tributaries, ranges of hills of small elevation, forming romantic vales and cascades, without, however, interrupting the general level character. Though the climate is comparatively mild, the southern products of wine and oil cannot be brought to perfection ; but there is a great surplus of grain of the finest quality, and of cattle and sheep. According to the tables of M. Marczinski, there are in Podolia 93,000 nobles, 136,000 Jews, 197,000 Latin, and 838,000 Greek Christians. He reckons also 781,000 peasants bound to the glebe.

3169. *The towns, in a district so decidedly agricultural*, are not of much importance. In Podolia, Kaminiac, once the mighty barrier of Christendom, has lost its importance, since the limit of the Russian monarchy has been extended so far beyond it. The provincial authorities still reside there, and it retains its strong castle seated on a rock. The commerce of this province is chiefly carried on in Moghilev and Szarnygrod, which are of about the same dimensions. Bau and Targonitz, the seats of two political confederations, possess a gloomy celebrity in the history of Poland. Berdyczew, the largest town in Volhynia, is ill built, and filled with crowds of Jewish traffickers. The nobility carry on their contracts at Dubno, a smaller town, and Irlomitz, still smaller, yet holding at present the rank of a metropolis. Wlodomir, a celebrated city, which gives name to a kingdom, is now only a colony of Jews ; and Ostrog, with a district round it, has been assigned as the last refuge of the knights of Malta.

CHAP. XIV.

DENMARK.

3170. *Denmark* is an ancient kingdom, formerly very powerful, holding sway over the surrounding regions, and, as a predatory state, the terror of all Europe. Though now reduced to the secondary rank, her situation renders her of importance in the general system of the Continent.

SECT. I. *General Outline and Aspect.*

3171. *Denmark* consists mainly of an extensive peninsula, shooting out from the north-west corner of Germany, and a cluster of large islands to the east of the peninsula. The northern shores of Denmark approach close to the southern point of the Scandinavian peninsula, bounding the great interior sea of the Baltic. She commands the only channel by which the countries around this sea can transmit their products to the rest of Europe ; a circumstance which gives her some consideration as a maritime state, at the same time that the toll she imposes on ships passing and repassing the Sound is productive of revenue. The Danish peninsula is termed Jutland ; and the islands in the interior of the Baltic, interposed between Jutland and Scandinavia, are Zealand, Funen, Odensee, and a few others of smaller note. Denmark holds also the German territories of Sleswick and Holstein ; with Iceland, the Faroe Islands, and some settlements on the coast of Greenland, remnants of her former maritime power.

3172. *The extent of the dominions of a country* broken into such a variety of detached portions can with difficulty be estimated. The only compact mass consists of Jutland, Sleswick, and Holstein ; bounded on the west and north by the North Sea or German Ocean ; on the east by the sounds which form the entrance of the Baltic ; on the south by the Elbe. This tract lies generally between $53\frac{1}{2}^{\circ}$ and $57\frac{1}{2}^{\circ}$ north latitude, and 8° and 11° east longitude.

formations are *greenstone*, and its accompanying rocks, and *basalt*, with its associated tuffas, amygdaloids, &c. Of all the rocks of the trap series, amygdaloid is that which contains the greatest variety of minerals; and of these the zeolites and calcareous spars are the most interesting and beautiful. The volcanic rocks exhibit the usual characters, and in Iceland are spread around in vast abundance.

3177. *Faroe Islands*. This small insular group consists of seventeen large inhabited islands, and of many smaller, with and without inhabitants. In none of the inhabited islands are the most elevated summits lower than 1000 feet: the highest land is in the island of Osteroe, which rises to fully 2800 feet above the level of the sea. The two prevailing rocks are *greenstone* (dolerite) and *claystone*. The greenstone is sometimes basaltic, sometimes porphyritic, or amygdaloidal. The claystone is red, yellow, brown, and green. It alternates with the greenstone, in beds of varying thickness. The beds of greenstone and claystone of the group all incline or dip towards a central point of the group, rendering it probable that the islands are but portions of one whole. The upper surface of the greenstone is slaggy, showing that the mass had been in a state of igneous solution. There are two principal varieties of greenstone; one porphyritic, with crystals of glassy felspar, the other without the porphyritic structure. In some of the islands there are beds of *pitchcoal*, associated with fire clay, slate clay, and sphærosiderite, resting upon the trap, and covered by it. The beds of greenstone and slate clay are often traversed by veins or dikes of basaltic and porphyritic greenstone, which, however, do not appear to occasion any change in them; but the greenstones are changed in position and direction by the invasion from below of a conglomerated rock, a kind of trap tuffa. The trap rocks of the Faroes have been long celebrated, on account of the splendid zeolites they afford: some species of this beautiful family appear to be daily forming. The chloropœite, peridote, and precious opal, are also productions of this insular group.

SUBJECT. 2. Botany.

3178. *Denmark and Sweden, Norway and Lapland, the Faroe Islands, and Iceland*, — the latter giving a name, indeed, to a plant equally common in the other countries, *Lichen islandicus*, or *Iceland Moss* (*fig. 414.*), — may be considered under one head, so far as regards

414

ICELAND MOSS.

their vegetable productions; for it is difficult to draw an exact line of demarcation, and even of these the very nature of our work does not allow us to treat much at large: this is the less to be regretted, because the classical works of Linnæus and Wahlenberg are in the hands of every botanical student; and they contain a mine of valuable information, in the *Flora Lapponica* and *Suecica* of both these authors, and a fund of interesting and delightful narrative in the *Lachesis Lapponica* of the great Swedish naturalist. The various writings of Ceder, Vahl, and Hornemann afford much useful matter relative to the plants of Denmark. The vegetation of a great portion of these countries may also be considered the same as that of the more northern and mountainous parts of Great Britain already detailed. Yet, as the northern regions of the continent of Europe present an alpine and arctic vegetation, in a much more perfect degree than islands, we should scarcely do justice to our subject, did we not offer some remarks on the distribution of the vegetable productions of a portion of that more interesting and extreme northern European territory; namely, Lapland. The natural boundaries of this country are represented by Wahlenberg as formed by some low mountains, about 500 feet in height, at a distance of from five to eight Swedish miles from the extremity of the Gulf of Bothnia. They present no naked summits, but are covered with forests of Spruce Fir* (*fig. 415.*): these may be considered as the last of the subalpine ranges in northern Europe. Commencing in the south-east, a little beyond the lake Kemistrask, in lat. 67°, it tends towards Upper Tornea, and near to Ofover Calix in the west; stretches south to Edifers, in Lulea; and reaches its southernmost point at the Tafvelsjon, in Umean Lapland, lat. 64°. This mountain chain exhibits *Calla palustris* (*fig. 416.*), (a plant of a poisonous family, closely allied to our *Arum maculatum* or Wake-robin, and to the *Caladium esculentum* of the tropics; and, as with them, a kind of bread called *Missenbröd*, or the bread of famine, is made by the Laplanders from the roots); Sweet gale*, common Speedwell*, Ox-eye*, Meadow Fescue-grass*, and *Carex stellulata*.* The Birch* there produces its leaves in the beginning of June.

3179. *The inferior and woody district of Lapland* has its upper limit at Sondankyla in Kemean Lapland, between Kengis and Munoniska in Tornea, at Jockmock in Lulea, and

* The names marked with an asterisk are those of plants also found in Britain.

at Falstrak, in Umean Lapland; and it yields, besides, the Spruce Fir, the Meadow Trefoil*, the *Lysimachia thyrsiflora**, Lily of the Valley*, and White Water Lily*, which grow abundantly. Some plants which are peculiarly subalpine begin to appear, as *Tofieldia palustris** and *Serratula alpina*.*

SPRUCE FIR.

streams. The culture of barley still succeeds; but scarcely beyond this line.

416

CALLA PALUSTRIS.

3181. The subalpine mountains in this region are very dry and remarkably gravelly and stony; abounding in that plant which Linnæus has so beautifully described, in his *Flora Lapponica*, as the main support of the Rein-deer, and consequently of the Laplander, *Lichen rangiferinus** (fig. 417.), or Rein-deer Moss. Ill could the Laplander subsist without the supplies afforded by that useful animal; it is his sole wealth. It yields him almost every necessary of life: it serves him instead of horse,

417

REIN-DEER MOSS.

cow, and sheep: the rein-deer supplies him with milk, butter, and cheese; draws him in sledges with great speed from place to place, over ice and snow; gives his flesh for food, his skin for clothing, his tendons for bowstrings, and, when slit, for thread, his horns for glue, and his bones for spoons. And the almost only winter food of this serviceable animal is the moss we have just mentioned, and which the deer are so fond of, that though it is commonly buried at that season under a great depth of snow, yet, by scratching with their feet, and digging with their antlers, they never fail to get at it. In short, without this lichen, both the rein-deer and the Laplander must perish. "Thus," adds Linnæus, "things which are often deemed the most insignificant and contemptible by ignorant men, are, by the good providence of God, made the means of the greatest bless-

ings to his creatures." Linnæus assures us that this lichen grows so luxuriantly in Lapland, as to be found sometimes a foot in height.

3182. *But as the hills scarcely rise to the limits of perpetual snow, about 200 or 300 feet higher than the woods are found, they are fertile in such plants as flourish in a dry and barren soil; viz., Menziesia cærulea*, Arbutus alpina*, Juncus trifidus*, Lycopodium alpinum*, Azalea procumbens*, and, though rarely, Diapensia lapponica. Here the Lichen tartareus (fig. 418.), or Cudbear, abounds, and is, both here and in Sweden and Norway,*

CUDBEAR.

collected, and exported to the dye-manufacturers. Wahlenberg distinguishes by the term "Regio subsylvatica," or partially wooded region, that where the Scotch Fir grows, but not the Spruce. This is more contracted than the other regions, and more difficult to be defined. It is not unfrequently eight Swedish miles broad in northern Lapland; in Kemea extending to nearly 70° of lat. Before the Scotch Fir ceases, the *Carex globularis* disappears, and, in the more northern parts, *Prunella vulgaris*. Within the Fir region, the beautiful *Pedicularis lapponica* appears scattered through the woods; *Viola bifolia*, and

*Thalictrum alpinum** following the course of the streams; *Salix lanata**, with its splendid golden catkins, at the margins of marshes and springs, and also *Ranunculus lapponicus*. The cultivation of barley scarcely succeeds, and the colonists are miserably poor. The Birch comes into leaf at the summer solstice. The lakes and rivers have an elevation of about 1000 feet above the level of the sea. The subalpine region still yields the Birch* (*Betula alba*), though other trees will not grow. Its upper boundary is marked by the dwarf stature of these, where they scarcely attain a height of six feet. The Aspen* (*Populus tremula*) and the Bird-cherry (*Prunus Padus*) cease before the Birch: the *Sorbus Aucuparia**, or Mountain Ash, extends as far. The Birch always in Lapland reaches to a much greater elevation and more northern latitude than the Scotch and Spruce Firs. Its limits are more easily determined; yet, on a geographical map, they are with difficulty expressed, because the Birch ascends to the alpine regions, circumscribes all the mountains, and penetrates all the lesser valleys: thus it extends almost to lat. 71° in Western Finmark, and stops but little short of the celebrated North Cape. The dry portion of this region is again the habitation of the *Lichen rangiferinus*, and of *Azalea procumbens**, *Luzula spicata**, and *Juncus trifidus**. On the borders of Russia, the Birch as well as the Scotch Fir extend even to the Northern Ocean.

3183. *The lower alpine region, or the Lower Alps, commence where the Birch ceases to exist, and where the snow, not of perennial duration, except in caves and hollows, melts before the middle of July. There the Diapensia lapponica, Silene acaulis*, and Andromeda hypnoides are found. The Salix myrsinites* and Dwarf Birch still grow erect. It is under the description of this latter plant, in the Flora Lapponica, that Linnæus has drawn so admirable a picture of the felicity of the natives of that country:—"Oh happy Laplander," he says, "who thus livest in cheerfulness and innocence, at the extremity of the habitable world! thou neither fearest dearth of provisions, nor cruel wars, which cannot reach thy shores; but which often lay waste and destroy the most flourishing provinces and cities of Europe. Here thou liest down to rest, beneath a covering of skins, free from every care, free from strife and disputes; unconscious of the very existence of envy; fearless of every thing but the thunders of the Almighty. Thou passest thy days in innocence, frequently till thou attainest the age of an hundred years; and that, too, with a happy old age, and in the enjoyment of the highest health. A thousand diseases, common to the natives of Europe, are unknown to thee. Thou livest in woods, like the birds; like them, thou neither sowest nor reapest, yet an all-bountiful Providence sustaineth thee. Thy dwelling is among the trembling foliage of the trees, and in grassy thickets; thy drink is water, pure as crystal, which neither causes intoxication, nor those jugular swellings which affect the natives of other Alps. Thy food is either fresh fish in spring, or curd produced from milk in summer, or moorfowl in autumn; or, in winter, the flesh of the newly slain rein-deer, without bread or salt, one dish being an ample feast to thee! When thou risest in the morning, and hunger assails thee, thus it is satisfied, without incurring the danger of those poisons which lurk in our highly-seasoned dainties. Neither scorbutic diseases, nor intermittent fevers, nor corpulence, nor gout, destroy thy constitution; but thou possessest, to thy last moments, vigour both of body and mind! Oh, sacred Innocence, is not thy throne erected here, among the wilds of the extreme North, and in the most desolate parts of the earth? And dost thou not appear to prefer a couch made of the slender branches of the birch, to the softest down, with coverings of silk?"—Nearly the same vegetation as is met with on the Lower Alps exists upon the maritime alps of Finmark, to the most northern promontory, with this difference only, that the steep and precipitous rocks harbour more moisture and snow, and the affinity is greater with the alpine range in the higher mountains, which retain the snow during*

the whole summer, the partial melting of which creates a moist and even a boggy soil. Here, therefore, are seen the little Dwarf Willow* (fig. 419.) (*Salix herbacea*), *Ranunculus*

419

DWARF WILLOW.

glacialis and *nivalis*, *Pedicularis hirsuta* and *flammea*, *Stellaria biflora*, and *Erigeron uniflorum**; plants eminently alpine, and peculiar to those situations.

3184. Beyond these is the region of perpetual snow. Towards the Norwegian Ocean, another form of the alps presents itself; lofty mountains without any plains, circumscribed with very narrow zones, which Wahlenberg defines as the more elevated sides of the alps, reaching nearly to the limits of perpetual snow, consequently always irrigated with snow water: they nourish a few, and those marshy, plants. The *Ranunculi* (Crowfoots) principally abound.

3185. The lower, or less elevated, sides of the alps, generally destitute of perpetual snow, yield the Dwarf Birch* in the moister spots; and, on the drier, *Andromeda hypnoides*, the Alpine Speedwell*, *Juncus bifidus**, and the Procumbent Azalea.*

3186. The bases of the alps are where the Birch grows, but no Pines. Among the Birches, scarcely six feet high, the Purple alpine Saxifrage*, with *Saxifraga nivalis* and *cernua*, abound in the moist and precipitous places, and, in those that are more dry, *Aspidium Lonchitis*. The lower portion of this zone affords tall birches, such as are found in the more northern regions, only in the inmost recesses of the deep bays, and, beneath them, *Aspidium Filix Mas**, *Osmunda Struthiopteris*, the Blue Alpine Sowthistle*, and the Red Currant.*

3187. The maritime alps include the islands and promontories; so exposed to the winds that they derive their alpine character more from their peculiar situation than from their elevation above the level of the sea: and so bare are they of trees and shrubs, that even the Juniper will not succeed there. They are almost equally destitute of the more alpine shrubs, such as *Andromedas*; but they are adorned with succulent alpine plants, such as *Saxifraga oppositifolia**, *Silene acaulis**, and *Dryas octopetala*. Near the shore occur some productions of the alps of the south of Europe, such as *Erigeron alpinum**, *Sedum villosum** and *Gentiana involucrata*, which in Lapland are found nowhere inland. The Norwegian alps nourish numerous annual plants; but the dryer ones of Sweden, remote from the sea, are remarkable for the little alpine shrubs, particularly *Azalea lapponica*, which scarcely occurs in Norway; *Salices* alone, such as *S. myrsinites**, occupying their place.

3188. The subalpine spots and valleys are marked by the presence of the Pine; but the most extended Fir forests are only found at the heads of the deep inlets of the sea, in narrow ravines, sheltered by the loftiest mountains. These valleys enjoy a much milder climate than all the rest of Lapland: there are found the *Convallaria verticillata**, *Campanula latifolia** and *Fragaria vesca**, in abundance; but no alpine plants will grow, except the Starry Saxifrage* (*Saxifraga stellaris*) along the margins of the rills.

3189. A more interesting account of the vegetation of Lapland, at different elevations, is published by Sir J. E. Smith, in the Appendix to the *Lachesis Lapponica* of Linnæus. It

is translated from the Swedish of Dr. Wahlenberg; his "Observations made with a view to determine the height of the Lapland Alps." (1.) On approaching the Lapponese mountains (*Fjäll*), we first reach the line where the Spruce Fir ceases to grow. This tree had previously assumed an unusual appearance; that of a tall slender pole, covered from the ground with short, drooping, dark branches: a gloomy object in these desolate forests! The Arctic Raspberry* (fig. 420.) (*Rubus arcticus*) had already, before we arrived at this point, ceased to bring its fruit to maturity. With the Spruce we lose the Cinnamon Rose (*Rosa cinnamomea**), and the Twin-leaved Solomon's Seal (*Convallaria bifolia*), &c.; and the borders of the lakes are stripped of their ornaments of Reeds (*Arundo Phragmites**), *Lysimachia thyrsiflora**, *Galium boreale**, and *Carex globularis*. Here is the true station of the Arctic Colts-foot (*Tussilago nivea*). The last beaver-houses are seen in the rivulets; and no pike nor perch is to be found in the lakes higher up. The boundary of the Spruce Fir is 3200 feet below the line of perpetual snow, and the mean temperature 37° of Fahrenheit.

3190. (2.) Scotch Firs* (*Pinus sylvestris*) are still found, but not near so tall as in the lower country. Their stems here are low, and their branches widely extended. Here are seen

420

THE ARCTIC RASPBERRY.

the last of *Ledum palustre**, *Salix pentandra**, *Veronica serpyllifolia**, &c. The bogs have already a very sterile appearance. Near the utmost boundary of the Scotch Fir grows *Phaca alpina*. Higher up, hardly any bears are to be met with; and the fruit of the Bilberry* does not ripen well. The Gwiniad and Grayling, two species of the Salmon tribe, soon after disappear from the lakes. The upper limit of this zone, at which the Scotch Firs cease, is 2800 feet below the line of perpetual snow, and the mean temperature about 36° Fahrenheit. A little short of this point, or about 3000 feet before we come to perpetual snow, Barley will not ripen; but small farms, the occupiers of which live by grazing and fishing, are met with as far as 400 feet higher; for instance, Naimaka in Enontekis, and so far also potatoes and turnips grow large enough to be worth cultivating.

3191. (3.) *Beyond this, the dwarf and stunted forests* consist only of Birch.* Its short, thick stem, and stiff, widely-spreading, knotty branches, seem prepared to resist the strong winds from the Alps: its lively light green hue is delightful to the eye, but evinces a weakness of vegetation. The birch forests soon become so low, that they may be entirely commanded from the smallest eminence. Their uppermost boundary, where the tallest of them do not equal the height of a man, is 2000 feet below the line of perpetual snow. This zone is therefore much wider than the preceding. Long before its termination, the Alder* (*Alnus incana*), the Bird-cherry* (*Prunus Padus*), and the Aspen (*Populus tremula**), were no more to be seen. A little before the Birch ceases, we miss the Mountain Ash*, which for some time had not presented us with any fruit; the Arctic Bramble* (*Rubus arcticus*) was already likewise barren; the Ling* (*Erica vulgaris*), *Aconitum Lycoctonum*, &c. Where the birch forest becomes thinner, the reflection of the heat from the sides of the mountains is the strongest. Here, in many spots, we find the vegetation of *Sonchus alpinus**, *Struthiopteris*, and *Aconitum Lycoctonum* remarkably luxuriant. The drier spots now become covered with the Iceland Moss* (*Lichen rangiferinus*): *Tussilago frigida* and *Pedicularis sceptrum-carolinum* extend to the utmost boundary of the Birch. Thus far only the Char (*Salmo alpinus*) is found in the lakes, and higher up all fishing ceases.

3192. (4.) *All mountains* above this limit are called Fjäll (alps). Near rivulets, and on the margin of bogs only, is found a little brushwood, consisting of *Salix glauca**, whose grey hue affords but little ornament to the landscape. The lower country is covered with the dark-looking Dwarf Birch* (*Betula nana*), which still retains its upright position. A few Juniper bushes*, and some plants of *Salix hastata**, are found scattered about. Every hill is covered with *Arbutus alpina**, variegated with *Andromeda cærulea**, and the Wintergreen* (*Trientalis europæa*). The more boggy ground is decorated with *Andromeda polifolia** in its greatest beauty, and *Pedicularis lapponica*. On the sides of the mountains, where the reflected heat bears most power, grow *Veronica alpina**, *Viola biflora**, *Pteris crispa**, and *Angelica archangelica*.* This zone extends within 1400 feet of the line of perpetual snow. The glutton (*Mustela Gulo*) goes no higher than this. The berries of the Cloudberry (*Rubus Chamæmorus*) still ripen here, but not at a greater elevation.

3193. (5.) *Now no more brushwood* is to be seen. The white *Salix lamata** is not above two feet high, even about the rivulets, and *Salix myrsinites** is of still humbler growth. The Dwarf Birch* occupies the dry spots, and creeps entirely upon the ground. The hills are clothed with the rather brown than green *Azalea procumbens**, and *A. lapponica*, which give this zone its most peculiar feature. Verdant spots between the precipices, where the sun has the greatest power, produce *Lychnis apetala**, *Erigeron uniflorum**, *Astragalus leontinus* and *montanus*, with *Ophrys alpina*. In boggy places, *Aira alpina**, *Carex ustulata**, and *Vaccinium uliginosum** are observable. The only berries, however, which ripen at this degree of elevation are those of the Crowberry* (*Empetrum nigrum*); but these are twice as large as what grow in the woodlands, and better flavoured. The upper boundary of this zone is 800 feet below the line of perpetual snow. The Laplanders scarcely ever fix their tents higher up, as the pasture for their rein-deer ceases a very little way above this point. The mean temperature is about 34° Fahrenheit.

3194. (6.) *Next come the snowy Alps*, where are patches of snow that never melt. The bare places between still produce a few dark shrubby plants, such as the Crowberry*, destitute, however of fruit; *Andromeda tetragona* and *hypnoides*, and *Diapensia lapponica*. Green precipices, exposed to the sun, are decorated with the vivid azure tints of *Gentiana tenella* and *nivalis**, and *Campanula uniflora*, accompanied by the yellow *Draba alpina*. Colder and marshy situations, where there is no reflected heat, produce *Pedicularis hirsuta*, and *Dryas octopetala*.* This zone reaches to within 200 feet of the limits of perpetual and almost uninterrupted snow.

3195. (7.) *Beyond it, the eternal snows* begin to cover the ground, and we soon arrive at a point where only a few dark spots are here and there to be seen. This takes place on the alps of Quickjock at the elevation of 4100 feet above the sea; but nearer the highest ridge, and particularly on the Norway side of that ridge, at 3100 feet. Some few plants with succulent leaves are thinly scattered over the spongy brown surface of the earth, where the reflected heat is strongest, quite up to the line of uninterrupted snow: these are *Saxifraga stellaris**, *rivularis**, and *oppositifolia**; *Ranunculus nivalis* and *glacialis*; *Rumex digy-*

nus *, *Juncus arcuatus* *, and *Silene acaulis*. The mean temperature, at the boundary of perpetual snow, is $32\frac{1}{4}^{\circ}$ of Fahrenheit.

3196. (8.) Above the line of perpetual snow, the cold is occasionally so much tempered, that a few plants of *Ranunculus glacialis*, and other similar ones, may now and then be found in the clefts of some dark rock rising through the snow. This happens even to the height of 500 feet above that line. Farther up, the snow is very rarely moistened, though some umbilicated Lichens (*Gyrophoræ*), &c. still occur in the crevices of perpendicular rocks, even 2000 feet above the line of never-melting snow. These are the extremes of vegetation, where the mean temperature seems to be 30° Fahrenheit. The Snow Bunting (*Emberiza nivalis*) is the only living being that visits this elevated spot.

SUBJECT. 3. Zoology.

3197. The native Zoology, in conjunction with that of Norway, has been ably illustrated by the celebrated Danish naturalist Müller, and shows that the fauna of those kingdoms is much richer than their northern and ungenial climate would lead us to imagine. The total number of land quadrupeds, including the domestic species, is forty-one. Among these we find the lynx, the glutton, the beaver, the leming, and the flying squirrel; together with four of the largest deer inhabiting Europe; namely, the elk, the stag, the rein-deer, and the fallow-deer.

3198. The Elk (*Cervus Alces*) (fig. 421.) of Europe is the same with the Moose-deer of America: it is found

THE ELK.

in Europe between latitude 53° and 65° : in size it is higher than a horse; and, to support the enormous weight of its horns, sometimes nearly fifty pounds, its neck is short, thick, and very strong. Its movements are rather heavy: it does not gallop, but ambles along, the joints cracking so much at every step, that the sound is heard to some distance. During winter it chiefly resides in hilly woods; but in summer it frequents swamps and the borders of lakes; often going deep into the water, to escape the stings of gnats, &c., and to feed without stooping. With its enormous horns it turns down branches of trees, to feed upon the bark, with great dexterity; and these are also used as shovels, to get at pasture when covered with snow. The young are so simple and fearless, that they will suffer themselves to be taken by the hand. An unusually large elk, killed in Sweden, is said to have weighed 1200 lbs. These animals do not now appear to be employed in any domestic office.

3199. The Wolverine, or Glutton, is one of those animals whose history has long been shrouded in fiction and romance. It is only now that its true habits have been given to the world, by that enterprising traveller, Dr. Richardson. The Wolverine of America, generally considered the same with the European Glutton, feeds chiefly upon beasts that have been accidentally killed; but it will hunt smaller animals, as meadow-mice, marmots, &c. and occasionally attack disabled animals of a larger size. In its gait it resembles the bear; and, although not fleet, is very industrious. Mr. Graham observes, that it does more damage to the small fur trade than all the other rapacious animals conjointly; as it will follow the martin-hunter's path round a line of traps extending sixty miles, and render the whole unserviceable, merely to get at the baits. Yet it flies from the face of man, and may be killed with a stick. Its total length is not more than two feet and a half.

3200. The Birds, according to Müller, amount to 232 species: the greater part of these

422

THE MOCKING JAY.

are common to the northern countries of Europe; but the Mocking Jay (*Corvus infaustus* Lin.) (fig. 422.), and the Nutcracker (*Nucifraga caryocatactes*) are unknown in Britain and more southern latitudes: the bill of the latter is shaped much like that of a woodpecker, and is said to be used for breaking the shells of nuts: whence its name. The species of fish, from the maritime nature of the region, are numerous.

3201. Domestic animals. It appears that the breeds called the lesser and greater Danish Dogs are much more common in other countries than in that from which they have been named. The horses and cattle are of very large-sized breeds, generally called the Holstein. The greatest num-

ber of oxen seem to be bred in Jutland: they are fattened, during summer, in the rich marshes of Holstein, and driven, in the autumn, to Hamburg.

SECT. III. Historical Geography.

3202. During the early period of the middle ages, the swarms of pirates sent forth by Denmark spread desolation and terror to the remotest extremities of Europe. Canute king of Denmark even ascended the English throne in 1017; upon which, however, his posterity were unable to support themselves; but, during the whole of the Anglo-Saxon period, the kingdom had to maintain a hard and doubtful struggle against the Danish invaders. Denmark, at the same time, carried on frequent wars against the contiguous districts of Germany

and Poland, and often held sway over large portions of them. But her most brilliant era was the reign of Margaret of Waldemar, surnamed the Semiramis of the North, who, by her courage, popularity, and address, succeeded in effecting the union of Calmar, which placed on her head, and on that of her nephew Eric, the crown of the three northern kingdoms of Denmark, Sweden, and Norway.

3203. *The decline of Denmark* began in the thirteenth century, under the violent and tyrannical reign of Christian I. The sanguinary course by which he sought to punish an insurrection of the Swedes roused all the dormant spirit of that brave people, who found a deliverer in Gustavus Vasa, and were finally freed from the Danish yoke. During the two following centuries, Sweden, led to victory by a succession of heroic monarchs, rose to the highest pitch of military glory; while Denmark, always defeated, was stripped of many of her most important territories, and sunk into the rank of a secondary state. Still she successfully cultivated maritime commerce and shipping, and obtained some valuable possessions in the East and West Indies.

3204. *In the great crisis produced by the conquests of Napoleon*, Denmark was thrown into an unfortunate predicament. Placed, as it were, at the point of collision between France and Russia, she could with difficulty escape being crushed between them. Circumstances of peculiar hardship threw her into the arms of France, to whose cause she adhered, and at the great contest which ended in the downfall of Napoleon, she became a victim. First, she was deprived of Norway, that it might be ceded to Sweden, and that Russia might retain Finland. Denmark received in return Swedish Pomerania as an inadequate compensation. Next, she was required to exchange Pomerania for Lauenburg, a territory of still inferior extent and value; but, as it borders on Sleswick and Holstein, it has rendered her dominion more compact, and extended her frontier to the Elbe, so that she is perhaps rather a gainer by the exchange.

SECT. IV. *Productive Industry.*

3205. *The agriculture of Denmark* is conducted under considerable disadvantages both of climate and soil. The climate, though not subject to severe frost or intense cold, is chill and damp; and the land consists in a great measure of sand and marsh. Every part of the kingdom, however, is capable of some cultivation, and occasional tracts of luxuriant fertility occur. Such are the islands of Zealand, Laaland, and Falster; and, in a still greater degree, the sea-coast of Sleswick and Holstein; for the interior is arid and sandy. The industry of the peasant in Denmark Proper suffers many severe checks; he has been but recently emancipated from personal bondage, and is still subjected to many feudal usages. Life-leases, under which the payment is made in produce or personal services, are common. The proprietors are generally embarrassed, and unable to expend much on the improvement of their lands. The farmers of Holstein and Sleswick carry on the process of cultivation with great skill and activity, and are considered almost on a level with those of England. The chill moisture of the climate is less favourable to the cultivation of wheat than of barley, rye, and oats; all of which afford a large surplus for exportation. The rearing of cattle is also an extensive branch of industry, though too little attention has been paid to the improvement of the breeds, unless on the west coast of Sleswick, on whose moist and rich meadows is produced what bears a high reputation under the name of "Hamburg beef." Over all Denmark, the produce of the dairy forms the basis of a large export trade. The value of all the land in Denmark, according to Mr. Smith, has been rated officially at 104,000,000 dollars.

3206. *The manufactures of Denmark* are extremely rude, and consist chiefly in working up the flax and wool of the country in a coarse form for domestic use. A great proportion also of the wool is exported. Government have employed great efforts to raise Denmark to the rank of a manufacturing country; and some fabrics in the different kinds of cloth, brandy, sugar-refining, &c., have, under its patronage, been set on foot in the large towns; but these are all languishing, and with difficulty support foreign competition.

3207. *The commerce of Denmark* is in a more active state than the other branches of industry; though it is still not such as to give her a prominent place among the powers of Europe. The basis consists in the exportation of its raw produce. The grain exported from Jutland and the islands, at an average of seven years to 1827, amounted to 29,000 quarters of wheat; 141,000 quarters of rye; 190,000 quarters of barley; 43,000 quarters of oats. The rye was chiefly exported to Norway, to be used as bread-corn, and the barley to be employed in distillation. The value of these articles amounted, in 1825, to 476,000*l*. That of butter and cheese exported was, in the same year, 276,000*l*. Holstein and Sleswick, called the duchies, exported at an average also of seven years, 78,000 quarters of wheat; 55,000 of rye; 75,000 of barley; 130,000 of oats. The value of butter, cheese, and salted meat, is still greater. Denmark, from its situation between the northern and middle states, has a considerable carrying trade of the bulky articles produced by the former; and has also a good deal of ship-building. Both the whale and herring fisheries are likewise carried on to some extent.

SECT. V. *Political Geography.*

3208. *The constitution of Denmark*, originally formed on the basis of the most complete feudal independence, to the extent of rendering the monarchy itself elective, underwent a complete change in 1660, when Frederick III. had the address to obtain an act by which the crown was declared hereditary, and himself invested with supreme and absolute power. The sway of the Danish princes has, however, been exceedingly mild and popular, and their despotic power exerted in a manner beneficial to the people, as it limited the oppressive rights exercised by the nobles. These, however, continue to be extremely obnoxious; and it is only within a very few years that the body of the people were emancipated from a state of personal slavery. The nobles are few in number, consisting only of one duke, nineteen counts, and twelve barons. The king himself presides at the supreme national tribunal.

3209. *The revenue* has been lately stated, by official documents, at 1,479,000*l.* There is a nominal debt of 15,000,000*l.*; but the interest paid upon it is small.

3210. *The military and naval establishments* are on a scale suited to a greater country than what remains of Denmark. The army is kept up to nearly 40,000 regular troops and 60,000 militia. The navy has not recovered from the severe shock which it received during the last war: at present it consists of six ships of the line, six frigates, and four corvettes, besides smaller vessels. The sailors being all registered, no difficulty is ever found in manning the navy.

SECT. VI. *Civil and Social State.*

3211. *The population of Denmark*, according to the census at the end of 1828, was found to amount to 1,992,729; of which 1,521,278 were in its ancient domain of the islands, Jutland and Sleswick, 374,745 in Holstein, 35,640 in Lauenburg, 49,826 in Iceland, 11,240 in Greenland and the Faroe Islands.

3212. *National character.* The Danes are generally quiet, tranquil, and industrious. The inhabitants of the towns, who are chiefly engaged in trade, have a great share of the patient, thrifty, and persevering habits of the Dutch. The peasantry, poor and oppressed, are beginning, however, to raise their heads; and the nobles, no longer addicted to those rude and daring pursuits which rendered them once so formidable, live much in the style of opulent proprietors in other European countries.

3213. *The Lutheran religion* was early and zealously adopted in Denmark, to the extent, indeed, of granting toleration to no other; but the liberal principles now diffused throughout Europe have made their way fully into that country. Science was at one era somewhat brilliantly patronised in Denmark. The observatory at Orienbaum was the theatre of many of the most important modern observations; and Tycho Brahé ranks as one of the fathers of modern astronomy. The fame of Denmark in this study has diminished; but her writers, though little known to the rest of Europe, are said to have displayed considerable activity in investigating the antiquities of the North. More recently, Œschenslager and other writers have introduced a school of poetry and dramatic literature, founded upon that of the modern German. The government has bestowed a very laudable attention on the general education of its people, and has even passed a law, requiring every child of a certain age to be sent to school. The schools, on the plan of mutual instruction, amounted, in 1829, to 2500, and more were in progress.

SECT. VII. *Local Geography.*

3214. *The local divisions of continental Denmark* present little variety, in consequence of the uniformity of its surface, and the small number of considerable cities. With the exception, indeed, of a few leading points, there is no country whose interior excites less interest, or is less the object of resort to strangers. Its divisions are, Zealand and the other islands; Jutland, Sleswick, Holstein, Lauenburg; with the remote territories of Iceland, Greenland, and the Faroe Islands.

3215. *Zealand* is a flat, fertile, and extensive island, separated from Funen by the Great Belt, and from Sweden by the Sound. Including the capital, and chief seats of trade, it forms the most important part of the Danish dominions.

3216. *Copenhagen* (fig. 423.), (in Danish, Kiøbenhavn, or the "merchant port,") the capital of Denmark, is

situated on the east coast of Zealand, with the island of Amak opposite to it, and several little lakes in its vicinity. Its walls enclose a circuit of five miles, a great part of which, however, is covered with open spaces, and with the harbour and docks. The houses, with a few exceptions, are built of brick, plastered over, and painted in different colours. The number of houses is estimated at 3300, and the inhabitants at about 105,000, which implies that the houses are lofty, and contain many families in each. The city is divided into three parts: the old town, which contains the greater part of the population; the new town, in which are all the finest edifices; and the port, or Christian's Haven. In the midst of the principal square is the bronze statue of Frederick V., weighing 45,000 lbs., and which cost 400,000 rix-dollars. This square, with the adjoining one called the King's Mark Place, surrounded by the palace of Charlottenburg, the theatre, the principal hotel, and other stately buildings, forms the handsomest part of Copenhagen. The cathedral was destroyed during the bombardment by the English, and is left in ruins; but the Frue Kirke is an elegant Grecian edifice, 215 feet by 180, with a Doric portico, and for which Thorwaldsen is preparing statues of the apostles and evangelists. The palace of Rosenborg was built from a design of Inigo Jones; and, though now unoccupied, contains an extraordinary display of jewels, precious stones, and porcelain. The collections in science and art are equal to those of the greatest capitals. The king has a library of 250,000 volumes, with numerous manuscripts illustrative of the history and literature of the North, as well as those brought by Niebuhr from the East; an extensive museum of northern antiquities; a gallery of pictures, comprising some fine specimens of the greatest masters, and a numerous collection of engravings. The arsenal is said to equal that of Venice in beauty, and to surpass it in extent. The mint, constructed on the plan of Boulton and Watt, throws off 200 pieces in a minute.

3217. *The other towns in Zealand* and the islands are of comparatively small magnitude. Roeskilde, the ancient capital of Denmark, which contained once thirty convents and thirty churches, is now remarkable only for its Gothic cathedral, in whose vaults are deposited the remains of the kings of Denmark. Several of the monuments are fine. Elsinore, with its castle of Cronborg, is important from its situation on the Sound, which being commanded by the castle, the government is enabled to levy what are called the Sound dues. The passage to Helsingborg, in Sweden, may be made in half an hour. Elsinore, from its favourable situation and good roadstead, carries on a considerable commerce, and contains, among its inhabitants, many British, and also many Jews, and even Mahometans. It has a handsome cathedral, with some fine tombs. Population 7000. At Cronborg is shown the chamber in which the unfortunate Matilda was confined. This castle commands a noble view over the sea, the islands, and the opposite coast of Sweden. The terrace from which these are viewed recalls to the English reader the first scenes of Hamlet, the tradition of whose story is still prevalent here. Soroe, in the interior, surrounded by a fine country, has a noble academy; and contains the tombs of Eric, Canute, and other princes. Odensee, the capital of Funen, has a college, and is rather a thriving town, with manufactures of woollen and soap. Nyeborg, in Zealand, and Corsoer, in Funen, derive some importance from their situation on the passage of the Great Belt; and Middelfarth, in the latter island, from the passage of the Little Belt.

3218. *The towns of Jutland* are of small interest, and have been little observed, with the exception of those which lie on the high road from Hamburg to Copenhagen. Aalborg, near the northern extremity, is the seat of one of the four bishoprics; and, being situated on a narrow arm of the sea, with a good harbour, carries on some trade. Aarhus, on the eastern coast, is the seat of another bishopric; and, being in the midst of a fertile country, exports some grain. Colding derives some importance from its vicinity to the passage of the Little Belt. Wiborg and Ripen are also deserving of mention.

3219. *In Sleswick*, the city of that name is agreeable, though irregularly built. Its cathedral, with numerous monuments of ancient dukes, is viewed with interest. Flensburg, on a deep and winding *haaf*, or bay, with an excellent harbour, possesses a much greater commercial importance, while it carries on the communication with the Baltic. Tonningen, on the other side, near the mouth of the Eyder, communicates with the countries situated round the German Ocean; and, by the canal of Holstein, it has now a water communication with the Baltic.

3220. *Holstein*, the most southern province of Denmark, ranks as part of the German empire, to which it once belonged, and gives to the king of Denmark a vote in the diet. Reaching to the Elbe, and being more in the commercial circle, it has a considerably brisker trade than the northern or peninsular territory. Altona, a few miles below Hamburg, is a repetition of that city on a smaller scale; having 25,000 inhabitants, busily employed in the commerce of the Elbe, in shipbuilding, and in several manufactures. Gluckstadt, about twenty miles lower, though inferior in extent, is a handsome and regular town, with considerable naval establishments. Kiel, on the eastern or Baltic coast, has an excellent harbour, and derives importance from its situation at the extremity of the canal which connects the

eastern and western seas. Lauenburg, a level tract, intersected with several small lakes, though it rounds the Danish borders, does not possess much importance, either in itself or its little capital.

3221. *Iceland*, an appendage of the Danish crown, unimportant in a political view, but very interesting from its physical and moral aspect, is situated in the Northern Ocean, on the border of the arctic circle, and at the farthest verge of the civilised world. It is a large island, 220 miles in length, and 210 in breadth; containing about 40,000 square miles. Iceland belongs, by its situation, to the polar world; and the mountain chains, from 3000 to 6000 feet high, with which it is every where intersected, give it a still more severe and stern character. Barley is the only grain that can be raised, and this only in patches; cabbages, and a few other imported vegetables, may be produced, but by no means in perfection. The dependence of the inhabitants is chiefly upon the abundance of fish which the surrounding seas afford; so that the interior, comprising about half of the island, is a desert of the most dreary character.

3222. *The mountain phenomena of Iceland* are very striking, and have excited the wonder of all Europe. According to Glieman, the jokuls, or hills covered with ice, rise to the following heights: Oerefe, 6240 feet; Snafell, 4572; Findfiall, 5368; Hecla, 5210; Eyafiall Oester, 5794. All these mountains are, at the same time, glaciers capped with ice which never melts; but these glaciers consist not, like those of Switzerland, of great masses sloping down from upper regions of the mountains to the valleys; they are the snows of winter melted and frozen where they fall. Beneath this mantle of ice and snow burns a perpetual fire, which in every part of the island bursts forth in the most strange and fearful phenomena. Hecla (*fig. 424.*), with its flaming volcano, is the most celebrated; but its eruptions, of which

424

HECLA.

six have occurred in the course of a century, are at present suspended. The crater, when reached by Sir George Mackenzie, was found not to be more than 100 feet in depth, with a large mass of snow in the bottom, and the thermometer stood at 39°. In many places in the vicinity, however, the heat was much higher, and in some rose to 144°. "Fantastic groups of hills, craters and lava, leading the eye to distant snow-covered jokuls; the mist rising

from a waterfall; lakes embosomed amid bare bleak mountains; an awful and profound silence; lowering clouds; marks all around of the furious action of the most destructive of the elements, gave to the region a character of desolation scarcely to be paralleled." There are six other volcanoes, which, in the course of a century, have emitted twenty eruptions; but no great quantity of lava has ever issued from any one orifice.

3223. *The Geysers* form a phenomenon strikingly characteristic of Iceland, and rank with the most extraordinary that are produced on any part of the globe. They consist of fountains, which throw up boiling water, spray, and vapour, to a great height into the air. The eruptions are not continuous, but announce their approach by a sound like that of subterraneous thunder; immediately after which, a column of water, accompanied with prodigious volumes of steam, bursts forth, and rushes up to the height of fifty, sixty, ninety, or even a hundred and fifty feet. The water soon ceases; but the spray and vapour continue to play in the air for several hours, and, when illuminated by the sun, produce the most brilliant rainbows. The largest stones, when thrown into the orifice, are instantly propelled to an amazing height, and, remaining often for some minutes within the influence of the steam, rise and fall in singular alternation. Stones thrown into the fountain have the remarkable effect of acting as a stimulus to the eruption, and causing it to burst from a state of tranquillity. The basin of the Great Geyser (*fig. 425.*) is of an oval form, with diameters of fifty-eight and sixty-four feet. Every spot around the Geysers is covered with variegated and beautiful petrifications. Leaves, grass, rushes, are converted into white stone, preserving entire every fibre.

425

GREAT GEYSER.

3224. *The Sulphur Mountains*, with their caldrons of boiling mud, present another phenomenon which the traveller beholds with the utmost astonishment. These

consist chiefly of clay, covered with a crust, which is hot to the touch, and of sulphur, from

almost every part of which, gas and steam are perpetually escaping. Sometimes a loud noise guides the traveller to a spot where caldrons of black boiling mud (*fig. 426.*),

CALDRON OF BOILING MUD.

largely impregnated with this mineral substance, are throwing up, at short intervals, their eruptions. That on the Krabla, observed by Mr. Henderson, had a diameter equal to that of the Great Geyser, and rose to the height of thirty feet. The situation of the spectator here is not only awful, but even dangerous; standing, as Sir George Mackenzie observes, "on a support which feebly sustains him, over an abyss where fire and brimstone are in dreadful and incessant action; having

before him tremendous proofs of what is going on beneath; enveloped in thick mists, and stunned with thundering noises."

3225. *The civil and social state of Iceland* presents features no less interesting. It was discovered about the year 840, by Nadod, a Danish pirate. After its settlement, it became a little independent republic; and the arts and literature, driven before the tide of barbarism, which then overwhelmed the rest of Europe, took refuge in this remote and frozen clime. Iceland had its divines, its annalists, its poets, and was for some time the most enlightened country then perhaps existing in the world. Subjected first to Norway, in 1261, and afterwards to Denmark, it lost the spirit and energy of an independent republic. Yet the diffusion of knowledge, even among the lowest class, which took place during its prosperous period, still exists in a degree not paralleled in the most enlightened of other nations. Men, whose outward accommodations might denote them to be little removed from the savage state, and who, in their little barks, seek, amid the storms of the surrounding ocean, a scanty provision for their families, possess an acquaintance with the classical writings of antiquity, and a sense of their beauty. The traveller finds the guide whom he has hired able to hold a conversation with him in Latin, and on his arrival at his miserable place of rest for the night, is addressed with fluency and elegance in the same language. "The instruction of his children," says Dr. Holland, "forms one of the stated occupations of the Icelandic; and while the little hut which he inhabits is almost buried in the snow, and while darkness and desolation are spread universally around, the light of an oil-lamp illumines the page from which he reads to his family the lessons of knowledge, religion, and virtue."

3226. *The Faroe Islands* compose a group in the Northern Ocean, between $61^{\circ} 15'$ and $62^{\circ} 20'$ N. lat., to the N.E. of Shetland, which they resemble. The principal are Stromsoe, Osteroe, Suderoe, and Norderoe, with the smaller islands of Naloe, Vagoe, and Sandoe. Their only wealth is produced by the rearing of sheep, fishing, and catching the numerous birds which cluster round the rocks. With the surplus of these articles they supply their deficiency of grain. Thorsharn, on Stromsoe, is the only place that can be called a town.

CHAP. XV.

SWEDEN AND NORWAY.

3227. *Sweden and Norway*, now united into one kingdom, form an extensive region, stretching from the utmost verge of the temperate zone far into the frozen range of the arctic circle. Along the north and west stretch the wide shores of the Frozen Ocean, so far as yet known. The south-west point of the kingdom borders on the North Sea or German Ocean. The Baltic and the Gulf of Bothnia enclose it on the south and east; so that it forms an immense peninsula. The isthmus by which it is joined to Russia is above 200 miles broad, but so closely barred by mountains and frozen plains, that the kingdom is nearly inaccessible, except by sea.

SECT. I. *General Outline and Aspect.*

3228. *This kingdom is of vast extent.* Its length, from the extreme point of Scania to the North Cape, is twenty-eight degrees of latitude, or 1550 miles. Its breadth is by no means proportionate, and, taken from the extreme points of the provinces of Stockholm on the east, and Bergen on the west, will little exceed 350 miles. Of this large

territory, scarcely a half can be considered as belonging to the civilised world. The Laplander, who derives his whole subsistence from the rein-deer, can hardly be included within the pale of civilised society. Even the southern districts have a rugged and repulsive aspect, when compared to almost any other European state. Forests of tall and gloomy pine stretch over the plains, or hang on the sides of the mountains; the ground for five months in the year is buried under snow; cultivation appears only in scattered patches, and was long quite insufficient to furnish bread to the inhabitants.

3229. *The mountains* consist chiefly of the dark and lofty chain of the Dofrines, which were for ages a barrier between the two separate and hostile states of Sweden and Norway but are now included within the united kingdom. It commences near Gottenburg, on a low scale, and becomes much more elevated in passing through Norway, where some of its pinnacles exceed 8000 feet. Chains of secondary elevation run through Lapland; but, in approaching the North Cape, they again rise as high as before, and face the polar seas with cliffs of prodigious magnitude.

3230. *The rivers are numerous*, Sweden being a country profusely watered; but, as they rise in the Dofrines, and traverse the divided breadth of the peninsula, they seldom attain any material length of course. The largest is the Dahl, which crosses Dalecarlia, and falls into the sea at Gefle, after a course of 260 miles. The most important as to navigation are those which form the outlet of the lakes, particularly the Gotha, reaching from the lake Wener to Gottenburg. The Glomme and the Dramme are pretty considerable rivers, running from north to south, and down which considerable quantities of timber are floated. Lapland pours a number of large streams into the head of the Gulf of Bothnia; but these are usually chained in ice, and at no time can be subservient to the purposes of agriculture or navigation.

3231. *Lakes* form the grand depositary of the surplus waters of Sweden. The Wener bears almost the character of an inland sea, and the completion of the canal of Trölvhätta, by enabling its coasts to communicate by the Gotha with Gottenburg, has given them almost the full advantages of a maritime site. The Wetter, though equal in length, covers not nearly so great an extent of ground. Mälar, or Malar, is a narrow, winding loch, or, more strictly, a bay, running sixty miles into the interior from Stockholm, to whose environs its variegated and rocky shores give a beautiful wildness. Small lakes, enclosed between hills, are of very frequent occurrence, both in Norway and Sweden.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

3232. (1.) *GEOLOGY OF SWEDEN.* — I. *Primitive rocks. Granite.* A certain part of Sweden is composed of this rock. It occurs in the mountains of Jämtland, in Herjeadalen, in Lulea Lappmark, in Pitea Lappmark. It occurs also in the plains, without any covering of other rocks, as in Upland, Westmanland, Sudermanland, and a part of East and West Gothland. It passes into gneiss and syenite.

3233. *Gneiss.* This rock is less abundant in Sweden than in Norway: it occurs in many places in Sudermanland, East Gothland, &c., with beds of copper and iron ore.

3234. *Mica slate* abounds not only in the principal, but also in the subordinate chains, and contains the greater number of the metalliferous beds met with in Sweden. It often alternates with vast beds of *primitive limestone, quartz, &c.* In the high mountain ridges, it is said, the strata of this rock, particularly in Jämtland, are generally disposed at an angle of 45° ; while in the subordinate chains they are vertical. In many places it abounds in garnets, when it is known under the name *noorka*, or *murkstein*, the *garnet rock* of geologists.

3235. *Clay slate.* This rock occurs sparingly: *talc slate*, in several quarters, occurs in considerable abundance.

3236. *Porphyry* occurs only in Smaland, where the basis is a quartz hornstone (*hallelinta*) with embedded crystals of felspar, and grains of quartz.

3237. *Primitive limestone* occurs generally in the secondary mountain chains, but seldom in the neighbourhood of the central chains. It is mixed up with hornblende, tremolite, quartz, serpentine, garnet, magnetic ironstone, and mica. It is often metalliferous, containing galena, copper, and iron pyrites.

3238. *Serpentine*, with the exception of masses in some metalliferous beds, seldom occurs pure: it is often mixed with limestone, when it occurs in primitive limestone.

3239. *Quartz rock.* It occurs either pure, and in whole mountains, as in Dahlsland, around the church of Froscog, and also the church of Bredesta, in Smaland, and many other places; or it alternates with mica slate, as in Dahlsland, and also in the metalliferous beds of Persberg and Klacka. The limestone of Danemora contains mica slate. It also occurs in veins in granite and mica slate, &c.

3240. *Porphyritic quartz.* This is granitic rock, with embedded grains and crystals of felspar: occurs in Smaland, Tornea Lappmark, &c.

3241. *Primitive trap.* Of this interesting group of rocks, the following kinds are met with; viz., *hornblende rock*, *hornblende with felspar*, and *hornblende with mica*.

3242. II. *Transition rocks.* — *Conglomerate and sandstone.* These rocks, which, in some places, are covered with transition limestone, occur in Jämtland, Tornea Lappmark, Angermanland, Dalecarlia, Schönen, islands in the Lake Wetter, East and West Gothland, Nerika, Dalarnia.

3243. *Transition porphyry.* In the parish of Elfdal, in Dalarnia. The basis is of the nature of hornstone. It rests upon transition sandstone, and is covered by syenite, porphyry, and transition greenstone.

3244. *Greywacke slate.* It lies upon sandstone, and is covered by transition limestone. It sometimes contains coal, and then passes into a kind of shale. It also contains fossil remains of marine animals.

3245. *Transition limestone.* It occurs in Gothland, Öland, Schönen, East and West Gothland, Nerika, Dalarnia, and Jämtland. In the regular succession, it lies immediately upon alum slate, but in Gothland directly upon sandstone. It is seldom covered by other rocks, excepting in West Gothland, where it is covered by clay slate and greenstone. It contains many different petrifications, as orthoceratites, ammonites, anomites, echinites, corallites, and entrochites. Its colour is commonly grey, or bluish grey, and reddish brown, often varied with veins of a green colour.

3246. *Transition trap.* It is the youngest rock of the transition class in Sweden. In Elfdal it rests upon porphyry; upon transition clay slate and alum slate in Kennekulle, Billengen, the Hunne and Halleberge, and others, in West Gothland.

3247. III. *Secondary rocks.* — *Secondary sandstone.* The mountain chain around Helsingborg, in Schönen, is composed of secondary sandstone. It contains beds of slate clay, bituminous shale, and black bituminous coal. It is conjectured to rest upon the transition sandstone and conglomerate of Schönen. This sandstone, which belongs to the black bituminous coal formation, is covered with other secondary deposits, as limestone, the age of which is not well known. The only one of these newer secondary deposits, the geognostical history of which has been made out, is —

3248. *Chalk.* This interesting formation occurs at Limhamn, near to Malmo. It encloses balls of common flint, and, at its lower part, passes into a more solid chalk and secondary limestone.

3249. IV. *Tertiary rocks.* The tertiary deposits seem to occur in some points of the land not far distant from the sea-coast; but they have not been carefully explored.

3250. V. *Alluvial rocks.* Many tracts more or less deeply covered with gravel, sand, and clay, occur in Sweden.

3251. *Mines.* The mines of Sweden have been long celebrated all over the world, and have been frequently described by travellers.

3252. *Gold and silver mines.* The Adelfors mine, which formerly yielded thirty or forty marks of gold annually, now furnishes only three or four; those of Fahlun, where copper

predominates, return annually four marks of gold and fifty marks of silver. The silver mine of Sahla, which, during the reign of Queen Christina, yielded annually 20,000 marks of silver, does not at present afford annually more than 2000 or 3000 marks.

3253. *Copper mines.* The most considerable copper mines are those of Fahlun, which is also known under the name of *Kopparberg*. The mines of Atwidaberg, in East Gothland, furnish about a sixth part of all the copper which the Swedes obtain annually from mines; those of Fahlun yield more than the half of the copper raised in Sweden. The ore at Fahlun is copper pyrites, disposed in an immense irregular-shaped mass, in mica slate: 10,200 quintals of copper are yielded by it annually.

3254. *Iron mines.* The greatest iron mines are those in the province of Upland: of these the most important are those of Skebo, of Æsterby, not far from Danemora, of Gimo, of Ronaes. Iron is mined as far north as Gellvara, which is 200 leagues to the north of Stockholm. The island of Uto, on the east coast of Upland, also affords a considerable quantity of iron. The whole mines afford annually 1,800,000 quintals of iron.

3255. *Cobalt mines.* The principal mines of this metal are those of Tunaberg, near to Nyköping, and at Awed, in East Gothland. These mines afford excellent cobalt, but the quantity is not great.

3256. *Coal mines.* Coal mines have been worked for some time in Scania, two leagues from Helsinborg, and are affording a considerable return.

3257. *Sulphur and vitriol.* The pyritical minerals of Dylta afford annually 1050 quintals of sulphur, and those of Fahlun about 100 quintals of the same substance. The vitriolic waters of Fahlun afford annually about 600 quintals of green vitriol, or sulphate of iron, and a small quantity of blue vitriol, or sulphate of copper.

3258. *Alum.* The annual produce of alum is about 42,600 quintals.

3259. *Quarries.* Sweden possesses, besides its regular mines, also valuable quarries of granite, porphyry, and marble. The porphyry quarries of Elfdal are the largest and most celebrated in Europe. Nearly all the fine modern works in porphyry are in the porphyry of Elfdal.

3260. (2.) GEOLOGY OF NORWAY AND LAPLAND. — I. *Primitive rocks.* These wild but highly interesting countries are principally composed of primitive and transition rocks; secondary rocks occur but rarely, and alluvial deposits are not so abundant as in many other less extensive regions. *Granite*, contrary to the general belief of geologists, is but a rare rock in Norway and Lapland; it even occurs but seldom in Sweden, and may be considered one of the least abundant rocks in Scandinavia. The granite frequently appears in veins traversing the primitive stratified rocks, or running parallel with beds or strata; and sometimes it can be seen spread over the surface of mica slate, as at Forvig, or irregularly associated with clay slate and diallage rock, as in the island of Mageroe. *Gneiss* seems to be by far the most frequent and abundant rock in Scandinavia, all the other primitive rocks appearing to be in some degree subordinate to it. *Mica slate* rests upon and alternates with the gneiss, but is far from being so generally distributed as that rock. *Clay slate* along with the mica slate is not of frequent occurrence. *Quartz rock*, various *hornblende rocks*, and *limestone*, occur in beds subordinate to the gneiss and mica slate. *Gabbro*, or *diallage rock*, one of the most beautiful of the older rocks, occurs in great quantity, connected with clay slate, in the island of Mageroe, and other parts of Norway.

3261. II. *Transition rocks.* This class contains, besides *greywacke*, *alum slate*, and *limestone* (which contains much tremolite), and other rocks well known to mineralogists as members of this class, the following:—1. *Granite*, which sometimes contains hornblende. 2. *Syenite*, which contains a beautiful *Labradoric* variety of *common felspar*, and numerous crystals of the gem named zircon. 3. *Porphyry*, and, associated with it, various trap rocks allied to basalt and amygdaloid.

3262. III. *Secondary rocks.* The great primitive land of Scandinavia continues onward to the extreme northern point of Norway; but in this high latitude some new formations make their appearance among the older. The sandstone quartz of Alten has been known since the publication of the travels of Von Buch. On the East, towards the Russian dominions, there is a considerable tract which differs more from the primitive formations than the sandstone quartz of Alten does. *Sandstone* and conglomerate extend across the subjacent gneiss in a horizontal position. These rocks probably belong to the *old red sandstone*.

3263. IV. *Alluvial rocks.* Old alluvium occurs on the coast, and in the interior in many of the valleys, and the new every where in greater or less quantity.

3264. *Mines. Silver.* The only mines of this metal in Norway are those of Königsberg, situated in mica slate, which formerly afforded rich returns, but of late years have yielded no profit. The *gold mine* of Edswold, in the district of Rommarge, and the mines of *lead* and *silver* in that of Jarlsberg, have been but feebly worked. The *copper mines* of Norway are principally situated in the northern division of the kingdom. The most considerable are those in the neighbourhood of Ræraas, which were discovered in the year 1644. They have afforded considerable quantities of copper: in 1805, the annual return was 7860 quintals of copper. The other mines of copper are from fifteen to twenty leagues of Dron-

them, at Quikne, Lækken, Selboe, and in the district of Christiania, at Frederiksgave or Foledal. The principal *iron mines* occur in southern Norway; and of these the most distinguished are those of Arendal and Krageroe. The mine of Laurwig, near to the town of that name, affords annually 26,000 quintals of bar iron and 6000 quintals of cast iron. The establishment of the same kind at Moss affords annually 10,000 quintals of iron in bars and cast. The same annual quantity is afforded by the mines of Baerum, Bolvig, Ulfoss, Eidfoss, Egeland, Naes, Dikkemarken Fossum, and Oudalen. Lastly, the mines of Hassel, Froeland, Lessee, and Mostmarken, furnish from 3000 to 5000 quintals of iron annually. The annual produce of the iron mines of Norway is estimated by a well-known statistical writer at about 150,000 quintals. The mines of *cobalt*, which are worked at Modum and Fossum, are extensive, but not deep. In the year 1792 they yielded 2817 quintals of ore. There is a mine of *plumbago* and *black lead* at Engledal. The mines of *alum*, which are worked in the mountain of Egeberg, near to Christiania, afford not only a sufficiency for the consumption of the Danish states, but also a considerable quantity for exportation. Norway possesses quarries of *granite*, *marble*, *millstone*, *whetstone*, *slate* and *clay*. Granite is exported to Holland; the marble and other minerals supply the Danish states.

SUBJECT. 2. Botany.

3265. *The Botany* of these countries has been noticed under that of Denmark.

SUBJECT. 3. Zoology.

3266. *The Zoology of Sweden*, the native country of the celebrated Linnæus, is so well known to naturalists, by the writings of that great man, that to them the subject is familiar. Nor does it present any thing very different in its general character from that of Denmark. The bleak and inhospitable regions of Norway and Lapland, to which nature has denied the rich and verdant pasturage of Britain, and the consequent abundance of grazing animals, are, however, the chief metropolis of the Rein-deer, whose diversified qualities are beautifully adapted for supplying such deficiencies.

3267. *The Rein-deer* (*Rangifer Tarandus* H. Smith) (fig. 428.) forms the sole riches of the Laplander, and its

THE REIN-DEER.

care is almost his only occupation. According to the season, he migrates to the sea shore, the plains, or the mountains. The rich often possess 2000 head; and the poorer seldom less than 100. The adult male, in a wild state, is even larger than a stag; but the domesticated races are somewhat smaller: the sight and scent of these creatures are astonishing, and guide them with wonderful precision through the most dangerous passes and in the darkest stormy nights of an arctic winter. To this sagacity the Laplander trusts his life with confidence; and accidents rarely happen: they draw his sledge with such amazing rapidity, that in twenty-four hours a pair of Rein-deer have been said to perform a journey of 100 miles. In a wild state they are gregarious; and, when domesticated, evince an excessive attachment to each other. During summer they are much tormented by a species of gad-fly; but the old account of the glutton falling upon them from a tree, and then devouring them, is now considered fabulous.

During life this useful animal supplies its master with labour and milk; and, when dead, every part becomes serviceable, the skin for clothing, and for boots; the horns to make utensils; the sinews for thread, and the flesh for food: the intestines are also used; and the tongue is a well-known article of commerce. Several attempts have been made to naturalise the Rein-deer in Britain, but as its principal food is two species of lichen not indigenous with us, there appears no probability of such trials ever succeeding.

3268. *The Birds* are not numerous, and, with few exceptions, differ not from those of

ICELAND FALCON.

Denmark and the other northern kingdoms. The Iceland Falcon (*Falco islandicus*) (fig. 429.) rarely wanders to more temperate climes; and a gigantic Owl (*Strix lapponica* Lin.) is a peculiar inhabitant of the dreary solitudes of Lapland: to these we may add two other species, the large Ural Owl; and the Great Snowy Owl. These formidable birds prey upon numerous ptarmigans and grouse, great numbers of which inhabit the confines of the arctic circle. The *Curruca suecica* Sw. or Blue-throated Reed Warbler, one of the most elegant birds of Europe, is not peculiar, as its name would imply, to Sweden, being common in France and Switzerland.

3269. *The insects of Sweden*, during its short summer, are very numerous; and many, enumerated by Acerbi, very beautiful; but, in autumn, nearly the whole country is terribly infested by Musquitoes, these tormenting little animals being beyond calculation more numerous in high northern latitudes than in the woods of tropical America.

SECT. III. *Historical Geography.*

3270. *The early history of Scandinavia* is deeply involved in fable and uncertainty. Ptolemy and Pliny, the best informed of ancient geographers, seem to distinguish it from "Great Germany," off the coast of which they represent Basilia, or Baltia, as a large island, though not nearly approaching to the real dimensions. The Goths were found in early possession of Sweden, and its southern provinces have been denominated Gothland; but the question, whether they were the native possessors, or entered it as conquerors, is one which can scarcely be now decided. Scandinavia has been called the "storehouse of nations;" and "the blue-eyed myriads from the Baltic coast" are supposed to have been among the most numerous of those who spread war and desolation throughout Europe. Dr. Clarke ridicules this idea, as inapplicable to a country of unbroken forests, and a slowly advancing population, making the first essays of agriculture; yet, though the population could never be great, the simple and pastoral habits of the people might dispose emigrants to seek subsistence with the sword in happier climates.

3271. *Scandinavia, first, by a series of formidable expeditions, made a figure in history* at the end of the ninth century. Harold Harfager, or the Fair-haired, the first of the great sea-kings of the North, having united the formerly independent districts of Norway under his sway, undertook triumphant expeditions against Shetland, Orkney, and the Hebrides. For several centuries the Danes and Norwegians held full possession of those islands; gave once a king to England, and formed a permanent establishment in Normandy. The defeat of Haco in Scotland, and of Harold III. in England, during the eleventh century, put an end to this maritime dominion: and the northern nations, notwithstanding their immense supply of naval stores, have never since attained to more than a secondary rank among the maritime powers.

3272. *The union of the kingdoms of Scandinavia*, in 1388, under Margaret, called the Semiramis of the North, forms a memorable era. Immediately, however, after the death of that able princess, the Swedes began to struggle for independence. But their repeated attempts to establish a separate kingdom were always defeated, till the cruel and tyrannical reign of Christian II. drove matters to extremity, and brought on a new revolution.

3273. *Gustavus Vasa*, in 1520, hoisted again the national standard in the province of Dalecarlia, and, in three years subsequently, entered Stockholm in triumph. After a long struggle, the Danes were compelled to recognise the independence of Sweden.

3274. *The reign of Gustavus Adolphus* formed a glorious era for Sweden. The protestant religion having been established under Gustavus Vasa, Sweden began to be looked to as its support when assailed by a formidable confederacy. In 1630, Gustavus took the field at the head of only ten thousand Swedes; but around this gallant band rallied all the protestant powers of Germany. The splendid victory of Breitenfeld humbled the house of Austria, and re-established the civil and religious liberties of the empire. Even after his fall, in the glorious field of Lutzen, his generals continued to wage that desperate war of thirty years, which was necessary to compel the catholic league finally to renounce its pretensions. Sweden, at the peace, obtained Pomerania, and other important possessions in Germany; and continued, till the end of the seventeenth century, to exercise a powerful influence on the affairs of Europe.

3275. *The victories and reverses of Charles XII.* threw a wild and romantic lustre around Sweden, which terminated, however, in the loss of her station and greatness. Being defeated at Pultowa, by the Czar Peter, and driven to seek shelter from the Turks at Bender, he was obliged to purchase peace by the sacrifice of Livonia, and others of his finest provinces. The influence of Sweden was thenceforth confined within its own barren limits, and it ranked with difficulty as a power of the second order. The only remarkable change in the course of the century was produced by the revolutions of 1772 and 1789, when Gustavus III. succeeded in converting the government into an absolute monarchy, though, in other respects, his reign was advantageous to Sweden.

3276. *The election of Bernadotte*, one of Bonaparte's commanders, to fill the throne, left vacant through the rash conduct of the legitimate monarch, made a great change in the relations of Sweden. To conciliate his new subjects, he restored in full plenitude the representative constitution, which had been reduced to a mere shadow. Having joined the confederacy against his former master, he received Norway in compensation for the loss of Finland, and had thus a more compact and defensible territory. The Norwegians exclaimed, not without some reason, against this compulsory transference; yet Denmark had deprived them of their free constitution, which they now regained, and had in so many respects depressed the country, with the view of concentrating every thing at Copenhagen, that the connection now terminated has been considered the bane of Norway.

SECT. IV. *Political Geography.*

3277. *The constitution of Sweden* is one of the few in Europe which has always preserved some portion of that representative system which had been formed in remote ages.

Towards the close, indeed, of the last century, it was reduced, by Gustavus III., to little more than a form. Bernadotte, however, an elected monarch, without any national claim, was obliged to court the favour of the nation, and, with that view, to re-establish the rights of its ancient diet. This is now rather an antique and cumbrous form of legislature, consisting of four orders; the nobles, the clergy, the peasants, and the burghers; who sit and vote in separate houses.

3278. *Of these houses*, that of the nobles consists of about 1200 members; the head of each family being, by inheritance, its legal representative. They are divided into three classes: — *herra*, counts, barons, &c.; *reddar*, knights; and *sivena*, or gentlemen who, though without any title, have received letters patent of nobility. The house of clergy consists of the archbishop and all the bishops; while the rest of the ecclesiastical body is represented by deputies. The burghers are chosen by the towns, every freeman who pays taxes having a vote: they form an independent body, partly, perhaps, because the honour of a seat is not eagerly contested. The peasants do not exactly correspond to our idea of that term: they consist of a body of little proprietors, or *lairds*, who cultivate their own ground, and who are numerous in Sweden. Their allowance of a dollar a day is provided by a subscription among their constituents; and, in some cases, two or three districts must combine to furnish out one deputy. The nobles have bestirred themselves much to keep down the attempts made by this class to rise in society. They have procured regulations, according to which no person could sit in the house who allowed himself to be called *Herr* (or Mr.), or who wore a coat of fine cloth. Notwithstanding all their efforts, however, this house, and that of the burghers, are daily increasing in strength.

3279. *In the division of powers*, the royal prerogative is ample. The king appoints to all offices civil and military, and he is obliged to convoke the diet only once in five years, and to continue its sittings three months; but he may make the meetings more frequent, and longer. He has also a negative upon the laws proposed by the diet. In regard to the diet itself, the division rests with a majority of the houses; but if they be two against two, the balance is struck by the committee of state, a body composed of a certain number of members from each. No tax can be levied, or loan obtained, without the consent of the diet.

3280. *The storthing of Norway*, restored by Bernadotte, is possessed of much higher privileges than the Swedish diet. It assembles more frequently, and at its own time, without any control from the king; and it allows to him only a suspensive *veto*, obliging him to accept any project which has been three times presented by the *storthing*. These rights having been once granted, Bernadotte, who found them pressing somewhat hard against his prerogative, has in vain made several attempts to abridge them. Mr. Lloyd, in his late Travels, informs us that a highly republican spirit prevails in Norway, and that the influence, and almost existence, of the nobles is nearly annihilated.

3281. *The revenue of Sweden* arises from a poll-tax of one shilling and threepence a head; of the produce of the royal demesnes, duties on exports and imports, mines and forges, distilled spirits, and in some monopolies. Dr. Thomson estimates the whole produce at 1,050,000*l.* a year, exclusive, however, of lands assigned to soldiers and sailors, and by which these classes, in time of peace, are chiefly supported. The *military force* is, at present, —

		Sweden.		Norway.		Total.
Infantry	-	26,221	-	9642	-	35,863
Cavalry	-	4580	-	1070	-	5650
Artillery	-	2400	-	1278	-	3678
Landwehr	-	83,368	-	10,000	-	93,368

The troops are raised by conscription: they only receive pay when on actual service; remaining, at other times, in the provinces, where they employ themselves in cultivating lands assigned to them for their support.

SECT. V. *Productive Industry.*

3282. *Sweden seems doomed by nature to be a poor country.* Her most southern districts are beyond the limits of the temperate zone, in which alone the finer and more valuable kinds of grain, and the richer fruits, come to maturity. Her scanty harvest consists solely of rye, bigg, and oats, scarcely accounted as food in more favoured climates. Scandinavia is described generally as one unbroken boundless forest, varied only in its aspect by little patches of cultivated land.

3283. *Agricultural industry* till of late had not done much to remedy natural deficiencies. According to the valuable statistical details collected by Dr. Thomson, the arable land in Sweden amounts to 1,818,450 English acres, which is only a sixty-second of the entire surface, or, throwing out the Norrland deserts, a thirty-second. Of this, 1,363,000 acres are returned as under cultivation. But the average size of a Swedish farm is only twenty-seven and a half; the annual average of grain sown on each farm does not amount to a Winchester bushel; and the annual produce of the whole country was only 5,700,000 spans, or about 71,000 quarters. Hence Sweden was obliged to import grain to a great extent; and such is the scarcity, that the peasantry often grind the bark or even wood of the fir tree into flour; a nutriment equally scanty and unwholesome. These statements are given in 1812; since which time we find it mentioned that agriculture has made a very rapid progress; that improved processes have been introduced from Britain and other countries; and that, in the most southern provinces, a great extent of moving (and before entirely barren) sand has been

rendered solid, and covered with plantations and grain. The consequence has been, that in 1827, Sweden even exported 39,000, and in 1828, 164,000 tons of grain of every description. Every farm has a tract of forest of about 1000 acres attached to it, on which cattle are fed: these are reported as only amounting to 403,000 horses, 1,475,000 cows, and 1,212,000 sheep. The most valuable product of land is formed by the vast forests with which nature has covered the whole country. The trees over all Scandinavia are small, and consist chiefly of the birch, the pine, the spruce and Scotch firs. Wooden inclosures (*fig. 430.*), of a peculiar form, are universally employed.

430

SWEDISH MODE OF INCLOSURE.

The poplar and the willow are also indigenous. The timber of these trees, as well as the tar, pitch, and turpentine, drawn from them, form the chief objects of Scandinavian exports. Those on the hills of Norway are in much demand for masts. According to M. Hegelstamm, not more than the 115th part of the surface of Norway is under cultivation, chiefly in oats; a space which might be greatly extended; yet the annual production is stated at 2,650,000 tons. The great variety of climate and surface in Norway produces a corresponding variety of vegetation, which, however, is chiefly an object of scientific curiosity.

3284. *The manufactures of Scandinavia* are inconsiderable, unless we should class their mines as such. Even in the common trades the work is

lazily and ill performed, and charged at a high rate, which renders this the most expensive country in Europe for those who live luxuriously. It is a curious fact that some great merchants in the western towns send their linen to be washed in London.

3285. *The mines of Sweden* are peculiarly rich in important products. Its iron, found chiefly in primitive rocks, is the finest in the world, and is widely diffused. In 1812, there were 176 mines; 624 smelting-houses; 764 forges; producing in all 1,293,411 cwt. of iron. The exportation, in 1821, amounted to 340,000 skippund, and in 1824 had risen to 373,000, of which 345,000 were in bars, and 28,000 in ruder forms. There are also some valuable mines in the southern provinces of Norway. A most extensive deposit of copper occurs in the province of Dalecarlia, particularly at Fahlun. Gold occurs at Adelfors, in Sweden, to no great amount; but the silver mines of Kongsberg, in Norway, are the richest in Europe. The metal occurs in masses, of which there was once found one weighing 600 lbs. There are also lead mines of some importance at Scola, and in other parts of Sweden.

3286. *Fishery* appears a pursuit peculiarly appropriate to the extensive coasts of Scandinavia. Yet the Swedes are not much addicted to it, probably because the Baltic during a great part of the year is frozen. Gottenburg had once a herring fishery, now nearly lost, the shoals having taken another direction. The Norwegian fishery is considerable, though bearing only a small proportion to the almost unlimited opportunities afforded by its wide seas, and its deep and commodious bays. Its chief theatre is far to the north, off the Isles of Loffoden. The season lasts only for seven or eight weeks in the year, when fishermen crowd thither from all quarters. Codfish is the chief object: it is cut in pieces, and spread on the rocks to dry, whence it receives the names of stockfish and clipfish. According to Mr. Brooke, the number taken in a year was 700,000, which may be worth 120,000*l.*; they are sent chiefly to Germany, Spain, and Italy. The roes are also salted and barrelled for exportation; also the fish oil to the amount of about 30,000 barrels.

3287. *The commerce of Scandinavia* is greater than its unimproved agriculture and total want of manufactures might lead us to suppose. But nature has gifted these bleak regions with an almost inexhaustible store of timber and iron, two of the prime necessities of human life; the main implements in ship-building and in the construction of houses, machinery, and furniture. These articles are indeed also the produce of North America; and Britain, which affords the best market, has lately sought to favour her colonies in that quarter by a great inequality of duties. Yet the superior quality of the Scandinavian commodity always secures it a sale. In 1829, Britain drew from Norway 17,000 loads of timber; 3582 small masts; 9809 deals and deal ends; 6360 battens and batten ends. The entire exports of Norway are estimated by Dr. Clarke at 1,800,000*l.* sterling; but we believe that this is very much beyond the mark. The commerce of Sweden is not on so great a scale; her surplus timber being not nearly so ample, though her iron is superior. She has suffered much injury from the absurd prejudices of the peasantry, who obtained the prohibition of colonial produce, and of almost all foreign articles of consumption; and though these were regularly imported, and in daily use, the trade was greatly fettered by being carried on only as contraband. In 1828, however, commercial treaties were concluded on a more liberal footing. In 1824, the shipping employed between Great Britain and Norway was 130,000 tons, of which nearly the whole was Norwegian, while that employed in the trade with Sweden was 28,000 tons, of which two-thirds were Swedish. Mr. Wilson thus states the annual imports from Sweden into Great Britain:—12,000 tons of iron, at 15*l.* per ton, 200,000*l.*; wood, tar, and other articles, 128,000*l.*; total amount, 328,000*l.* Of these, the value of 105,000*l.* is from Gottenburg; 158,000*l.* from Stockholm; 65,000*l.* from other ports. The exports to Sweden, consisting of indigo, sugar, coffee, cotton, spices, dye-stuffs, &c., amount to 500,000*l.*; of which at least 70,000*l.* is contraband. The total number of merchant vessels belonging to the different towns of Sweden, in 1829, was 1178, of the burthen of 61,000 tons; so that the greater number must have been what are called in England boats.

SECT. VI. *Civil and Social State.*

3288. *The population of Sweden*, according to the latest census, made in 1825, amounted to 2,771,252; of whom 20,499 were nobles; 13,977 ecclesiastics; 66,604 citizens; the remainder belonged to the class of peasants. Of these, 1,332,970 were males, and 1,438,282 females; 2,489,973 resided in the country, 281,279 in the cities. This was a rise of 357,021 since 1811, and 186,562 since 1820.

3289. *The population of Norway*, by a census made in November, 1826, amounted to 1,050,132; of whom 105,021 inhabited cities, 934,414 the country. This was a rise of 164,662 since 1815.

3290. *The national character of the Swedes* is usually painted under favourable colours. Their honesty is described as proverbial; and Dr. Clarke considers the contrast between them and the Russian people, in this respect, as most striking. Highway robbery, though it has been known, is exceedingly rare; and charity boxes, which are often set up on the public roads, have never been plundered. "The nation," says Mr. James, "has its singularities: there exists something of a reciprocity between the moral and political constitution of Sweden. Rigidly ceremonious, they make their stiff and measured courtesies the essentials rather than the forms of life; and seem, in a stranger's eye, a people cold in their nature as the very snows they dwell upon. Their characteristics, a passive courage, not unmixed with indolence; a pride not free from ignorance; a disposition that is not ill-humoured, from having

no humour at all, from indifference, from apathy. But a Swede is never in extremes; even these traits are not deeply marked; and if we review the more favourable side of his character, we shall find in him an undaunted spirit of perseverance, and an honest love of freedom, to which the feelings of every one do homage." The same writer mentions a cold-blooded obduracy, connected, perhaps, with a sanguinary turn of mind, displayed in those frequent assassinations which have stained the pages of Swedish history. The manners of the higher ranks, in consequence, perhaps, of political connection, have been studiously formed on the French model, which does not accord very happily with the somewhat rude simplicity of the Swedes, who find it easier to imitate the frivolity and dissipation of that people, than their easy and careless grace. Several habits are enumerated as prevalent even among the higher classes in Scandinavia, which seem to negative its pretensions to any high pitch of refinement. Among these are, spitting even on handsome carpets, blowing the nose with the fingers, and recording games on the table with chalk.

3291. *The religion of Sweden* is Lutheran, and the church episcopal. This country, which stood long at the head of the great protestant confederacy, is animated with an ardent zeal for the reformed religion. The Catholics, till of late, scarcely enjoyed common toleration, and they are still excluded from the diet and the higher offices of state. The Swedish people are commended for their regularity in performing the duties of their religion: at the same time it has been remarked that the dissenters from the established church are much fewer than in other protestant countries; which has been imputed to the want of any peculiar fervour upon the subject. The wide extent and thin population of the northern districts must often render the provision for their religious instruction very defective. The diocese of Tornea, in Lapland, is 750 miles in circumference; and, what is more blameable, the small number of clergy employed are not required to understand the language of the natives. The income of the largest bishopric in Sweden is only 1000*l.* a year.

3292. *In science*, the Swedes, considering their poverty and remote situation, have made a very distinguished figure. Gustavus Adolphus favoured the interests of literature with a degree of ardour not generally known. Of the spoils of places conquered by him, he set a particular value upon books, which he transmitted to Sweden, in order to form the foundation of several large libraries. Christina displayed an ardent, though somewhat fantastic and capricious taste for letters. After an interval of some reigns devoted to war, Adolphus Frederick, and particularly his queen, Ulrica Eleonora, undertook the patronage of science with a zeal which was seconded by their successor, Gustavus III. The Swedes cultivated with peculiar ardour botany and mineralogy, which some of their countrymen mainly contributed to raise to the rank of sciences. In botany, the name of Linnæus is yet without a rival; and Cronstadt and Bergman were in their day little inferior, though they now yield to Werner and other great names which have arisen in other countries. Bergman and Scheele made also large contributions to chemistry, which is still ably pursued by Ekeberg, Berzelius, and Afzelius. Although history and poetry have been cultivated, they have not produced any writers whose reputation has spread throughout Europe. From the limited sphere of the Swedish language, few works of science are written in it, or translated into it: hence the literati of Sweden are particularly well versed in the languages of foreign nations. One of the subjects in which Sweden may most justly exult is, the general spread of education among the lower orders, which seems to equal or exceed that which Scotland enjoys; and to this may probably be in a great measure ascribed their generally meritorious conduct. Norway is not nearly so literary a country as Sweden; Dr. Clarke even states that there is not in the whole country a single bookseller's shop. This was in a great measure owing to the mean jealousy of Denmark, which would not allow an university to be founded even in Christiania, which used to be a rival to that of Copenhagen. Yet Norway can boast of literary names; Holberg, Pontoppidan, Vahl the botanist, Torfæus, and Snorro Sturleson, the old historians. A vein of bold and rude poetry is cultivated with peculiar ardour; and Dr. Clarke exhibits a roll of names unknown to Europe, whose claims to distinction appear to be somewhat justified by a specimen given to us by Mr. Wilson.

3293. *Of the learned establishments of Sweden*, the most eminent is the university of Upsal, the chief nurse of all the great men who have distinguished her literary records. This celebrated seat of northern learning was founded in 1478, by Steno Sture, was enlarged by Gustavus Vasa and Gustavus Adolphus, but reached its highest eminence in the last century, when it was adorned by Linnæus, and all the men of science who have been distinguished as reflecting glory on Sweden. Since that time its lustre has been somewhat diminished, though statements on this subject vary considerably. These institutions bear no resemblance to the stately establishments of Oxford and Cambridge. The professors have salaries of 100*l.* a year; and are left thus almost wholly dependent on their students, who live in private lodgings, are subject to no discipline, and dine usually at what Dr. Thomson calls ordinaries, but Dr. Clarke tap-houses. They attend what and whom they please; and their exertions are not stimulated or tried by any public examinations. Dr. Clarke has drawn a most unfavourable picture of the Upsal student, whom he represents as slovenly, careless of study, and addicted to intoxication; but Mr. Wilson considers this cen-

sure as much too indiscriminate. The mineralogical collection is one of the most complete in Europe; and the library, founded by Gustavus Adolphus, and enriched by successive monarchs, contains 50,000 volumes. Its most precious treasure is the Codex Argenteus, a manuscript of the four Gospels, written in silver characters, and supposed to date as far back as the fourth century. The garden of Linnæus has been neglected for a larger one lately founded, but which scarcely corresponds to the botanical fame of Upsal. The royal library at Stockholm is still more extensive. It had been founded also by Gustavus Adolphus, but was chiefly indebted to Gustavus III., who presented to it his own valuable private collection. It is particularly rich in manuscripts, in sagas, and other historical works, and in original drawings by the great masters. This collection is open to the public. The Swedish academy of sciences, founded in 1739, by learned private individuals, has published above 100 volumes. It is considered one of the most distinguished in Europe, and the greatest men in other countries have viewed it as an honour to be enrolled among its members. In the college of mines are preserved copious specimens, drawn from a country so rich in metallic productions. The cabinet of models, presenting the various mechanical contrivances employed through the different parts of Sweden, is also considered very interesting.

3294. *The fine arts in Sweden* have been cultivated amidst considerable difficulties. The opera is conducted with splendour, and even taste; but, as Sweden cannot pay for performers of the first class, Italian airs are not sung with full effect, and the old national music is neglected. Greater success has attended the efforts to promote the arts of design. Lergell, as a sculptor, has been ranked second to Canova, and even called the Michael Angelo of the North. Breda in portrait, and Fulerantz in landscape, enjoy reputation; though the latter paints a nature very different from ours. Architecture is too costly an art to have arrived at much perfection in Sweden.

3295. *The habitations of Scandinavia* are very simple and uniform. "Having," says Dr. Clarke, "once figured to the imagination a number of low red houses, of a single story, and each covered with turf and weeds, a picture is presented of the oppidan scenery of Sweden." The houses, however, are well finished within, and elegantly furnished; and by means of stoves, double windows, and close doors, they are kept comfortably warm, even during the most rigorous winter. Swedes have even complained that they suffered much more from cold in London than in their native city.

3296. *The dress* is described by Dr. Clarke as equally uniform with the habitations. "A skull-cap, fitting close to the crown, edged with a little stiff lace, the hair being drawn as tight and straight as possible beneath the cap from all parts of the head, as if to start from the roots; add to this, a handkerchief thrown over the

cap when they go out; a jacket; short petticoat; stockings of coloured or white woollen; and high-heeled shoes;" this is the general costume of the Swedish women. Mr. Wilson thus describes the dress of the representatives of the class of peasants:—"White worsted stockings, half boots extending above the calf of the leg, yellow leather small-clothes with knee-buckles, a short brown coat and waistcoat, and a plain handkerchief tied round their necks." The annexed cut (fig. 431.) may give an idea of the attire and aspect of the Norwegian peasantry. In winter these garments must be reinforced to the utmost ability of the wearer, as a fence against the excess of the cold. The peasantry wear a sheepskin cloak, with the wool towards the body, and close fur caps. Dr. Clarke mentions as a travelling dress, thick yarn stockings covered by stout leather boots, and over these again boots made of the hides of rein-deer, with the hair on the outside, and doubly lined with sheepskin covered with black wool. The people wear, besides, fur caps on the head, bearskin pelisses over the body, besides several flannel waistcoats, and on the hands, gloves of sheepskin covered by double gloves of fur and wool. Yet these accumulated guards are insufficient to prevent the feeling of the most intense cold, which, in those not duly fenced against it, sometimes produces death, and frequently a frost-bitten limb.

431

NORWEGIAN PEASANTS.

3297. *Food* is an article which, though scanty among the peasantry, is most abundantly consumed among the opulent classes. Indeed, eating is an affair of greater importance in Scandinavia than perhaps in any other part of the world. The heroes and even the gods of their ancestors are celebrated in song for the quantity of victuals consumed by them. Every Scandinavian dinner begins with a whet, administered in a separate apartment, and which consists of cheese, salt fish, salmagundi, and other dainties which seem rather adapted to satiate than excite appetite. The company then repair to the dining-room, where an almost endless succession of dishes is handed round, one after the other; nor does politeness allow any one to be called for, till the preceding dish has gone its round. This "never ending, still beginning feast," as Mrs. Woolstonecraft calls it, lasts usually two or three hours, when coffee is introduced, and the company break up. Nothing is considered so ill bred as not to eat enormously; so that Dr. Clarke considers two days' previous fasting as almost necessary to be an acceptable guest at a Swedish dinner.

SECT. VII. Local Geography.

3298. *This section* naturally divides itself into three subordinate parts:—1. *Sweden*; 2. *Norway*; and 3. *Lapland*, which, though accounted partly Swedish and partly Norwegian, has a distinct character of its own.

SUBSECT. I. Sweden.

3299. *Sweden* is formed into three great divisions: Svealand, or Sweden Proper; Gotland, or Gothland; and Nordland or Norrland. In the following statistical table, the extent and

arable produce are from materials collected in 1812, since which time cultivation has been greatly extended; but the population is from the census of 1825.

	Swedish Square Miles = 44·4 English.	Arable Ground, Tunnlands (1½ acre).	Being to the whole as 1 to	Number of Farms.	Operative Farmers.	Grain produced in Spanns (1·20th bushel).	Population.

3300. *Sweden Proper* occupies the centre of the kingdom, and includes the capital, and the great mining districts. It consists of an immense plain, covered by almost boundless forests, intermixed with patches of cultivation; only a few hills of moderate height breaking its vast uniformity. Three great lakes, like inland seas, the Wener, the Wetter, and the Malar, form almost a continuous chain across its centre. Besides these, there is an immense number of smaller lakes, especially towards the north, communicating by river channels with the greater. These lakes, not being bordered by mountain banks, do not display the grandeur which belongs to those of Switzerland, or even of England. But their wide and winding shores, broken with rocks, and fringed with a profusion of wood, present many romantic and almost fairy scenes.

3301. *The division into provinces, of Sweden Proper*, as well as of Gothland, as given in the above table, was made recently by government, and is the only one upon which statistical details have been collected. But there is another and earlier division, which remains still fixed in the Swedish mind; and corresponds, in fact, both to the aspect of nature and to the peculiarities in the people. These are Sudermanland, the province which contains the capital, and is situated on the south side of the lake Malar; Upland, a high territory on the northern side of that lake; Westmanland, to the west of Upland; Nerike, a beautiful little region, completely enclosed between the three great lakes; Warmeland, to the north of the Wener, covered with a multitude of little lakes; and lastly, Dalecarlia, called also Dalarne, or the Plains, a province which, of all others, presents the most striking and peculiar features. It is, above all, distinguished by the energetic character of its peasantry, whose exertions at one time reared the fallen monarchy, and who continue to form its most powerful defence. They still hold as a maxim, that one Dalecarlian is equal to two of any other Swedes. Their diet is poor in the extreme, consisting in a great measure of bark-bread: yet their health and vigour does not suffer; and a number of them, who were quartered as troops at Stockholm, were affected with fevers in consequence of the repletion caused by eating wheaten bread. The memory of the great Gustavus Vasa, the founder of the Swedish monarchy, is cherished in this province with the utmost warmth; and many memorials of him are preserved in different places.

3302. *Stockholm* (fig. 432.), with which we shall commence our details, is finely situated,

STOCKHOLM.

at the junction of the extensive and beautiful lake of Malar, or Mälar, with the sea. It stands partly on some small islands, and two peninsulas, presenting a view as beautiful and diversified as imagination can conceive. Innumerable craggy rocks rise from the water, partly

covered with houses, and partly planted with wood; while vessels of all forms and descriptions are seen passing to and fro. "From one point of view," Dr. Clarke observes, "it seems a Cyclopean heap of the most noble structures; palaces and churches all piled one above another, and the whole floating, as it were, upon the broad bosom of the deep. White edifices, consisting of public and private palaces, churches, and other buildings, rising from an expanse of waters, produce an effect of incomparable grandeur. When the lake and sea are frozen, they are covered with sledges of all kinds, and exhibit one of the gayest scenes imaginable. If external appearance were alone to be relied on, Stockholm might be deemed the most magnificent city in the world. This impression is not sustained by any beauty or convenience in the interior. Except the great square of Norden Malm, the streets, though of very considerable length, are neither broad nor handsome. There is no foot pavement; the houses are lofty, all whitewashed, and the shops are extremely poor. The different families reside in separate floors or stories, one above another, the ground-floors being usually occupied as shops. The royal palace, however, begun by Charles XI., and finished by Gustavus III., may vie with any structure of the kind in Europe. It is in the Grecian style, quadrangular, four stories high, built of brick only, but faced with stone-coloured cement. Its situation, facing the quay, and commanding a view of all parts of the city, adds greatly to its beauty. It contains some fine specimens of sculpture and painting, curiosities connected with Swedish history, and a range of small apartments embellished by Gustavus III. in a fanciful manner. This palace, with the finest buildings of the city, stands on one of the islands. The kings of Sweden have in the country other palaces: that of Drottningholm is a handsome stuccoed building, roofed with copper, and having side wings; but the gardens are barbarously laid out in the old fashion, with trees and hedges clipped into fanciful shapes.

3303. *Nyköping* is the only tract of Sweden Proper which is south of the lakes. The town of that name, though small, has an air of magnificence. The houses are of wood painted yellow.

3304. *The provinces of Wester Orebro, and Carlstadt*, along the north side of the lakes, reach across the kingdom. Enköping, on a branch of the Malar, is the first town which occurs westward from Stockholm, but it is not of great consequence. Westeras, on the same lake, has more commercial importance, as a link between the capital and the northern and western provinces. There is only one principal street, about two miles in length; the houses are only of one story, and often roofed with turf. It is the see of the richest bishopric in Sweden. The cathedral is a simple edifice; but one of the most elegant in Sweden, adorned with a very elegant porphyry monument erected to Eric IV., who died by poison in 1577. Next comes Köping, small and poor; but celebrated as having been the residence of Scheele. It lies at the extreme interior point of the Malar. Quitting that lake, and proceeding south-west, we come to Arboga, a beautiful little town on a river which falls into that lake, and near a canal which connects it with the lake Hjelmars. A steam-packet, established by an Englishman, now enables it to communicate with the capital. Nearly due west is Orebro, a more considerable town, and the occasional place of meeting for the Swedish diet. It is reckoned the fifth town in Sweden, containing about 4000 people, and the streets are broad and spacious, though the houses, as elsewhere in Sweden, are low, and of painted wood. The stadthaus, or governor's residence, which includes also the prison, is a huge shapeless edifice. The church, which forms also the place of meeting for the diet, is an ancient structure, originally Gothic, and built of stone, but patched with brick, and in various styles. Proceeding westward, we enter Carlstadt, or, as anciently called, Warmeland, a region entirely of mines, forests, and lakelets, and bounded on the south by the extended shores of the Wener lake. Carlstadt is situated near the point where this lake receives the Clara, a considerable river, which traverses these wooded regions, and down which immense quantities of timber are floated; advantage for this purpose being taken of the floods to which it is occasionally subject. One company from Gottenburg has saw-mills, at which are annually cut upwards of 50,000 planks. Carlstadt is a place of from 2000 to 3000 people, presenting the ordinary aspect of Swedish towns. It collects the vast produce of the mines and forests of Warmeland, and transmits them across the Wener to

PERNBERG MINZ.

433

Wenersberg, whence they find their way to Gottenburg. Considerably in the interior is Philipstadt, in the very heart of the iron mines, by which it is supported.

3305. *The most remarkable are those of Persberg (fig. 433.)*, a few miles to the eastward. They are thirteen in number, dug into a mountain entirely composed of veins and beds of iron ore. Dr. Clarke, after having, in the course of ten years' travel, inspected many of the principal works of this kind in different countries, declares, that he had never beheld anything equal to this for grandeur of effect, and for the tremendously striking circumstances under which human labour is here performed. In the wide and open abyss suddenly appeared a vast prospect of yawning caverns and prodigious machinery. Immense buckets, suspended by rattling chains, were passing up and down; ladders were scaling all the inward precipices; upon which the work-people, reduced by their distance to pigmies, were ascending and descending. The clanking of chains, the groaning of the pumps, the hallooing of the miners, the creaking of the blocks and wheels, the trampling of horses, the beating of the hammers, and the loud and frequent subterranean thunder from the blasting of the rocks by gunpowder, in the midst of all this scene of excavation and vapour, produced an effect that no stranger could witness unmoved. The miners work in spacious caverns, amid falling waters, tumbling rocks, steam, ice, and gunpowder. They receive two shillings a day; good pay in Sweden.

3306. *Dalecarlia*, or *Dalarne*, extends to the north-east of *Warmeland*. It is covered with an extraordinary profusion of mosses and fungi, so that it is termed by Dr. Clarke the supreme court of the cryptogamia. We have already remarked the peculiar character of the people, who preserve entire the dress, habits, and the daring energy of the ancient Swedes. The most important branch of productive industry consists in the mines, particularly the great copper mine at *Fahlun* (fig. 434). It is immediately adjoining

FAHLUN MINE.

to the town, and consists of an enormous conical mass with the top downwards. The bottom of the cone being the top of the mine was the first worked; and the galleries being made through it without due precaution, the whole fell in, producing an immense open crater which still remains. Regular staircases of easy descent traverse this immense crater or basin, from its outer lip to the lowermost point, whence arise vast volumes of smoke and vapour, giving it the appearance, on a greater scale, of the Neapolitan Solfatara. It is divided into no less than 1200 shares or sections, among which the ore is divided immediately on being brought up, and it is then smelted on a small scale by the different individuals. The ore is not rich. In 1600, this mine is said to have yielded 8,000,000 pounds of copper; in 1650, 5,500,000; but at present only 1,120,000 pounds. The workmen have now reached the bottom, or the surface of the cone, and are still working through the ground, in the fond hope of coming to the top of another cone, reaching downwards. Unless this chimera should be realised, the mine, it is said, will, in a few years, cease to be productive. *Fahlun* is a regularly built but old-fashioned and dirty town, subsisting solely by the mine. It has two churches, one covered with copper, but

this has not a handsome appearance, the colour of that metal being converted into a whitish green soon after exposure to the weather. Near *Fahlun* is the house where *Gastavus Vasa* lay concealed, the proprietor of which has studied to preserve in its pristine state this asylum of the Swedish king. His chamber, bed, and clothes are still shown; his shirt of worsted mail fitted similar to those made by the Circassians, and his other weapons.

3307. *Sala*, which is properly in *Westmanland*, may be mentioned here as another mining town on a smaller scale, neat, regular, but ill-paved. The only important mine is one of galena, which yields 2000 marks of silver, and 32,000 pounds' weight of lead. There is also a copper mine, which produces little; and one of iron, which is not considered worth the expense of working.

3308. *Upland*, coinciding nearly with the modern *Upsala*, is an interesting province, extending from a part of the lake to the river *Dal*. It is flat, but diversified with numerous little round knolls, which, with the small lakes and the numerous fine forests, render it picturesque. It contains *Upsala*, the seat of the great northern university, and *Danemora*, the most valuable of the iron mines.

3309. *Upsala*, or *Upsal* (fig. 435.), is the place in Sweden most venerable for its antiquity.

UPSALA.

It was long the residence of the kings, and has always been the chief seat of religion and learning. Even in pagan times it was the residence of the high-priest of *Odin*; and in 1026, *Everinus*, a bishop from *England*, was placed there, for the purpose of converting the natives to Christianity. The cathedral is the largest and finest ecclesiastical monument in Sweden, a country not eminent for such structures. The exterior is indeed only of brick, and there is an injudicious

mixture of the Gothic with the Doric towers. But the interior is very striking, adorned with a double row of fourteen fluted columns, a magnificent altar, and above all by many monuments of the kings and heroes of Sweden. Particular notice is attracted by that of *Gustavus Vasa*, and the three *Stures*, successively regents of the kingdom, who, in that station, earned the title of fathers of their country. The shirt of mail of *Margaret*, the *Semiramis* of the North, is also kept as a warlike relic. *Upsala* contains also a palace founded by *Gustavus Vasa*, now half burnt down. It is at present supported solely by the university, of which an account has already been given. It is destitute of all trade or industry. It is therefore small, but very regular and neat, having a large square in the centre, where all the streets converge.

3310. The mine of *Danemora* is situated near the small town of *Osterby*. Swedish iron is the best in the world, and the iron of *Danemora* is the best in Sweden. Dr. Thomson was told at *Sheffield*, that cast steel could not be made with any other. *Danemora* was first wrought as a silver mine, but this was soon exhausted. The iron then began to be

wrought, and soon established the high character it now holds. The great opening is fifty fathoms deep, and the mine has been wrought thirty fathoms lower down. The ore is blasted with gunpowder. At short intervals are heard tremendous explosions, like the discharge of the heaviest artillery, which are echoed through the caverns, and shake the earth like a volcano, while volumes of smoke burst forth after each crash. From the mouth of the cavern enormous masses of iron are raised up by machinery. The mine belongs to a number of private individuals, who have erected a steam-engine at an expense of 36,000 rix-dollars. The produce is estimated at 4000 tons. There are twenty-seven other mines in the province of Upsala.

3311. *Gothland, or Gotaland*, the southern division of the kingdom, forms a large peninsula, with a wide circuit of shores. It enjoys a considerably milder climate, and is the only part of the kingdom where wheat is raised in any considerable quantity. It is here also that the recent improvements in agriculture have been chiefly observable. There is thus more land in cultivation, and trees will not grow in the immediate vicinity of the coasts; so that Gothland is not so thoroughly covered with wood, as the provinces to the north of the lakes. If we except the capital, this division contains almost all the sea-ports and naval arsenals; and consequently engrosses nearly all the foreign commerce of the kingdom.

3312. *The modern and official divisions of Gothland* have been exhibited in the statistical table. The ancient divisions are into Eastern and Western Gothland, divided from each other by the long line of the lake Wetter; Smaland, an extensive but barren tract, to the south of that lake; and Scania, or Schöonen, the southern peninsular extremity of Sweden, a better peopled, and better cultivated district than any other in the kingdom.

3313. *Eastern Gothland* comprises chiefly the modern provinces of Nyköping and Linköping. The town of Nyköping is agreeably situated at the extremity of a small bay of the Baltic, and though small has an air of magnificence; but it carries on little or no trade. It is now much outstripped by Noorköping, the largest of all the *köpings*, and the fourth town in Sweden. Noorköping lies upon the large river Motala, which communicates between the lake Wetter and the Baltic, and which is here broken into numerous rocky channels. The chief branch of industry consists in the manufacture of broad-cloth, which is produced so fine as to sell at twenty-seven shillings per ell, of one yard and three quarters broad. The breed of sheep in the neighbourhood has been considerably improved by the introduction of merinos. The town is regularly built, of neat wooden houses. (The term *köping*, it may be observed, signifies market, being synonymous with the Anglo-Saxon terms *cheap* and *chipping*.) Linköping is another provincial capital, handsomer in its aspect, though much smaller, than Noorköping. The cathedral, rebuilt four hundred years ago, is one of the finest ecclesiastical structures in the kingdom, and near it is a very handsome theatre.

3314. *The district of Smaland* has for its chief town Jonköping, situated at the extremity of the Wetter, and commanding grand and beautiful views over that immense lake, which has here a wide border of low but finely wooded rocks. The town has been entirely rebuilt since 1790, when it was burnt to the ground. Though built chiefly of wood, like other Swedish towns, it contains many good and commodious houses, the residence of wealthy inhabitants, who have been attracted by the amenity of the site. A high court of appeal for this part of Sweden is established here. About ten miles distant is Tuberg, a long round-backed hill, composed wholly of one unbroken mass of fine magnetic ironstone. It presents such a colossal mass as in Hausmann's opinion must continue to afford a source of riches to the remotest posterity. The upper bed, 370 feet thick, has been wrought for 250 years. It is merely blasted with gunpowder, when the fragments fall to the bottom, and are conveyed to neighbouring furnaces. The ore is not very rich, the proportion of pure iron varying from 21 to 32 per cent.; but it is very tractable, and free from any hurtful ingredients. The hill, though only 400 feet high, commands an almost boundless view over the vast wooded flats of Smaland. This district contains also a considerable quantity of bog iron ore of inferior quality, and some copper mines. A celebrated but not valuable product is the gold mine of Adelfors. The working of it began in 1738, and was continued for half a century, with some advantage, when it ceased, as Dr. Thomson was informed; but Mr. James learned that in the year preceding his visit it had yielded the small amount of sixty or seventy ducats.

3315. *The sea-coast of Smaland*, consisting of the modern provinces of Calmar and Bleking, is of a naked and unpromising aspect, but contains some havens of importance. Calmar is noted in Swedish history as a strong fortress, and still more because in one of the apartments of its castle was signed the celebrated treaty which united the three crowns of the north on the head of Margaret. Carlsrona is the chief naval arsenal and one of the largest towns in Sweden. It is built on three small islands connected with each other and with the coast by long wooden bridges, while other islands serve for the erection of works for the defence of the harbour. These are square batteries of stone, well mounted with ordnance, which appear formidable enough, though probably not capable of coping with a ship of the line. Separate establishments exist for the large vessels, and for the flotilla; but one of the most remarkable features consists of the covered docks, partly excavated out of the vast masses of solid rock. The want of tides in the Baltic is supplied by sluices, which open into the port, and are emptied again at pleasure. Carlshamn is a smaller town, romantically situated, like a cluster of nests, on the tops of cliffs. During war it enjoyed a considerable proportion of the neutral trade, which it has since lost. Christianstadt is a fortress of considerable celebrity, the capture of which formed the first military achievement of Gustavus Adolphus. Some fragments of the fortifications remain, and the approach to them is defended by an extensive swamp which surrounds the place.

3316. *Scania* begins here, a flat and fertile peninsula, forming the most southern part of Sweden. It contains also, at Hogenaas, considerable coal mines of good quality; but when Dr. Thomson was in Sweden, their produce was sold at a higher rate than coal imported from Newcastle, and consequently found no sale in Sweden, where, moreover, wood is preferred. They were only sent into Denmark, then shut against the British trade. There are numerous German residents in Scania, supposed to have sought refuge there during the protestant persecution in Germany; and some Scotch farmers have also sought to introduce an improved system of agriculture. In the centre of Scania is Lund, the seat of the second university in Sweden, containing 30,000 volumes, a good observatory and botanical garden, and a noble cathedral in the Norman style of architecture. Its professors are zealous Lutherans, but they have not raised it to the same celebrity as Upsal. Malmo, formerly one of the Hanseatic towns, is the chief seat of trade. Helsing and Ystadt, neat little ports, are the chief places of embarkation for Denmark and Germany. All these towns command magnificent views of the Sound, enlivened by the crowds of shipping that are continually passing.

3317. *Having turned the southern point of Sweden*, we come to the coast of West Gothland, situated on that great gulf of the German Ocean called the Cattegat. Being the part of the kingdom nearest to the great states of Europe, it carries on a principal part of the commerce of Sweden. Laholm and Halmstadt are ports of some consideration, in the gloomy and heathy province of Halland, but almost the whole of the western commerce of Sweden centres at Gottenburg.

3318. *Gottenburg* is built in the interior of a bay set round with rugged and naked rocks, and the whole country round is sterile and desolate. It is supported by its situation at the mouth of the Gotha, the broadest and most navigable of the rivers of Sweden, which by means of the canal of Trölhätta affords a full communication with the great interior lake of Wener, and the opportunity of bringing down those immense stores of wood and iron produced around its shores. The prosperity of Gottenburg was also greatly promoted by the French anti-commercial system, under which this port remained one of the few channels by which British goods could force their way into the Continent. It is a very handsome city, built entirely of stone, the use of

wood having been prohibited since the last great conflagration, the second which had occurred in the course of ten years. A magnificent church, lately built, is constructed, in a great measure, of stone imported from Scotland. The principal street, which is long and wide, has a canal running through it; the others strike off from it at right angles. The principal merchants are Scotch, and live in a style of great magnificence.

3319. *West Gothland* presents still some other striking features. Among these rank foremost the cataracts and canal of Trölvätta. Above the former the river is a mile broad; but being confined between two lofty rocks, it pours down its waters with prodigious force. The descent, however, is only a hundred feet in the course of two miles, making thus a rapid rather than a fall; the water rushing along with inconceivable rapidity, boiling up, and covered with foam. The noise is prodigious, and clouds of vapour are thrown up. These cataracts opposed a complete obstruction to the navigation of the Gotha, which the kings of Sweden made incredible efforts, and expended immense sums, in endeavouring to overcome; but their works were too imperfect to resist the impetuosity of the current. At length, in 1793, the enterprise was taken up by a company of private merchants, who in seven years brought it to a happy completion. The canal is twenty-four feet wide, and eight feet deep. It extends only two miles; but being cut through a granite rock, sometimes to the depth of one hundred and fifty feet, it proved a work of very great labour. It now yields, however, a revenue of 12 per cent. on the original expenditure of 358,000 dollars. Wenersberg, at the junction of the Gotha with the Wener, is the channel by which the products of the interior are brought down the river; yet it does not derive from this trade much prosperity or importance. Uddervalla and Stronstadt are small sea-ports, with some trade and fishery, but they have suffered since the herrings deserted the coast. Skara and Fahlköping are places of some consequence, in the interior of West Gothland.

3320. *Norrland* forms a third division, which, if considered as including Lapland (and it is so considered politically), would be much more extensive than all the rest of the kingdom put together. It is, however, our intention to reserve for a particular section the vast and peculiar region known under the name of Lapland. *Norrland*, in a restricted sense, comprises the four provinces named in the table, but is better known under the divisions of Jamtland, Angermanland, Medelpad, and Helsingland. Jamtland, where it borders on Norway, includes some of the highest mountains, several of them rising to 6000 or 7000 feet. The rest of *Norrland* is flat, and the climate moist and variable, like that of Jamtland, but colder. Wheat scarcely ripens beyond Sundswall; near to the southern border, barley and rye ripen with difficulty. Almost the only fruits are cherries and gooseberries. The land under cultivation did not, in 1812, exceed 52,000 acres, which is, in proportion to the whole, only as 1 to 915. Yet the people are industrious; and Von Buch observed a greater air of prosperity here than in the rest of the kingdom. The woods, which cover almost the whole country, are infested by numerous herds of wolves. Of the entire population, amounting to 159,100, only 6318 live in the towns, which, of course, must be very unimportant. Sundswall and Hernösand are, however, sea-ports of some little consequence, as is Umea; but this last properly belongs to Lapland.

SUBJECT. 2. *Norway.*

3321. *This extensive portion of the Swedish monarchy*, recently, by compulsion, but in all likelihood permanently, united, comprises a very long line of maritime territory, facing the boundless expanse of the Northern Ocean. Throughout its whole length, in an oblique line parallel to the sea, runs the chain of the Dofrines, presenting many bold and lofty summits covered with perpetual snow. Sneehatta, the highest, is 8100 feet. These mountains throw out numerous chains, sloping downwards to the sea, which form romantic valleys and deep and winding bays. Norway produces some corn, not nearly sufficient, however, for its own consumption; but exports large quantities of timber and fish; receiving, in return, those commodities of which it stands most in need.

3322. *The southern Norwegian provinces* of Aggerhuus, Christiania, and Christiansund, include a considerably greater proportion of level territory than the others. They have the great range of mountains to the north and west, and are not separated from Sweden by these natural barriers. Through these provinces flow southwards into the bay of Christiania the Drammen and the Glommen, the two greatest rivers of the North, and bring with them an immense quantity of timber, which is cut into deals, and exported to all parts of Europe. The export of iron is also considerable.

3323. *Christiania* (fig. 436.), capital of all this district, with a population of 20,581, now

CHRISTIANIA

ranks as the capital of the whole kingdom. It is situated at the head of a long interior bay or fiord, and in a situation which Von Buch considers as altogether wonderful. The bay, its islands, the crowds of sails spread among them, with the view of majestic hills rising over hills in the distance, appeared to him equalled only on the lake of Geneva, which, however, has not the vessels and islands. Christiania is chiefly

supported by the trade in deals; and those cut in its saw-mills are considered, by connoisseurs in this article, to be superior to all others. Some of its merchants, particularly the Ankers, maintain the state of princes, and are considered equal in wealth and liberal views to any in Europe. Christiania comes more into contact than Bergen with the more advanced countries of Europe, and has adopted almost exclusively the improvements which distinguish them. Dr. Clarke, indeed, complains that too much of an artificial polish has been substituted for the old frank Norwegian hospitality. Von Buch, however, conceives that intercourse with Christiania has materially benefited the inhabitants of the upland valleys. Sometimes, indeed, from those most remote, farmers come down in

long-bottomed coats, with indented flaps over the pockets, monuments of what their ancestors were in the days of Harold Harfager or Snorro Sturleson; while at the view of their wives, the citizen imagines himself standing before one of his old northern grandmothers. Only a faint ray of intellect, however, beams from these antique features, and they are considered as decidedly inferior to the cultivated inhabitants of the towns. The buildings are regular, and mostly of stone; so that in the course of 200 years, while other Scandinavian towns have been repeatedly reduced to ashes, Christiania has suffered only slight injury from fire. Since the union with Sweden, it has received an university, with two professors, who have moderate incomes, chiefly derived from grain.

3324. *There are other havens of some importance in this southern tract of Norway.* On the western coast of Christiania fiord, the two, Bragenæs and Stromsøe, unite in forming what is called Drammen, at the mouth of the important river of that name. Tonsberg, at the bottom of the same side, is a town of some ancient celebrity, but now a good deal decayed. On the eastern side of the same bay is Moss, watered by a stream, turning twenty saw-mills, by which an immense quantity of deals are prepared for exportation. Fredericks-hall, an ancient and still important frontier town, is beautifully situated in an interior bay, winding among mountains. Near it is the strong fortress of Frederickstadt, the scene of the death of Charles XII. The

SWINSUND FERRY.

pass of the Swinsund (*fig. 437.*), on the immediate frontier, presents one of the most romantic and picturesque scenes in Scandinavia. Christiansund, the most southern province of Norway, has a capital of the same name, the fourth town in the kingdom, which, from its situation on the Skagerrack, is visited for shelter and supplies by numerous vessels entering and leaving the Baltic. The interior from Christiania, though it includes Hedemarken and other large pastoral valleys, and though its communications are facilitated by the large lake of Miosen, does not contain a single town. That of Hammer attests its former magnificence, by the remains of a palace, and of several churches, now restored. The whole of this territory is hemmed in on the east and north by the gigantic ranges of the Doverfield and Fillefield, which separate it from Drontheim and Bergen.

3325. *The province of Bergen is rude, rocky, and mountainous, consisting of the slope downwards to the sea of the highest part of the Dofrine range.* The town of Bergen (*fig. 438.*), at the head of a long interior bay, is the largest in Norway, was formerly

BERGEN.

accounted the capital, and contains a population of 18,511. Its commerce, which is considerable, is founded on the exportation, less of the produce of the country behind it, than of the northern fishery at Loffoden, of which the produce is brought to Bergen by numerous barks. Its merchants had long the monopoly of this, and still retain much the greatest share. They are chiefly Dutch, and send a vessel

weekly to Amsterdam for a supply of the garden stuffs which their own soil does not yield. Bergen is built of large masses of wooden houses, amid rocks, and has suffered severely by fire.

3326. *The province of Drontheim, to the north of Bergen and Christiania, and separated from them by vast mountains, corresponds in latitude with the Swedish Jamtland.* The capital (*fig. 439.*), of the same name, is

DRONTHEIM.

situated on the shore of a winding fiord, but subsists less by foreign commerce than by the internal communication between numerous valleys and districts to which it forms a central point of union. Of these valleys, that of the Guldal is the most extensive and beautiful, and singularly celebrated in Swedish story and tradition. Here, it is boasted, dwelt the mighty Haco, the noble and wise Olaf Tryggvason. The society of Drontheim is always held forth as representing under its happiest light the genuine Norwegian character; its

warmth of kindness, and generous hospitality. Dr. Clarke praises chiefly its truly Norwegian simplicity; but Von Buch considers it as marked by more refined taste, more graceful and attractive manners, than the society of Christiania. In no district of Norway is there said to be such a feeling of patriotism and public spirit. Drontheim is built wholly of wood, and has in consequence been seven times burnt to the ground; yet the houses are handsome, and ornamented with taste. There is a spacious palace, built wholly of this material, and partaking its imperfection. Drontheim also contains the remains of a cathedral, the largest

edifice in the country, and to which the whole population of the North came once in pilgrimage. The environs are very beautiful, with numerous country-seats, and lofty snow-crowned hills in the distance. Christiansund is also a small sea-port and fishing town in this province.

3327. *Beyond Drontheim commences Norrland*, a district rather than a province, the name being vaguely applied to all the north of Scandinavia. Relatively to Norway, it is marked by an increasing intensity of cold; the mountains, even at 3000 feet high, being capped with perpetual snow, and vast table plains or fields remaining covered with it during the whole summer. Potatoes, a branch of culture the absence of which is lamented by Von Buch, were found by Mr. Brooke to have been introduced; but they are small, sweet, and waxy. Grain, even of the coarsest descriptions, ripens only in a few favoured spots. The spruce fir gradually disappears, and shelter is necessary to allow the Scotch fir and the birch to spring up. The climate, however, is somewhat milder than that of regions under the same latitude on the Baltic; so that, while the ports of Stockholm and Carlscrona are shut during several months of the year, those of Norrland remain continually open. Yet in this dreary region occurs a busy scene of human action and existence. The numerous islands, and the deep bays between them and the land, afford spots to which shoals of fish come from the farthest depths of the North Sea to deposit their spawn. During the whole year, the herring affords a regular occupation to the Norrland boatmen; but from February to April, the shoals, migrating from thence, and from all the surrounding coasts, crowd to the Loffoden Islands, the central seat of the northern fishery. These islands form a chain parallel to the land, and separated by narrow channels through which the tides of the Northern Ocean rush with tremendous rapidity. The sea flows as in the most rapid rivers, and the name of stream is employed:—Malström, the famous whirlpool, Grimström, Sundström, which, when the tide is high, produce the effect of a mighty cataract. Waves are seen struggling against waves, towering aloft, or wheeling about in whirlpools; the dashing and roaring of which is heard many miles out at sea. The produce of the fishery, which has been rendered much more abundant by the introduction of large nets instead of hooks, is conveyed to Bergen in a great number of little barks. The Danish government endeavoured to form at Stromsøe a commercial depôt for the produce of Norrland; but in this bleak situation it has not flourished. The Russians come with numerous vessels from Archangel, bringing meal and provisions, which they give in exchange for the fish caught.

SUBJECT. 3. *Lapland.*

3328. *The vast region of Lapland* is divided from the rest of Scandinavia by a line drawn across it nearly coinciding with the Polar Circle, so as to render it almost entirely an arctic region. It consists partly of great chains of mountains, some of which are 4000 feet high, while other extensive tracts are level. Through these roll the Tornea, the Lulea, the Pitea, and other rivers of long course, and navigable for the few boats which have any occasion to pass along them. The Laplanders are a peculiar race, short, stout, brown, with black hair, pointed chin, and eyes rendered weak by exposure to the smoke and snow. They are divided into the mountain or wandering Laplanders, and those who dwell in what are called villages; but Kautokeino, which forms a sort of Lapland capital, when visited by Acerbi, was found to contain not more than four families and a priest. The swift-footed rein-deer, which they train to draw them in sledges over the snow, form their riches; the flesh and milk of these animals compose their food, and the skins their furniture. The tents of the Laplanders (*fig. 440.*) are formed by six beams of wood meeting nearly at top, covered with

MOUNTAIN LAPLANDER'S TENT.

cloth, a flap of which left between two of the beams serves as the door. The floor is spread with rein-deer skins, having the hair upwards, and which thus serve for either lying or sitting, the tent being too low to stand in, except in one place. A stone frame is made in the middle, for the fire; and there is a hole at the top, to which the smoke must find its way; but this it does not effect till it has thickly impregnated the whole tent with its fumes; which, however, are valued as affording a protection in winter against the cold, and in summer against the swarms of mosquitoes with which, during a period of short and extreme heat, the air is infested. The herds of rein-deer vary from 300 to upwards of 1000, according to the wealth of the possessor. All day they wander over the hills, and in the evening are driven, not without some occasional resistance, into an enclosed park, where they are milked. Each yields

only about a tea-cupful of milk; but rich, aromatic, and of exquisite taste. Linnæus mentions nineteen farms in which milk is prepared for food; but cleanliness does not preside over their cookery; and the use of the hand, without knife or fork, to carry every thing to the mouth, and of the tongue to lick the dishes, prevents an European from joining these meals with any relish. The Laplanders travel from place to place, and move their families, at the beginning of winter and summer, in sledges made in the form of a boat, and drawn by rein-deer (*fig. 441.*). These animals are tamed and trained with considerable difficulty, and they are sometimes restive; but, in general, they bound over hill and dale with surprising celerity. The natives have also a species of snow shoe; not a broad flat board, like that of America, but somewhat in the form of a skate, with which they

glide rapidly along the surface of deep snow, and even up and down the steep sides of the

441

LAPLANDERS TRAVELLING.

3329 The entire population of Lapland, spread over a surface of 150 square miles, is stated by Dr. Thomson not to exceed 60,000, or one inhabitant to every three square miles. Even this scanty measure is supported only on the sea-coasts by a supply of fish. The parish of Kautokeino, in the interior, extending 200 miles in length and 96 in breadth, was reported to Acerbi as containing not more than ninety families, of whom twelve only are fixed. The Laplanders are a harmless race, among whom great crimes are unknown. Only one murder has been heard of in twenty years; and the absence of theft is proved by that of bars, bolts, and other safeguards. Mr. Brooke discredits the charges sometimes made of the laxity of the marriage tie, and of the indulgence of the husbands on this head; and observes, in general, that love is only a lingering spark, barely sufficient to answer the purposes of nature. They do not show that open hospitality and warmth of heart, for which rude nations are so often celebrated. They are cold, shy, mistrustful, and difficult to treat with, at least unless tobacco or brandy be brought in as mediators. They were

442

LAPLANDER DESCENDING A SNOW FLAKE.

formerly very superstitious; and the Lapland witches were famous for their empire over the winds, which they enclosed in bags, and sold to the mariner. The magic drum (fig. 444.) and the enchanted chain (fig. 445.) are still in occasional use. Yet the Laplanders have been converted to Christianity, and are attentive to its duties, coming often from vast distances to attend divine service, though the instructions are conveyed to them only through the broken medium of an interpreter.

443

MOUNTAIN LAPLANDER.

founded, on the large island of Qualoe, the town of Hammerfest, the most northern in the world, and destined as a rival to Archangel; but the settlement has never taken

444

LAPLANDER WITH MAGIC DRUM.

impossible to leave the house without danger of being blown into the sea. At the northern point of this island is formed by the North Cape the grand boundary of the European continent, facing the depths of the Polar Ocean. It consists of an enormous mass of naked rock, parted by the action of the waves into pyramidal cliffs, down which large fragments are continually falling.

3330. The sea-coast of Lapland presents a continuation of the same bold and rocky features which distinguish that of Norway. Here, too, the fishery is carried on with activity. It is chiefly in the hands of a Finnish race, called Quans, who have pushed across Lapland, and exert an activity unknown to the natives of that region. The Russians from Archangel, also, not only bring their meal to exchange for fish, but carry on the fishery themselves to a great extent. In July and August they cover with their small three-masted vessels all the fiords and sounds, and throw out lines that are sometimes two miles long, and contain 600 or 700 hooks; so that their vessels are filled with the utmost rapidity. The government has

445

MAGIC CHAIN.

CHAP. XVI.

RUSSIA IN EUROPE.

3331. *European Russia* is the chief portion of an empire of enormous extent, with vast capacities of improvement, and standing at present, if not first, at least in the very first rank, among military nations. It may be considered either as including that great part of Poland which has been absorbed into it; or as comprising only old Russia, as it existed previously to the violent partition of Poland. Although there is little prospect, at present, that the acquisitions in Poland will be wrested from the empire, yet we have reserved for that fallen, divided country, a place and a name, which has afforded the proper occasion for treating of the Russo-Polish provinces. The empire shall now be considered only in a detached and independent view.

SECT. I. *General Outline and Aspect.*

3332. *European Russia* is bounded on the north by the Frozen Ocean, and especially by its great gulf, the Bieloe More, or White Sea. On the east, those grand natural limits, the mountains called the Urals, and the rivers Volga and Don, separate it from the Asiatic continent. On the south, it is bounded by the Euxine Sea and its gulfs, and by European Turkey. Westward, it unites with Russian Poland, which brings it in contact with the dominions of Prussia and Austria. It extends from about the 45th to the 68th degree of north latitude, and from the 24th to the 59th degree of east longitude; making about 1600 miles from north to south, and 1400 from east to west. The superficial extent, notwithstanding very extensive admeasurements, under the direction of the government, is by no means precisely ascertained. The great map, of one hundred sheets, drawn up chiefly from provincial surveys, gives to it an area of 1,490,000 English square miles. In 1795, the amount was reduced to 1,293,000, by a map constructed with very great care; but, from some cause or other, this did not include the provinces of Pultowa and Cherson, which, in the great map, had been rated at 59,000 miles. Since that time, many new astronomical observations have been made, and many errors rectified. Wichmann, in his "Monarchy of Russia," published at Leipzig in 1813, raised it to 1,396,000. The latest estimate made by Mr. Bramsen, in his work of "Russia and the Empire of Russia," published in 1819, raises it to 1,424,000. Humboldt takes it at 2,040,000; but he includes, we presume, the Polish territories. The discrepancies, as to the details, are still more remarkable, and prove that more accurate observations remain to be made, before this vast territory can be considered as duly surveyed.

3333. *The surface* of the Russian territory is the most level of any in Europe. That great tract of low land, which begins in northern Germany, expands in Russia to its greatest breadth, exceeding 1200 miles. A great portion, in the south especially, consists of those immense levels, called *steppes*, over which the eye may range for hundreds of miles without meeting a hill; only some large ancient tumuli occasionally diversify their surface (*fig. 446*).

446

TUMULI ON THE STEPPES.

They terminate only at the long chain of the Urals, which, rising like a wall, separates them from the equally vast plains of Siberia. The Urals are scarcely known, unless where the road to Asia passes over them: there they are neither very lofty nor very steep, but well wooded, and rich in minerals, especially on the Asiatic side. The mountains of

Olonetz, on the north, appear to be a prolongation of those of Sweden; while, on the extreme south, the Crimea displays some steep and picturesque, though not very lofty, ranges.

3334. *The rivers* of Russia are of the first magnitude; though the distant and insulated seas in which they terminate, incalculably diminish their commercial importance. The Volga is the greatest river of the empire and of Europe. It rises in the frontier of Novogorod, not far from the Baltic, and traverses in a S.E. line all the central provinces. After receiving from the Asiatic side the Kama, its greatest tributary, it flows chiefly S.S.E., forming the boundary of Europe and Asia, till, after a course of about 2700 miles, it opens by numerous mouths into the Caspian, near Astrachan. Large and broad streams, spreading over the southern plains, slowly make their way to the Black Sea. Of these the chief are the Dnieper, celebrated under the name of Borysthenes; the Don, or Tanaïs, one of the boundaries of Europe; and the smaller eastern stream of the Dniester. The Dwina, rising from a source not far distant from that of the Borysthenes, rolls a broad navigable stream towards the Baltic. Another Dwina, in the north, flows towards Archangel; and during

that brief portion of the year when it is free from ice, conveys to that remote haven the commodities of a wide extent of country.

3335. *Lakes* are not very characteristic of Russia; yet those of Ladoga and Onega, in the north, are several hundred miles in circumference, and form a sort of continuation of the Gulf of Finland. Finland also is covered with numerous winding lakes, of varied form and dimensions; but all these, surrounded by flat and bleak shores and frozen plains, present little that is striking in point of scenery, and afford few facilities for internal intercourse.

SECT. II. Natural Geography.

SUBSECT. 1. Geology.

3336. *Russia, including Poland.* In this region, which forms a vast plain, more or less completely bounded by mountainous and hilly country, the predominating formations are tertiary

and alluvial; those of an older date, namely, the secondary, transition, and primitive, occupying but comparatively small spaces.

3337. *Primitive and transition districts.* These are the Uralian mountains, Finland, and Russian Lapland; the northern parts of Carelia, and part of the government of Olonetz; the narrow tract extending, from the Island of Oesel in the Baltic, through Esthonia, Ingria, to beyond Vitegra; the country around Lake Ilmen; around Wologda; part of the Waldai mountains; the mountains of Sandomir; the tract extending from Brody, across the Bug and the Dnieper; part of the Crimea, and part of the Caucasus. In these districts we meet with the usual primitive and transition rocks, exhibiting similar characteristics to those in other countries.

3338. *Secondary lands.* These frequently appear rising like little islands in the great Russo-Polish plains. The following formations are met with:—1. Old red sandstone. 2. Coal formation, as seen in the coal-mines of Poland and Cracovia. 3. New red sandstone, with gypsum, salt, &c. 4. Shell limestone, which, in Poland, contains the famous lead-mines of Olkutz. 5. Keuper sandstone and marl, with gypsum and salt. In Russia there is a *northern salt district*, which stretches in a line parallel with what is called the Petersburg limestone, for 1000 versts: it makes its first appearance in the Island of Oesel, and is worked in several parts of the south of Livonia. *Gypsum* is quarried in many parts of this great tract. Mr. Strangway describes a *central salt district*, of great extent, in the course of the Volga. There is also a rich and extensive tract of red marl, salt, and gypsum, which extends down the course of the Kama, and is probably connected, on the south, with the salt district of the Volga, and on the north by that of Wologda. The principal salt-works are in the neighbourhood of Solikamsk; and the gypsum grottoes of Koungour, in the government of Perm, are of great size and magnificence. 6. Lias and oolite limestones. 7. Green sand formation. 8. Chalk formation.

3339. *Tertiary.* The rocks of this class, which occupy vast tracts of the low country, are clay, loam, limestone, *brown coal*, with gypsum, and in many tracts, as in Gallicia, rich deposits of *rock salt*. In central Poland, a clay, with *lignite or brown coal*, rests upon chalk, and is the oldest member, according to some geologists, of the tertiary class. Resting upon this deposit, formed in part by rivers from continents, there succeeds a deposit almost entirely of marine origin, and, consequently, abounding in marine shells. It is the tertiary *oolite limestone*, very extensively distributed throughout Poland, Podolia, and southern Russia. This tertiary limestone has not been found either in England or Italy; and is peculiar to Poland, southern Russia, and Podolia. It occurs, however, in the basin of Vienna and Hungary, and in France. It is the last depôt of that sea which covered all the country to the north of the Carpathians, from the Baltic Sea to the foot of that chain, and to the Black Sea, in the middle of which rose the mountains of Sandomir, and the plateau, south-west, in the form of islands. It is covered by a *marly clay*, and a *sand*, formed by the last great alluvial catastrophe, which gave to Europe its present form, and buried in its depôts remains of unknown species of elephant, mastodon, rhinoceros, &c.

3340. *Alluvial.* In the alluvial soil we have not in general the same marked limits between the old and new deposits as in the secondary class. The ancient alluvial deposits consist of a great deposit of marly clay or loam, and of numerous blocks of primitive rocks. This loam must be carefully distinguished from that which is deposited from the present rivers. It is a clay mixed with much carbonate of lime, generally of a yellow colour, and very easily frangible when dry: it is distinguished from potter's clay by the lime it contains, and from the marly secondary slates by its want of bituminous matter. In Poland it varies in thickness from 30 to 100 feet, and covers vast tracts of country. It forms the high banks of the Vistula; associated with marly chalk, the excellent soil which affords the wheat of Cracovia and of Sandomir: but, as we advance towards the north, it becomes more and more mixed with sands, gravels, and primitive blocks, and less and less fertile. It is this deposit which contains that vast abundance of extinct terrestrial animals in Poland. The bones and teeth of elephants are the most frequent: remains of the rhinoceros, aurochs, horse, deer, and some great cetacea, or whales, are also found, but less frequently.

3341. *An alluvial sand*, different from the sand of rivers, is widely spread in Poland. It is in great part formed from disintegrated sandstone rocks; but in many countries it is certain that the sand has not been brought from a distance, and has been formed on the spot. In this latter case, it cannot be distinguished from the loose arenaceous beds of the tertiary class. In the southern part of the district of Lublin, near to Chelm, in the country situated between Chmielnik, Staszow and Klimonton, the sand occurs only near to tertiary depôts, and we may almost be sure that it forms a part of them, and that it is not alluvial. The sandy soil of Poland commences on the western part, along the frontiers of Silesia; in the grand duchy of Posen it is connected with the great sandy plain of Northern Germany: it covers a great part of the districts of Kalisch, Masovia, Plock, Augustowa and Podlachia, the portion north of Lublin, and extends from thence into Lithuania and White Russia. In this plain of sand, and particularly upon and in the *loam*, we found numerous large and small blocks of primary rocks. At first sight, we might conjecture that these blocks had come

from the Carpathians; but a more careful examination proves the falsity of such an opinion. The only river which rises in the primitive soil of Tatra, and which intersects the great sandstone chain of the Carpathians, is the Dunajec; all the rivers rise from sandstone: hence the Dunajec could alone carry the primitive blocks into the plain of Poland. In truth, we find on the Vistula, at the débouché of the Dunajec, and a little lower down, boulders of granite and granitic gneiss, which are identical with those of Tatra; but these blocks occupy so small an extent, that they appear insignificant, when compared with those of the northern plain. There are, on the contrary, convincing proofs, that these primitive blocks have not come from the south, but from the north. First, their magnitude and abundance diminishes from the Baltic, towards the south, which is the contrary of what would be the case had they come from the Carpathians. Further, their southern limit passes, in the vicinity of Czenstochau, by Przedborz, along the northern foot of the mountains of Sandomir; and, on descending the Kamiona, by the Vistula, on Lublin, Lubartoro, across southern Lithuania, and still further into the middle of Russia. Lastly, the rocks do not correspond with those of the Carpathian and Sudetic chains; while they are identical with those of Sweden, Finland, and southern Russia. The observations of geologists on the same subject in Prussia, Livonia, and Courland, and in the north of Russia, concur to prove that they have been spread over the countries to the north of the Carpathians by a débâcle flowing from north-east to south-west. Our limits do not allow us to enter into detailed descriptions, but we may here cite the predominating rocks.

3342. *From Petersburg to the Dwina and the Niemen*, we every where meet with blocks of a granite resembling that of Wiborg, in Finland; another granite, with Labrador felspar, of Ingria; a red quartz sandstone, on the borders from Lake Onega, and the transition limestone of Esthonia and Ingria. In eastern Prussia, and in the part of Poland situated between the Vistula and the Niemen, the blocks are of a deep red granite, with little quartz, calcareous mica, and very little hornblende; a porphyritic granite of the same tint, with large crystals of felspar (*granite globulaire*); a grey granite, with much hornblende or syenite; a small granular red granite, principally composed of felspar and garnets; a coarse granular granite, with much green, grey, and red felspar, often Labradoric, with black mica, and with numerous large, trapezoidal red garnets (Warsaw); of syenite, diorite, and hornblende rock; of grey and red quartz rock; more rarely of common and hornblendic gneiss, of common porphyry, and antique green porphyry.

3343. *Among these rocks*, the first three occur in Finland, from Abo to Helsingfors: the coarse granite and the syenite come also from the north; the hornblende rocks appear to be derived from the south of Sweden, or the middle of Finland; the quartz rocks are exactly the *Fiall sandstein*, between Sweden and Norway; and the porphyries are those of Elfdal, in Sweden.

3344. *From Warsovia, on the west, towards Kalisch and Posen*, the red granite of Finland diminishes; but the hornblende rocks and the gneiss become more abundant, and the same is the case with the porphyry. We find there, in general, few rocks of Finland, and many of Sweden. This correspondence with the Scandinavian rocks cannot be mistaken. The garnet, epidote, hornblende, Labrador felspar, the predominating hornblende rocks, show, to every one acquainted with the Carpathians, that these blocks do not come from that quarter: further, the red and porphyritic granite, which is the most abundant, is entirely wanting in that chain. In connecting with this fact the known opinion that all the primitive blocks of the sandy plain of Northern Germany, of the Low Countries, and even of the east coast of England, have been transported from Norway and Sweden: this dispersion of the Scandinavian blocks, on this side of the Baltic and German seas, becomes one of the most extensive and singular of geological phenomena; its extent is immense, when contrasted with that of the dispersed blocks observed in Switzerland. In the Jura chain, and the tertiary plain, the last-mentioned fact has been explained by sudden débâcles of Alpine lakes.

3345. *The débâcle* which transported those northern rocks into Germany, Poland, and Russia, has also formed the marly clay, or alluvial loam: it has interred the elephants and rhinoceroses of an ancient time; it has broken up the chalk plains of the north; it has separated Denmark from Sweden; and given, in general, to the Baltic, and the gulfs of Bothnia and Finland, their present forms. On the other hand, the idea of Hausmann, that these blocks belong to the tertiary period, does not seem plausible.

3346. *In regard to the river alluvia*, it may be remarked, that they are of but inconsiderable extent in Poland. The Vistula, as the largest river, has formed the greatest quantity. The rivers of the Carpathians, which are rapid in their course, as the Raba, Skaba, Sola, Wisloka, Dunajec, and San, running almost entirely among sandstone strata, which yield readily to their action, carry much débris into the Vistula.

3347. *Peat is formed abundantly* in the marshy valleys, and the great marshes of this plain, but is, in general, of indifferent quality. *Bog iron ore* occurs in the great marshes of Lithuania, and in the district of Augustowa, and of Plock, in the plain of Gallicia; and is abundantly distributed in Great Poland and Russia. *Calcareous tuffa*, notwithstanding the abundance of calcareous formations, is rare, in general, in Poland.

3348. *Volcanic rocks.* The only rocks of this class mentioned by travellers are *trachyte*, which abounds in the Caucasian chain.

3349. *Mines.* In European Russia and Poland there are but few mines of importance; the principal mineral repositories occurring in the Uralians, Altaïs, &c. The following may be particularised: —

3350. (1.) *Western Uralian mines.* These are situated amidst the primitive and transition rocks, and are principally iron and copper; the more precious metals occurring chiefly on the eastern acclivity of that great range.

3351. (2.) *Central mining district of Russia.* This tract includes parts of the governments of Nishney-Novogorod, Vladimir, Tambof, Reza, and Kalouga; extending from a little above Mourom, on the Oca, to near the town of Kalouga. It is, in general, a very poor sandy district, and probably belongs to the red marl formation. Along it are situated several extensive ironworks; for, in general, the iron is manufactured where the ore is raised. These supply the principal consumption of that metal in the interior of Russia. One of the most considerable is the establishment at Vixa, and its dependencies, in the forest of Mourom, belonging to M. Bataskoff. The crown works at Tula exclusively Siberian iron: this is the principal manufacture of arms in Russia. The manufactory at Kalouga formerly attempted the finer kinds of cutlery, but failed. The ore of the central mining district is described as occurring, at 60 feet below the surface, in regular beds. Some of the beds are dark red and argillaceous; others are mere layers of large concretions: there are also regular strata of pale yellowish brown-coloured ironstone, which is the ore principally worked. Of the two latter varieties, the lightest coloured ores produce the most iron.

3352. *Copper sand.* On both sides of the salt country of the Urals is a vast tract of what is commonly called *copper sand*, which extends through a great part of the governments of Viatka, Perm, and Oufa, and completely skirts the south and west sides of the Ural mountains. The sand is of a dull red or green, and is commonly worked for copper. It contains fossil wood impregnated with copper.

3353. (3.) *Finland mines.* At Petrozavodsk, near Lake Onega, there are ironworks, said to be the most considerable in the north of Russia. The only kind of iron now smelted there is the bog iron ore, which abounds in the neighbourhood. The usual way to procure it is to drag the small lakes, especially those north-west of Petrozavodsk, which yield vast quantities of the ore. It is not found equally spread over all the lakes: often different parts under the same sheet of water will afford ore of various degrees of purity. We may add, that there is another great ironwork, of the same description, four versts from Petersburg, on the road to Riga.

3354. (4.) *Salt mines.* The Russian salt mines have been already noticed. In Poland, those of Wielicza and Bothnia are the most considerable, affording annually a vast quantity of rock salt.

3355. (5.) *Coal mines.* In European Russia there are no considerable mines of coal. Good coal has been found at Tula, where it is worked; but the quantity is so small, and the difficulty of working it beneath a loose and half-liquid bed of quicksand is so great, that it seems unlikely to be of much utility. Coal has also been worked at Bakhmout, in the government of Ekaterinoslaf; but to no great extent. In southern Poland there are numerous beds of black bituminous coal, resembling that of Britain, some of which are ten yards in thickness; and deposits of brown coal occur in the tertiary districts, which also afford *amber*. The amber is shown in that country to be an exudation from a dicotyledonous tree. From the characters of the tree, and the insects in the amber, a former warmer climate is indicated.

SUBJECT. 2. *Botany.*

3356. *Russia in Europe.* Vast as is this country, extending from 40° latitude almost to the extreme arctic region, it exhibits, over the greater portion of its surface, a vegetation very similar to what has already been described in treating of other European countries. The western portion is eminently analogous to Germany and the north of France; its northern parts resemble what we have described under the heads of Sweden, Denmark, and Lapland. On the east, the great chain of the Ural mountains forms a strong line of demarcation, separating the northern European from the northern Asiatic botany; and over this vast surface, winter reigns with excessive rigour; while the short summer, characterised by an almost tropical heat, induces a most rapid growth in the vegetable productions, and as rapid a decay in autumn. It is in the southern and south-eastern provinces of the empire that we are to look for the chief peculiarities; where the widely extended and celebrated *steppes* are bounded from Asia Minor by those great inland seas, the Caspian and the Black Sea, or by the inaccessible heights of the Caucasian and Circassian Alps. This country has been well investigated by the celebrated Pallas; but, before mentioning some of the more important productions of Russia, in general, as of the districts nearer the capital, we shall give a short sketch of those of the Crimea, a peninsula of the Black Sea, which,

from its geographical situation, climate, and soil, is the only region in the empire where all the productions of Italy and Greece might be introduced and multiplied, and where, indeed, many of them are indigenous; nor is any thing wanting to effect so desirable a state of things, save an industrious and well-governed population. No country, again, can be better suited to the Vine, Silkworm, Sesame, Olive, Cotton, Madder, Bastard Saffron, and other dyeing plants, which have hitherto been imported from the Baltic, the Caspian, and the opposite shores of the Black Sea, at a heavy expense. Even the indigenous produce of the country is most wantonly destroyed. The finest trees with which nature has clothed the mountains fall before the axe, in order to make miserable carriages, though only a small part be employed in their construction. For the naves, the strongest elms and ash trees are cut down, of which the solid root only is used; the most beautiful young oaks and beeches are felled for spokes, axles, and even for fuel; and the full-grown trees for fellies: yet when the wheels, constructed at such an enormous waste of timber, are brought to market, they frequently drop to pieces within a month after they have been purchased. Every winter, the Tartars burn, for their convenience, the fences of their fields and gardens; to replace which, the young shoots and coppices are unmercifully cut in spring; while the windfalls, and the wood needlessly felled, lie rotting in the forests. This waste of young timber, the sale of which affords the chief maintenance of the people, together with the numerous herds of goats, destroy all the young forests; so that large tracts of land, formerly clothed with lofty trees, are now overgrown with worthless bushes and underwood. The beauty of the spring season, which continues from March till the end of May, is well described by Pallas. At that time, not only are the senses gratified with the sweetest perfumes, wafted from the gardens and woods along the banks of the rivers, the last of which exhibit an infinite variety of wild fruit trees, white and red Roses, Lantana, wild Vines, Vitalba, and Jasmines intermingled; but likewise each hill and declivity, around the champaign country, is alternately diversified with the lovely colours of the flowers that every where clothe the earth; and sometimes one, sometimes another, species prevailing on different hills, according to their situation, aspect, or soil, vary and enrich the scene. Thus, at a distance, whole sides of mountains, and extensive tracts, covered with red and blue, purple or yellow tints, relieved by a background of shaded greensward, delight the eye with the most fascinating prospects. The fragrance arising from this profusion of flowers, especially March-violets, and the blossoms of trees, together with the grateful odours of the aromatic herbs, embalm the surrounding atmosphere.

3357. *The Tartars*, originally a wandering people, were induced to become husbandmen, in consequence of the narrow limits of their country; the increase of population; and, probably, from the example of the Greeks, Armenians, and Genoese, to whom they are indebted for their limited knowledge of rural economy, for their orchards, olives, figs, pomegranates, and their vineyards. Of wheats they have three kinds; summer and winter Rye, winter and summer Barley; Oats, but which scarcely come to perfection; Maize,

448

FLAX.

Millet, of two or three different sorts; and Chick Peas. The Flax (*fig. 448.*) is much esteemed on account of its fineness, and the length of the fibre. Their Tobacco is the *Nicotiana paniculata*, of which the young leaves are gradually removed, dried in the shade, and buried beneath hay ricks: there they turn to a brownish-yellow colour, similar to that of Turkish leaf tobacco, to which they are nearly equal in value. Sesame used to be cultivated, and rice; but the Russian government has prohibited the latter, because of its unwholesome tendency. In the gardens, Melons and Water Melons, Cucumbers (of which they grow a remarkably large Turkish variety, sown in April, and gathered in May, and which, when filled with meat and rice, is greatly esteemed), Gourds of various sorts, the Egg-fruit (also eaten stuffed with meat), the *Hibiscus esculentus*, similarly treated with the last, Jerusalem Artichokes, Potatoes, White Cabbages, called *Kapusta*, celebrated on account of their enormous size, apparently quite different from those of any other part of the world: they appear to derive their excellence from being watered and nourished by the *Dshuruksu*, which is impregnated with all the filth of the neighbouring town; Onions, from the culture of which many Tartars derive their whole support; Garlick, Leeks, Broccoli, Celery, Parsley, Carrots, and Red Beet.

3358. *The Grape* is not only an indigenous production of Crim Tartary, abounding in the mountainous parts, sometimes bearing oblong white berries, and sometimes small round black fruit; but it has been planted in different valleys and districts from the remotest periods of antiquity. Strabo mentions the culture of the vine near the Bosphorus, and the care taken to cover it with earth during the winter, or to bury its roots in the soil, in order to shelter them from the cold, as indeed is still practised in the vicinity of the Alma and

Katsha. Numerous kinds are grown, but comparatively with little success, owing to the prejudice and ignorance of the people; and they are exposed to injuries from various causes and circumstances. Caterpillars destroy the leaf and flower-buds, while locusts (the *Gryllus italicus*) devour what the Caterpillar has spared. Annually does the locust appear on the dry eminences, in the arid southern regions, from the European boundary, as far as the Irtish and the mountains of Altaï; but it is only in particular years that it multiplies in such numbers as to become pernicious. Thus, after the severe winters of 1799 and 1800, these locusts were so numerous in the Crimea, that they traversed the air in prodigious swarms, and, wherever they settled, they not only destroyed the herbage and culinary plants, but stripped the leaves from their favourite trees, committing great ravages, especially among the vines. The clusters of large but unripe grapes remained till the end of September on the denuded vines, without increasing in size, filling with juice, or ripening; so that they were hard and green, like peas, and thus afforded ocular demonstration of the detriment that must arise from the practice of pulling leaves from the vines, which is recommended by many cultivators. It was not till October, when the vines had again acquired leaves from the collateral buds, that they ripened, though imperfectly, and afforded bad acidulous must. In a winged state, these locusts at length devoured the foliage of the trees; and the *Fraxinus Ornus*, or Manna Ash, in particular, was every where seen stripped to its very summit; nor were Orange and Nut trees exempted from their depredations. In the following year, these vermin appeared still earlier, and in increased swarms, spreading over the country in vast bodies, and advancing at the rate of one hundred fathoms and more in a day. Although they prefer advancing by the roads, or over open tracts, yet they will penetrate through hedges and across ditches: their way can only be impeded by brooks or canals, as they are apparently afraid of every kind of moisture. Often they attempt to cross by means of overhanging boughs, and pass in close columns on the stalks of plants and shrubs, where they seem to rest, and enjoy the refreshing coolness. Towards sunset the whole swarm collect, and creep up the plants, or encamp on slight eminences. Woe, then, to the vineyards where they settle for the night; and if the following day be cold, cloudy, and rainy (in which weather they never travel), they not only consume all the weeds and vine-leaves in it, but, frequently, when these fail, they completely strip the bark and buds off the young twigs, so that these shoots remain throughout the entire summer as white as chalk, and full of sap, without producing fresh foliage. The same fate awaits those places on which they settle for the purpose of casting their skins. It is remarkable, that while the vine-blossoms continue closed the locust does not attack them; but as soon as they are blown it devours the whole, in the most rapacious manner, the stalk only being spared. Their favourite food is generally the plants found in vineyards, as *Carduus tataricus*, *Salvia nemorosa*, *Millefolium*, *Melilotus*, *Cerinthe*; the fetid and poisonous *Conium maculatum*, which does not, however, prove fatal to them; the *Asparagus volubilis*, *Ebulus*, *Coronilla varia* and *valentina*, various kinds of *Geranium*, *Linum*, and *Inula*; *Centaurea solstitialis*, and all bitter vegetables. On the other hand, the locusts do not prey on grasses; some species of grain, as Millet, are also spared by them, and Sedge, which is the favourite food of the great erratic locust, together with the *Aristolochia Clematitis*, which grows luxuriantly in vineyards; *Clematis Vitalba*, the *Euphorbiæ*, *Rumex Patientia*, *Mentha sylvestris*, *Artemisia maritima*, *Contra*, *pontica*, and *austriaca*; the rough *Echia*, all the *Atriplices* and *Salsolæ*, the *Stellera passerina*, the milky *Sonchus*, *Chondrilla* and *Prenanthes*, *Rhus coriaria* and *Cotinus*. After having consumed every other vegetable, they attack the Caper buds, the *Beta Cycla*, and *Euphorbia*; to the latter of which it must probably be ascribed that many of the locusts, firmly adhering to these plants, ultimately perished.

3359. *In the orchards*, the Crim Tartars have a great variety of fruit. Pears of several kinds, of which the Duli is particularly esteemed, and is remarkable for being thicker in the middle than at the top. Of Apples, numerous waggon-loads are, in the autumn, sent to Moscow, and even to Petersburg, especially of the sort called Sinap Alma, or Apple of Sinap, and, as may be supposed after such a trajet, they are sold at a very high price. These fruits will even keep till the July of the following year. There are summer and winter Quinces; with a third sort, that is cultivated along the Caucasus, and, possessing no astringency, may be eaten raw. Plums and cherries are of several kinds; but the larger description of stone-fruit, such as Peaches and Apricots, are scarce and indifferent. The Service tree, the Cornel Cherry tree, and the Lotos (*Diospyros Lotos*), are found both wild and cultivated: the first seems to be generally prized for its wood; and of the second, the fruit is gathered in large quantities, and suffered to ferment, for the purpose of converting it into brandy. To this list may be added the Pomegranate, Mulberry, Walnut, Hazelnut, the *Corylus Columna*, and Figs.

3360. *With regard to the trees and shrubs*, the mountains of recent formation produce them of small stature, except along the banks of rivers and brooks; but the southern mountain district, where the old formation prevails, abounds in forests, and the valleys between the loftiest mountains are interspersed with enormous Oak, as well as red and white Beech trees, which are equally useful in naval and domestic architecture.

3361. *Among the evergreen trees in the Crimea, the most conspicuous are the Sea Pine (*Pinus maritima*), called by the Tartars *tzaam*, and two species of Juniper. The former grows chiefly on the high mountains by the sea-coast. The largest beams afforded by it are about two or three fathoms long. Its wood is durable and resinous, but very knotty: the resin may be collected in large quantities from it. There are two kinds of Juniper, one bearing red, and another black berries. The former seems to be *Juniperus Oxycedrus*, and is a small inferior tree or brushwood; the other forms trunks more than a foot in diameter, with wood smelling like Bermuda Cedar. To these trees may be added the Yew: it attains a considerable height and thickness in the valleys of the Alps, or Yaila, where it is by no means rare.*

3362. *The following umbrageous trees occur in Crim Tartary: — Two Oaks, the common and the Cerris; the latter seldom growing high, as it is eaten down by goats; three kinds of Beech, which inhabit various situations, and attain different degrees of stature; the Dwarf Elm, which is very common, and whose far-spreading roots are highly injurious to vineyards and orchards; it is different from the tree of Siberia, and its trunks seldom exceed a foot in diameter: four kinds of Poplar, the white and black, the Aspen and the Lombardy Poplars; the latter was introduced from Italy, and has received from the Turks the appropriate name of Salvi, which is also applied to the cypress, that it greatly resembles. These trees thrive extremely, and, being cleared of the low shoots, form beautiful pyramidal heads, and attain an astonishing height. Notwithstanding their solitary and often exposed situations, they have never been known to be shivered by lightning, broken by stones, or torn from the soil; their long and vigorous roots running to great distances, and attaching them firmly to the ground. Their wood is extremely hard, but easily injured by moisture. The Linden tree, and the Maple, or Plane; also the common Maple (*Acer campestre*), called by the Tartars the Spoon tree, because its wood makes excellent spoons. Two kinds of Ash; the common species, inhabiting the cold, and the Manna Ash, the warmer, southern spots. Several Hawthorns, particularly the black-fruited one, and the varieties with brown and with large reddish berries; also the *Oxyacantha*, with small red fruit; and *Cratægus Aria*, *torminalis*, and *orientalis*.*

3363. *Among the wild fruit trees are the early and late Apples and Pears; three kinds of Cherry, a small sour-fruited species, a light red and sweet Cherry, and lastly, the Mahaleb Cherry, whose wood is veined, and diffuses, when the trunk is felled, an agreeable odour, resembling that of bitter almonds, which the wood also retains for a long period. The fruit, which is bitter, and called by the Tartars Dog cherry, is the principal ingredient employed for preparing ratafia and cherry brandy. Wild Plum trees are not very common; but the Sloe grows in the greatest luxuriance. The Turpentine tree occurs sometimes in the southern parts, near deserted valleys. it is, perhaps, an exotic; the trunk attains a thickness equal to a man's body, and the wood resembles Guaiacum, both in weight and colour. The Strawberry tree (*Arbutus*) thrives only on steep rocks, exposed to a meridian sun; it is more prized for its beauty and fine wood than for the fruit, which is deficient in juice.*

3364. *In the mountains and forests are the following low shrubs: — the round-leaved Alder; two species of Spindle-tree; the Water Elder; the Wayfaring tree, or Lantana, from the wood of which the Tartars manufacture the tubes of those tobacco-pipes which are in such great request in Russia and Germany, and known there by the name of Gordina, or Gordovina; two sorts of wild Rose; the Privet; the wild Cornel, and the wild Vine; the trunk of the latter being as thick as a man's arm, and its branches ten or fifteen fathoms long. The Virgin's Bower (*Clematis Vitalba*) twines around trees, and finally stifles them; its blossoms diffuse an agreeable smell; and Ivy, which, however, seldom produces a considerable stem.*

3365. *The shrubs growing in open situations are the Christ's Thorn (*Paliurus*); two species of Tamarisk (*T. germanica* and *tetrandra*), flourishing in the beds of rivers; a weak kind of Willow, not the *Salix babylonica*, which, however, though not indigenous, thrives uncommonly well: the Berberry and Brambles; the Elder and Ebulus; the Sumach, or Tanner's tree, of which the acid red berries are an important ingredient for the preparation of animal food, and the whole plant excellent for tanning; the Cotinus, or Jews' Leaf, so called because the Jews particularly employ it in tanning morocco; the Medlar Thorn, or *Pyracantha*, named also Devil's Thorn; the *Mespilus Amelanchier*; the Judas tree (both the latter are scarce); the grey *Spiræa*, yellow Jasmine, Spanish Lilac, and Italian Honeysuckle, *Coronilla Emerus*, *Colutea arborea*, Saltpetre Wort (*Nitraria*), Caperbush, *Salsola ericoides*, and, finally, the *Astragalus Poterium*, or Bastard Buckthorn, of the Crimea.*

3366. *Of the plants useful to the Crim Tartars for economical purposes, Pallas observes that no nation is better qualified to instruct us in the nature and properties of esculent vegetables than the Greeks, who are compelled, by the strict fasts of their church, especially in the spring, to search for every edible root and herb. Thus, they eat the thick roots of some abundant species of *Scorzonera*; of the very common *Ornithogalum pilosum*; of *Lathyrus pilosus*, *Chærophylloides tuberosum*, and *Hordeum bulbosum*, which last is called by the*

Tartars Earth Nuts; further, the sprouts of the wild mountain Asparagus, of *Sisymbrium Loeselii*, and *Crambe maritima*, which last greatly resemble broccoli; and the stalks of a species of *Heracleum*; the young leaves of *Rumex Patientia*, and of the Goosefoot, or wild Orache; of the Vine, the Berberry, and even the acrid *Arum maculatum*, also the Corn Salad, or *Valeriana Locusta*, that sprouts early in the spring; Brooklime, thriving in running waters throughout the winter; wild Purslane; Dandelion, while it is germinating; wild Celery; common Garlic, or *Allium descendens*, and several others. Of the Caper-bush, they eat not only the young shoots, greatly resembling asparagus, but likewise the buds, fruit, and every other esculent part of that shrub. They have not been observed to use the Sea Cabbage, though they are well acquainted with the *Crithmum*, the genuine Rock Samphire of England.

3367. *There is an abundance of vegetables in the Crimea*, affording excellent food for cattle, and consisting not only of a great variety of grasses, but also of the best vegetables, recommended for artificial meadows: for instance, the white and yellow Melilot; the white Mountain and Bastard Trefoil; Hop Clover; the large red Trefoil; several kinds of Medick, such as the Swedish and common Lucerne; the *Esparsette* of the French; various fine species of Vetches; the Lotus and Coronilla; the common Goat's Rue, or Galega; the common Burnet Saxifrage, or *Pimpinella Saxifraga*; the *Poterium Sanguisorba*, &c. The mountains, as well as the champaign country, present good pasture for sheep; and, in ordinary winters, the flocks are suffered to remain in the fields. Camels find rich food in the *Centaurea ovina*, Kali, and other prickly plants; nor is there any scarcity of seeds for feeding poultry.

3368. *Of plants useful for dyeing*, Crim Tartary produces, in a wild state, Madder, some fine species of mountain Goose-grass, Woad, Dyer's Green weed in great abundance; and, on the southern coast, even the Litmus, or *Croton tinctorium*; the Safflower succeeds uncommonly well in gardens. The genuine oriental Saffron may also be cultivated with advantage: of the four indigenous species of *Crocus*, two produce their beautiful blossoms in the spring, and two in the autumn; but none yield the real Saffron. The seeds of the great *Pæonies* are surrounded with a red pulp, the juice of which affords a fine and durable purple dye.

3369. *For tanning*, the Tartars possess valuable plants in the Sumach and *Cotinus*. They might also make use of the Tamarisks; the dwarf grey Oak; the small Hornbeam tree, which covers whole mountains; the roots of the *Statice coriaria*; wild Sage; and the common Periwinkle (*Vinca*). In fact, no branch of manufacture promises to be more lucrative to the inhabitants of the Crimea (which supports very numerous herds of cattle), than tanning, and the Turkish harbours present a certain and profitable mart for all sorts of prepared leather.

3370. *Among the plants delighting in a saline soil*, there is an abundance of the different species of Saltwort: not only on the Crimean coast, and around the lakes, but also in every situation where the earth is in the slightest degree impregnated with salt or nitre, the *Atriplex lacinata* grows in profusion: from the latter plant, several Greeks have acquired the art of burning excellent Soda, or Kallia, which is exported to Constantinople, and even to the more distant maritime towns of the Mediterranean.

3371. *Numerous medicinal plants*, which are at present obtained from the Levant and Greece, might be cultivated in Crim Tartary; where many, indeed, are indigenous.

449

HEM. 31 P.

Among other natural productions, genuine Turpentine might here be collected. The *Convolvulus Scammonia*, *Pæonies*, the roots of which are very aromatic; the *Belladonna*, together with those salutary herbs in fevers, *Chamædryes*, *Chamæpithys*, and *Scordium*; Rue and Sage, Balm, Pontian Wormwood, *Dictamnus albus*, *Ruscus*, and other officinal plants, grow in abundance on the mountains, and are very efficacious. Beside other marine vegetables, flourishing on the rocky and stony banks in the sea, there occurs the peculiar Worm herb employed by the Greek apothecaries, and which they also distinguish by the corresponding name of *Helminthochorto*.

3372. *If such are the valuable vegetable products with which nature has blessed the south of Russia*, we shall find that many of those of the north are scarcely less important to mankind: there, Maize and the finest Wheats give place to Rye, Barley, and Oats; the culture of the Mulberry and Vine to that of Hemp (*fig. 449.*) and Flax, such vast quantities of which are annually exported, as to form a staple article of trade, and which thrive, as does the potato, so high north as Archangel. The stately Oak is replaced by the graceful Birch, and the *Pinus maritima* by the *P. sylvestris*, or

Scotch Fir. Indeed, the most common species of wood in the immense tracts of forests* extending over the northern parts of the Russian empire consist, for the most part, of the Pine tribe. In some places, the pine trees grow to a great height and size. The Scotch Fir (*Pinus sylvestris*) is by far the most abundant, and, retaining its foliage during winter, gives shelter to man and to the wild animals of the forest, and greatly enlivens the dreariness of these bleak regions. The greater the intensity of the cold, the firmer and more dense does its timber become. This tree furnishes the peasantry with materials for constructing their cottages, boats, fences for enclosure, and with fuel. It is from the ashes of this tree that the potashes of Russia are principally obtained; and from the roots an abundant supply of turpentine is collected by the peasantry, by a very rude method of distillation.

3373. Next to the Fir ranks the Birch (figs. 450. and 451.) of which vast forests exist in

LEAF AND FLOWER OF THE BIRCH.

various parts, particularly in Finland, and about Moscow and St. Petersburg. Besides supplying a large portion of the firewood, and many household utensils, the natives extract a kind of wine, by fermenting its juice, which is sold at Moscow at two rubles a bottle. The bark serves to make cordage, fishing-nets, and sails for the boats used on the lakes, as well as for dyeing the nets, and tanning. The peculiar odour and colour of *Russia leather*, which is so much esteemed by bookbinders, and is said never to be attacked by insects, are due to a kind of oil, extracted from the birch, which is called *diqjet*, birch-oil, or birch-pickle. An extensive use is made of the leafy twigs in the vapour-baths.

451

THE BIRCH.

3374. The Lime (fig. 452.) is nowhere, perhaps, rendered so subservient to the use of man as in the Russian dominions; and, on account of its great value, it is, by law, commanded

* See Dr. William Howieson's "Account of the Forest Trees and Timber Trade of Russia," for an interesting account of this branch of the natural productions of the empire, and from which we would extract more largely, did the nature of the present work allow of our doing so.

452

THE LIME.

to be planted on the borders of many of the great roads; and these trees furnish the bees with a large quantity of honey in their frequent flowers. Garden-mats, so extensively employed in our country, and called bast matting, are all imported from Russia, and are derived from the inner bark of the *Tilia europæa*. The same substance affords ropes, which, though wanting the solidity of hempen cordage, yet, being very cheap, and not liable to rot, are commonly used in many places for drawing water from the wells. To bark the limes for this purpose, it is customary to grow the trees in rows, and cut them every ten or fifteen years, generally in the month of May, at the time when they are full of sap, which renders the removal of their bark easy, so that it is pulled off in long stripes, measuring fifteen to twenty feet. As soon as the bark is dry, it is rolled up in bundles and kept in a cool place; and, when required for use, it is steeped for several days in water, by which the cortical layers, which constitute its thickness, become readily separable. The most internal part is the best, and is employed for making cordage: the exterior and coarser layers serve for strings to fasten corn-sheaves, and for hay-bands, &c. Mats were formerly manufactured in France from lime-bark; but the practice is now discontinued: a good paper may also be obtained from it. The trunks of lime trees, stripped of their bark, are employed according to their size; the larger ones by turners and the slenderer by vine-dressers and gardeners, for their ladders, and for the props of espaliers, &c.

3375. The Beech, Maple, Elm, Alder, Willow, and Ash, are the other forest trees of northern Russia, for the Oak is scarcely known there; and these form but a small proportion in comparison of the Pine. On the outskirts of the forest, the Mountain Ash abounds. Its fruit is preserved in spirits, and used by the native Russians at their ordinary meals, salted with other wild berries. The value of the forest trees to the Russians is admirably summed up by Dr. Howieson, in the memoir above quoted. "They furnish them with fir timber of the finest kind, possessing the most durable and dense texture, and in the most profuse abundance, with no trouble but that of cutting down. Of this timber, as already mentioned, with the addition of a little dried moss, stuffed into the interstices, they construct their *isbas* or cottages, vapour-baths, and other buildings. In the interior, they make little or no use of brick, stone, or lime, except in the construction of churches, *peatches* or stoves, and chimneys. Their wooden *isbas* are also warm and comfortable, and superior, in such a climate, to those built of brick and stone: they are soon heated, and when once this takes place, they retain heat long. Of this timber their furniture and utensils are also made. In large cities, and in the houses of the nobility in the country, of late years, they are gradually introducing mahogany, which they get from America, at a reasonable rate, by vessels coming for Russian produce, which would otherwise arrive in ballast; and this they prefer, from its beauty, to the timber of their own growth, for making furniture.

3376. "The peasantry have little or no tallow or oil: what they can procure is entirely consumed at the shrines in the churches, and before the images in the *isbas*. To supply the place of candles, they take long billets of that species of fir tree which abounds most in resinous matter; these they dry carefully near their *peatches*, during the tedious winter, and split, as occasion requires, into long pieces, resembling lath for a house. When a traveller arrives, or when a light is wanted, one of these is kindled at the *peatch*, and fixed in a wooden frame, which holds it in a horizontal position. It gives a bright flame, and burns for a short time, when another is substituted.

3377. "The extensive forests furnish to the proprietor a considerable addition to his revenue, from the potashes, charcoal, and turpentine which they afford. The potash, or vegetable alkali, is made from every species of wood indiscriminately. When a sufficient quantity of ashes is collected, they lixiviate them, and pack them up into casks. These are conveyed down from the interior, by means of inland navigation, to Petersburg, Riga, and other seaports, where they are kept in extensive warehouses belonging to government. There they are broken up, the ashes collected in heaps, the good carefully separated from the bad, and repacked in the presence of the foreign merchant who purchases them. In passing through the country during the night, great volumes of flame may repeatedly be seen issuing from the woods; and, during the day, while travelling through the forests, it may be observed that many of the finest trees have their internal part burnt completely into charcoal, from the fire ascending up the centre of the trunk, while the bark remains entire, and seemingly uninjured. To make charcoal, they cut down every species of wood indiscriminately, form it up into large cones or piles covered over with turf, set fire to them, and allow the combustion to advance in a slow progressive manner for some days. The cone is then pulled down or scattered, the charcoal collected and sent to Petersburg, Moscow, and other great towns,

where it is consumed in the large works of government, as powder manufactories, founderies, and in kitchens, in great quantities. The mass of wood consumed in these various ways must be very great.

3378. "*The forests supply turpentine*, with little labour, and at almost no expense. It is the different species of Fir tree, or Pine, which yield this article: it is distilled from the bottom of the trunk, and the roots, which are left in the earth when the tree is cut down. These are dug up, and broken into chips by the hatchet, then put into the boiler, and the turpentine extracted by distillation, the refuse of the boiler furnishing fuel for the next fire. During the course of the day, with one of these boilers, a peasant will obtain, upon an average, four to five pounds of turpentine: and even this quantity might be considerably increased. If the number of stills, upon a larger and more economical principle, were increased, the quantity of turpentine which might be obtained in the course of a year upon the proprietor's estate might be very considerable, and would much enlarge his revenue.

3379. "*The forests also furnish materials for the roads*. The young fir trees having their branches lopped off, are laid longitudinally across the road, close to each other, and covered with a layer of earth or sand, to fill up the interstices. Roads of this description are formed by the peasantry over hundreds of versts, and through marshy ground, which could only be done in a country where wood is in such abundance. Upon one part of the great Moscow road, however, they have lately been collecting large masses of stone, which they break down by fire of peat or moss placed under them, when they are rendered brittle by the severe frosts. It is among these forests that the wild honey is got for which Russia is celebrated. Mead, made from it, is in great estimation among the peasantry, and is sold in the towns as a substitute for sugar, and various other purposes. Considerable quantities of this honey are annually exported to Great Britain and other countries. The wild bees make their hives in the hollow trunks of the aged or injured trees, where they are sought after by the straggling woodmen. The exportation of timber affords a considerable addition to the revenue of the government, as well as to the private fortune of the proprietors. It is a grand source of labour to the industrious peasantry settled upon the estates, and likewise to the shipping and inhabitants of other countries. These forests consist entirely of natural wood, which receives neither the care nor the industry of man during its growth. Labour, however, might be employed to much advantage in thinning and clearing away the superfluous trees when young, so as to allow the air to circulate freely among those which might be permitted to remain and grow up to a full size. In the forests, the trees are so thick that they destroy each other before they attain to any considerable size; and, in that way, it is only a few of the strongest which survive the general wreck. The wood of considerable girth, which was to be found in the vicinity of the roadsides, rivers, lakes, or canals, particularly in the neighbourhood of great towns, has been of late years cut down, and little or none but that of a stunted description remains in its place. The timber felled for the use of government, and for exportation, is now procured from a very great distance, hundreds and sometimes thousands of versts, into the interior; and that distance is gradually increasing. Even there, it becomes necessary to bring it a considerable way from amongst the forests, where it is cut down, to the lakes or rivers, by means of which it is floated to the seaport towns. Labour, however, in the interior of Russia, is of little value: it costs the nobleman next to nothing. The peasantry upon his estates, being a kind of slaves, receive no regular wages."

3380. *The brushwood*, covering a vast extent of forest country, consists almost entirely of the Hazel, the Dwarf Birch (*Betula nana*), the Alder, Willow, and Juniper: the last growing to a large size, and loaded with fruit. In other places, the surface of the earth is covered with

THE CRANBERRY.

various wild berries, especially the Cranberry and the Buisnika, or wild Bilberry. These various fruits are produced in the greatest abundance, and supply the peasantry with an ample and constant addition to their other food: they use them when fresh during the summer, and salted for winter. The peasant and his family seldom sit down to a meal which is not one half composed of these preserved fruits. The *Vaccinium Oxycoccus* (fig. 453.), or common Cranberry, is by us so much esteemed, that our own country, though affording a large supply in the extensive wet moors of the north of England and south of Scotland, does not yield enough for our consumption; and its fruit is

extensively imported from Russia for the sake of making tarts.

SUBJECT. 3. Zoology.

3381. *It is difficult to separate the Zoology of European Russia* with precision from the Asiatic portion of this vast empire; although enough is known to show that each possesses peculiar features. The immense extent of territory stretching from the icy regions to the shores of the Black Sea may naturally be supposed to contain by far the largest proportion

of the European animals ; while, to the eastward, the great Ural mountains seem to impart to this Fauna several of those more characteristic of Western Asia. To dwell upon these geographic distinctions would be unsuitable to this work ; we shall, therefore, confine ourselves to a brief notice of those animals which appear more peculiar to European Russia.

3382. *The quadrupeds are numerous.* The dreary regions of Nova Zembla are frequented by the great white bear, which seldom passes beyond the limits of eternal snow : arctic foxes, and all the polar animals, are likewise met with. Towards the central provinces, wolves, brown bears, and the other European animals, abound in the forests ; but the wild oxen, once known to inhabit Lithuania, are now extinct.

3383. *Three of the most remarkable quadrupeds*, all of a smaller size, are, the Bobac, the Soulsk, and the Alpine or Calling Hare. The first is sometimes called the Poland Marmot (*Arctomys Bobac*) (fig. 454) : it is rather

POLAND MARMOT.

larger than the hare. Its habitations are not so lofty as those of the common Marmot ; it prefers a dry soil, in which it digs very deep burrows ; and so careful are they to secure warmth, that they amass as much dry grass in a single burrow as will feed a horse for one night. The celebrated Pallas relates, that, when they have occasion to transport a quantity of provisions to their burrow, one of the party, lying on its back, is laden by the rest in the manner of a cart, and then all proceed in a party, drawing their companion by the tail to the common magazine. It must be confessed this story appears so incredible, that the illustrious name of Pallas alone induces us to repeat it.

3384. *The Soulsk*, or variegated Marmot (*Spermophilus Citellus*), is the most elegant of its genus ; being spotted, or waved, with white on a brown ground. It is partially carnivorous ; birds and small quadrupeds having been found in its hoards.

3385. *The Alpine Hare*, or Pika, inhabits only the highest mountains of northern Europe, in the thickest and most sequestered forests. The instinct for amassing provision against winter is highly developed in this defenceless little animal. About August, they cut and collect large parcels of grass, which they spread and dry, and, in effect, convert into hay : this they collect into stacks about seven feet high ; they then excavate a subterraneous passage from their burrow, which opens under the stack, and this road is used to give them access to their provision, during those months that a Siberian winter buries every thing under the snow.

3386. *Several birds, common in Russia*, are but rarely seen in other parts of Europe. Among these may be mentioned the Cock of the Rock, the largest known species of grouse, nearly as big as a small turkey. The beautiful Rose-coloured Ouzel, or

THE CROSS-BILL.

Starling, is not uncommon in the provinces bordering upon Asia ; while the Pine Finch, the Cross-bill (fig. 455.), and a few others of less note, inhabit the dreary pine forests. In the plains has been found the Cream-coloured Plover, so rare a bird in Britain, that a specimen, shot in Devonshire, was once sold for nearly 30*l*. This is now in the British Museum. The European Bee-eater is said to breed in great numbers in the banks of the southern rivers.

3387. *Domesticated animals.* No recent information has reached us on the present breeds of the horse, ox, and sheep. The first are said to be large, strong, and even beautiful ; but the ponies of Archangel are not larger than those of Zetland. The flocks of sheep appear to be numerous, and many of the breeds excellent. Whether the camel is really used in the southern provinces, as a common beast of burden, appears somewhat doubtful. The Russian greyhound has long and bushy hair, and the tail forms a spiral curl.

SECT. III. Historical Geography.

3388. *The southern part of Asiatic Russia* was known, under the name of Scythia, to the Greeks and Romans, who applied to it especially that appellation which was afterwards so widely extended. The expedition of Darius showed the Scythians to be exactly what the rudest Tartars now are, — a roving, nomadic race, constantly on horseback ; who fought flying, and, by their rapid movements, baffled, usually in a disastrous manner, every attempt of regular armies to subdue them.

3389. *The monarchy of Russia* seems to have been first formed about the ninth and tenth centuries, under the reigns of Ruric and Vladimir the Great. At that time it held some intercourse with the court of Constantinople, and was converted to the Greek church, which has ever since been the established religion.

3390. *The invasion by the Tartars*, under the successors of Zingis, in the twelfth century, formed a fatal era in the Russian annals. The whole country was over-run, its capital reduced to ashes, and the people completely subjugated under the yoke of Oriental despotism. Despotic ideas, and eastern habits, derived from this source, have ever since continued to prevail in Russia.

3391. *The re-establishment of the monarchy*, under the name of Muscovy, began in the fifteenth century, under Ivan Vasiljewicz. The Tartars, however, made a desperate stand ; and it was not until after a series of victorious reigns that they were driven beyond the limits of Europe. During this period, the great republic of Novogorod, which had held the chief

sway over northern Russia, was absorbed in the monarchy. A handful of Cossacks penetrated into Siberia, subdued the whole extent of northern Asia, and made the czars masters of an empire equal in superficialities to the Roman. But the monarchy, though aggrandised in every direction, continued immersed in ignorance and barbarism, and had as yet no place or influence in the general system of Europe.

3392. *The civilisation of Russia* began with the reign of Peter, one of the most remarkable eras in the history of the world. The wonderful steps by which that prince succeeded in giving to his kingdom so great an impulse, are familiar to almost every reader. His patriotic magnanimity, in quitting his throne, and labouring as a carpenter in the docks of Amsterdam and Portsmouth; the active spirit of improvement introduced on his return, in defiance of all the prejudices of a people wedded in the most superstitious manner to ancient habits, produced a change the most rapid and striking ever effected upon any nation. Before the death of Peter, Russia had taken her station among the civilised powers of Europe. Since that time, her improvement has proceeded steadily, and her influence has been continually increasing. Under Catherine and her generals, especially, the conquest of the Crimea, the defeat of the Turks, the victorious wars in Germany, and the violent dismemberment of Poland, progressively increased the power of Russia, and brought her more closely into contact with the other members of the European system. But the events of the last war produced this effect in a much more remarkable degree; when Napoleon, after having subdued all the other powers, found in Russia alone one that was able to cope with him. That power, at length triumphing, became the centre of the confederacy by which his empire was subverted, and the independence of Europe re-established; in reward for which services, she hesitated not to claim a considerable share of the booty. In short, Russia is now, by many politicians, acknowledged as the most powerful state on the European continent.

SECT. IV. *Political Geography.*

3393. *The government of Russia* is despotism, under which the knout is administered even to nobles of the highest rank who may have incurred the displeasure of the sovereign. The emperors have, indeed, endeavoured in some degree to mitigate this absolute power, and have even formed a directing senate of sixty-two members, divided into departments; but this body is entirely composed of individuals nominated by the monarch, and serves little other purpose than that of promulgating his *ukases* or decrees. It is believed, indeed, to have sanctioned the murders of unpopular or weak sovereigns, which have so frequently stained the Russian annals; and which have been conducted with a secrecy, and been followed by an exemption from punishment, which shows that they had been approved by the principal persons in the state. There are also hereditary nobles, who possess immense estates, estimated, not by the amount of lands or rents, but by the number of slaves; yet the titles conferred and recognised by the government are all military. The ranks of colonel and major-general are conferred, in a manner purely honorary, upon professors, and even ladies, as the only mode of raising them in the scale of society. Justice is administered with considerable care: conjointly with the judges are appointed assessors, who must be of the same rank as the person tried, and thus somewhat resemble our jury; but a general corruption, the inevitable fruit of despotism, and of the inadequate payment of the functionaries, is alleged to pervade this, and, indeed, all the official departments. It is not, however, to be denied that the views of the supreme government have, for the most part, been highly liberal, warmly devoted to the improvement of the empire, and to the moral exaltation of its people among the civilised nations of Europe.

3394. *Slavery* is general in Russia. All the lands, with the exception of a few corners, are cultivated by serfs; and, as already observed, the value of a nobleman's estate is reckoned by the number, not of acres, but of slaves. The sovereign power has been generally exerted in a beneficent manner, to ameliorate the condition of the slaves, and to promote their emancipation, but hitherto with very imperfect success. Their treatment, on the whole, is far milder than in the West Indies: still the most abject submission is required, and the lash is in pretty general use. They frequently agree with their masters to pay them an annual rent, or *obrok*, on condition of their being allowed to migrate to towns, and to carry on trades. Many of them have, in this way, acquired very great wealth.

3395. *The revenues* of Russia bear little proportion to the extent of her territory, her natural resources, or even her population. They arise from a capitation-tax of two rubles for each peasant, and five for each burgher; from which the nobles are nominally exempted, but they really pay it in the person of their slaves; a tax from merchants of $1\frac{3}{4}$ per cent. on their capital; custom-house duties on imported goods; stamps, coinage, postage: government assumes also the monopoly of distillation; and, in Siberia, the mines are wrought on its account, and the tribute of the subject races is paid in furs: but these last sources, subject to the usual mismanagement and corruption of the agents of an absolute government, produce probably very little. The total amount is supposed to be about 13,000,000*l.* sterling, burdened with a very large amount of debt; the greater part of which, being depreciated paper-money, fetters greatly the operations both of finance and commerce.

3396. *The military force* of Russia is the subject of anxiety and terror to Europe; and has, indeed, if official statements may be credited, attained to a most enormous amount. According to them, it rose, in 1820, to no less than 989,000 men, independent of the national guard. One simple fact may, perhaps, serve to refute this ridiculous statement, and tend to prevent Russia from overawing Europe by the immensity of her paper armies. When Bonaparte penetrated to Moscow, with 130,000 men, he outnumbered all the forces which Russia, in that utmost extremity, was able to bring against him. These were not estimated at much more than 90,000 men; some part of which was only half-armed militia. There might be 40,000 on the Turkish, and a few on the Persian, frontier; but, certainly, the utmost which Russia could summon, in that greatest need, was not more than 150,000; which the troops employed in garrison, in police service, and in guarding the Asiatic frontier, did not probably more than double. The real strength of the Russian army has always consisted, not in its numbers, but in the passive and iron valour of its infantry, and the rapid and skilful movements of its irregular cavalry; the Cossacks, the Baschkirs, and other Asiatic nomades. Its field artillery also has commanded the admiration of the best tacticians. It has been boasted, indeed, that the new military colonies, when brought into full operation, will afford a regular supply of three millions of recruits. They consist of the crown peasantry, in all about six millions, who are formed into villages, and subjected to strict military discipline. The head colonist, or farmer, receives fifty acres, and a neat house, burdened with the support of a soldier and his horse: these, when not at exercise, or called out into actual service, assist in his agricultural labours. By this means, in 1820, there were organised 48,000 troops in three hundred and eighty-four villages; and it was proposed gradually to extend the system. But, besides that these could never be more than an ill-disciplined militia, their increase is opposed by various obstacles. The crown peasants, whose servitude before was little more than nominal, grievously complain of the present rigorous coercion, and of the burden of supporting a soldier-servant, whose aid is very doubtful, and who is more likely to act as a master. It would be very difficult to ensure the submission of these armed colonists; and, at all events, the number who could be marched out of the empire would be limited by the narrow amount of the funds out of which they could be supported.

3397. *To render Russia a naval European power*, in which character she had no existence at the commencement of the last century, was the object of strenuous effort both to Peter and Catherine. A navy was accordingly created on the Baltic and Black Sea, which enabled Russia to become predominant in both. The great priority of importance, however, which late events have obliged her to attach to her army, has caused the sea service to fall into comparative neglect. In 1820, she possessed thirty-two ships of the line, eighteen frigates, and a quantity of small craft, but not in very perfect repair; and the number of men employed was between thirty and forty thousand.

SECT. V. *Productive Industry.*

3398. *The industry* of Russia is in a very unimproved state, owing to her long barbarism, the prevalence of slavery, and the thin population scattered over immense tracts of territory. These tracts, however, being in many parts of great natural fertility, yield a large amount of bulky and useful commodities, which can be exchanged for the delicate productions and fine manufactures of the south and the west.

3399. *The agriculture of Russia* is extremely rude, and can never make much progress while all the husbandmen are enslaved and depressed. In the interior the plough is a wretched instrument, which, dragged by one horse, merely scratches the surface; and the harrow is composed wholly of wood. In the south alone can the land be said to be really ploughed; and, even there, the rotation of crops is very little understood. Nevertheless, in every part of Russia there is a surplus of grain: in the north, chiefly of oats, with some rye and barley; in the south, of the very finest wheat, in such abundance as might render this the granary of the west. The plains of the interior, especially between Petersburg and Moscow, are covered with extensive forests; and all its villages, with the greater part of its cities, are built of wood. This, however, being chiefly pine, fir, and birch, is little adapted for ship-building or solid constructions; but numerous and large masts and deals are afforded for exportation. Cattle and sheep are reared in vast numbers, especially in the southern steppes; but little has yet been effected to improve the breeds: and the distance is such, that none of the animal products are exportable, except tallow, hides, horns, and bristles. Hemp and flax are cultivated very largely, and yield not only the material of the staple manufacture of the country, but a large surplus for exportation. Bees swarm throughout the empire, rendering honey and wax superabundant. Some wine is made in the provinces along the Black Sea, but it has not attained any high reputation. Since 1827, however, very great exertions have been made to extend its culture, by introducing plants both from Bordeaux and the Rhine; and the prospects of success are said to be promising. The minerals, which form so great a proportion of the wealth of Russia, are brought chiefly from Asia; for the European side of the Urals is by no means so rich as the other. The

same is decidedly the case with regard to its furs, the finest of which come from the remotest east of Siberia.

3400. *The manufactures of Russia*, notwithstanding the efforts made by government, continue still in a rude state. The most national of them are coarse fabrics from hemp and flax, sail-cloth, duck, sheeting, sackcloth; all of which are supplied by Russia, of better quality, and at a cheaper rate, than they can be had elsewhere. Government, also, by the high rewards with which they have allured foreign manufacturers, has succeeded in establishing extensive fabrics of iron and hardware, particularly of arms. The chief seat is at Tula, the manufactures of which are a subject of controversy. Mr. Tooke, and some foreign writers, represent their products as equalling the finest of Birmingham and Sheffield; while Dr. Clarke affirms that "the work is showy, but very bad, and the muskets are such only in name; missing fire five times out of six." This last assertion, however, carries absurdity on its face. Dr. Lyall seems, in this instance, to have fallen on the proper medium, in admitting that the articles cannot come into any sort of competition with English, but yet that many are showy and elegant, and that the muskets have done greatly too much execution to allow us to suppose them so extremely defective. Government has also been able to establish silk and cotton works in the two capitals, but not sufficient for internal supply. Coarse woollens, in great quantity, are articles of domestic manufacture for family use.

3401. *The commerce of Russia* is very considerable, in consequence of her large surplus of rude produce, and of the extensive wants which luxury has created, and which can only be supplied from abroad. The interior communications, from one end of the empire to the other, are of vast extent. The rivers which intersect its wide level plains are almost all navigable; and those which flow into the Baltic approach closely to others which direct their course to the Euxine and the Caspian; the Dwina to the Dnieper, and the Neva to the Volga. By a channel, also, which will be afterwards delineated, there is an almost continuous navigation, with short portages, across Siberia. Furs, gold, silver, iron, copper, of great amount and value, are brought from that part of the empire: in its extreme point, at Kiachta, the Chinese merchants meet the Russian; and from its border numerous caravans proceed into the interior of Tartary; while Persia is visited across the Caspian. The grand rendezvous of all these products is at the fair of Nizni Novogorod, in the south of Russia; which, both for the amount and variety of the articles produced in it, seems to be the very first in Europe. Here the sugar and coffee of the Indies, the wines of France, the cottons of Britain, meet the silks and teas of China, the furs of Yakutsk, and the gems of Bucharia. The quantity of goods sold at this fair amount, according to Klapproth, to ninety-four millions of rubles (about 15,000,000*l.* sterling); a sum which we cannot but think greatly exaggerated; and still less can we listen to Dr. Lyall and Captain Cochrane, who raise it to double the amount. The following quotations from Klapproth may give at least an idea of the proportion between the different articles. Furs, 5,000,000 rubles; teas, 12,000,000; silks, velvets, damask, &c., 23,500,000; woollen cloths, kerseymeres, &c., 7,300,000; muslins, and other cotton stuffs, 5,000,000; mixed silk and cotton, 2,500,000; raw cotton from Bucharia, 2,900,000; raw silk, 400,000; pearls, precious stones, shawls, &c., 1,280,000; arms and iron utensils from Tula, 540,000; the same from Siberia, 10,360,000; alum, vitriol, and other colouring substances, 3,600,000; porcelain, 525,000; crystals, 515,000. The foreign commerce of Russia is limited, by its holding only interior corners, as it were, of inland seas, the openings of which belong to powers independent, and liable to become hostile. Thus, the entrance of the Black Sea is possessed by its natural enemy the Turk; that of the Baltic may be shut by Britain, a precarious ally. When, however, the ports are not closed by war, the amount of the rude produce exported, and of the manufactures and luxuries of Western Europe imported, is very large. The amount stated for 1830 is 274,312,128 rubles exported, and 198,132,812 imported; but these are paper rubles, worth only about eleven pence. Exclusive of the above, the gold, silver, and bank-notes exported in 1830 were estimated at 5,033,452 rubles; while those imported were estimated at 71,097,160. Tallow is by far the most valuable article of export: the quantity exported in 1830 amounted to 4,091,544 poods (36 lbs. each); of which 3,223,434 poods were for England. The next great articles are flax and hemp, wheat, iron, timber, bristles, tar, &c. Colonial produce, particularly sugar, cotton twist, wine, dyewoods, silks, &c., form the principal articles of import. During the year 1830, 5690 ships entered the different ports of the Russian empire, exclusive of those on the Caspian Sea: of these, 1681 ships were from Great Britain, 1623 from Turkey, 513 from Holland, 384 from the Hanse Towns, &c. During the same year, 5907 ships cleared out from the different Russian ports: of these, 1637 were bound for Great Britain, 312 for Turkey, 501 for Holland, 415 for the Hanse Towns, &c.

3402. *The canal navigation of Russia*, so far as it has hitherto been carried, has been exclusively the work of government. The grand object was to connect the Baltic with the Volga, and thus make it communicate with the Caspian, and form a continuous navigation across the whole empire. This was effected by joining the Twertza, a tributary of the Volga, to the Mtsa, which falls into the Lake Ilmen, whence, by the Volkof, the Lake Ladoga,

and the Neva, there is a navigable line to Petersburg. The steep descent of the river Mtsa, however, presented a difficulty which even Peter could overcome only by a peculiar process. Water sufficient can be collected only once in eight or ten days, and all the vessels assembled in the course of that time are summoned, by beat of drum, and shoot down, one after the other. In proceeding along the Mtsa, for 33 versts, they have successive difficulties to encounter; and, as they cannot reascend these steeps, they are broken up for firewood. At Petersburg the canal navigation of Russia had fallen into considerable neglect, till 1817, when Alexander provided funds, amounting to 5,000,000 rubles, to be applied to its improvement. He created an office of "director-general of the ways of communication," including canals, roads, and bridges. The Duke of Wirtemberg, who was appointed to this situation, made a general survey, and found extensive repairs and improvements necessary, particularly in the above-mentioned grand line of communication. Great exertions were requisite to supply with water the scanty streams by which it was maintained. One of the principal improvements was the union of the lake Schlino to that of Velio; an undertaking begun in 1778, and carried on with much fruitless expense, but completed in 1825. By this supply, and those drawn from other quarters, the navigation was so much improved, that, in 1826, a caravan, as it is called, of 1000 barks ascended without meeting with a single accident. Great improvements were also made in the canal of Ladoga, though it is still liable to want of water in dry seasons; but, in 1826, when this deficiency was felt, the Duke, by powerful steam-engines, poured into it the waters of the Volkof and of Lake Ladoga, and thus enabled the barks to proceed.

3403. *The canal of Lias*, commenced in 1802, and finished in 1814, joins the Tikhvine, which falls into Lake Ladoga, to the Lias, a tributary of the Mologa, which falls into the Volga. This line is navigable only for boats of about 20 tons; but it has the advantage over the other of being passable in both directions, and hence is extensively employed in the conveyance of goods from Petersburg to the interior.

3404. *The line of Maria* is formed by the union of the Konja with the Vitegra, by which the Volga is connected with the Bieloe, or White Lake: hence by the Chicksna, the lake Onega, and the Suir, barks reach the Ladoga. This affords a good navigable channel, but it forms a circuitous route for Moscow and the interior provinces, and serves chiefly for conveying to the capital the products of Siberia.

3405. *The following is a view of the navigation on these three great lines, and its value in rubles in the year 1828:—*

	Crown Property.	Private Property.	Total.
<i>To Petersburg.</i>			
By the Vichnei Volotchok, barks - - - 8,916 }	22,148,000	81,386,000	103,534,000
rafts - - - 1,378 }			
Tikhvine - barks - - - 2,091 }	651,000	14,849,000	15,500,000
rafts - - - 1,448 }			
Line of Maria - barks - - - 2,431 }	3,015,000	9,857,000	12,872,000
rafts - - - 5,562 }			
<i>From Petersburg.</i>			
By the Vichnei Volotchok barks - - - 2,411		1,160,000	1,160,000
Tikhvine - - - - - 1,520		18,179,000	18,179,000
Maria - - - - - 1,358		784,000	784,000

Other important undertakings. — the junction of the Markta and the Volga, the Oka and the Don, the Priepicz, the Niemen, and the Bog, the improvement of the navigation of the Dnieper, — have been projected, and some of them are in an advanced state.

3406. *The roads of Russia* are not in general good; yet the level nature of the country, the abundance of timber and cattle, enable the numerous caravans to move at a very cheap rate. The high road from Petersburg to Moscow is a very remarkable work. It is an elevated causeway of timber, carried in one long, level, unvarying, straight line over marsh and bog, and through thick forests of birch and fir. Being composed, however, only of round trunks of trees, often ill joined together, it is in many places exceedingly rough.

SECT. VI. *Civil and Social State.*

3407. *The population of Russia*, which, in 1722, was rated, probably too low, at 14,000,000, had risen, in 1762, to 20,000,000; in 1795, to 36,000,000; in 1818, to 45,500,000; and, in 1824, to 50,000,000. But this increase, independent of probable omissions in taking the census, arises in a great measure from the extensive conquests effected during the lapse of this century; the Crimea, the Caucasus, more than half of Poland, and the whole of Finland, have augmented by nearly one half the mass of the empire as it existed in 1722. The last increase of 4,500,000, between 1818 and 1824, may be considered as exhibiting the natural progress of population, somewhat aided by emigration from the poorer districts of Germany. It gives a rate of one tenth in six years; and a duplication in sixty years; which, however,

affords little support to the anticipation of M. Stchekaloff, that Russia, in 1892, will contain 230,000,000. There is no doubt that she has natural capacities enabling her to reach that number; but heavy chains weigh on her productive industry, which may not be broken for several ages.

3408. *Of these 50,000,000, European Russia contains only 34,000,000: about 11,000,000 belong to the acquisitions in Poland, and the remainder to Asiatic Russia.* The basis of this great population is entirely Slavonic; a race distinguished by a peculiar language; by a patient, hardy, obstinate, and enduring character; by a very limited extent of intellectual culture, and of the characteristics which raise man above the brute. This last deficiency, however, we should be very little disposed to regard as the fixed doom of any particular race of men. It appears the consequence of long ages of bondage and oppression, and of the insulated position of this people in the heart of these immense steppes and deserts; removed from all the impulses which have rendered the western nations so enlightened and energetic. There are about 3,000,000 of the Finnish race, occupying the acquired provinces of Livonia, Esthonia, and Finland, the shores of the Northern Ocean, and some tracts along the borders of Asia. Tartars also inhabit the Crimea, and have penetrated into some of the southern steppes. The great body of the nation is divided, without medium or gradation, into the distant classes of nobles and slaves. The few who struggle between these opposite extremes are insulated and unprotected individuals, who can scarcely attain a place or character in society.

3409. *The nobles* are the body chiefly acted upon by that forced and imported civilisation, by which Peter sought to convert the nation at once from the depth of barbarism to the highest pitch of refinement. In fact, as to outward aspect and manners, this body, especially that great proportion who have travelled, are scarcely to be distinguished from the most brilliant society of the western courts; and among the number are included many well-informed, intelligent, and liberal individuals. Their cultivation, both as to manners and intellect, is principally derived from France, whose language is almost exclusively spoken at court, and whose writers alone are generally read; but the gay polish of French manners harmonises ill with the remnants of Muscovite rudeness. Many of the nobles boast a high descent, tracing their origin even to Ruric; a claim not admitted by the court, which studies to merge all distinction in military rank, real or fictitious. Their fortunes are in some cases truly enormous, especially when compared with the cheapness of provisions. The head of the Scheremetov family, reckoned the richest, is said to have 125,000 slaves, estimated at 150 rubles each. The nobles generally spend these estates in profuse and ostentatious hospitality; combining, though not very tastefully, the open house of the feudal baron with the elegance and splendour of Parisian luxury. Dr. Clarke and Dr. Lyall remark a feature which belongs to the dark ages of our own civilisation. The gradations of rank are observed not only in the places assigned at these long tables, but in the viands placed before them; so that, while the guests near the master of the house are regaled on sturgeon and champagne, those towards the lower end partake of *sauer kraut* and black cabbage broth; nor can a guest, without the violation of all propriety, solicit food that does not belong to his station. An immense household of servants, amounting in country residences not unfrequently to 500 or 600, and an extraordinary profusion of silver plate, are the two reigning points of magnificence; but, unluckily, these luxuries are often alloyed by some failure as to cleanliness, both of person, furniture, and dishes. What is worse, an absence is in many instances observable of that nice sense of honour which forms the pride of our aristocracy. It was under Peter I. that Prince Menzikoff and the governor of Ingria were whipped for peculation; but it is said that the difficulties in which the profuse expenditure of the Russian nobles often involves them, are still sometimes met by expedients which we should consider as quite incompatible with the character of a gentleman. However, they have entirely renounced the national habits of intoxication, originally so strong, that Peter the Great deemed it necessary to prohibit ladies from getting drunk at a ball, but durst only fix for gentlemen a limitation as to time. We wish it could be added that ladies of rank were equally distinguished for their domestic and conjugal virtues; of which, indeed, some bright examples may be found; but the French modes of life, and the dreadful examples set by Elizabeth, Catherine, and other empresses, have found but too many imitators, and have rendered manners, in this respect, looser than in any other European court.

3410. *The slaves*, the other dire extreme of Russian society, form still the great mass of the people. In 1816, the peasants of the crown amounted to 6,353,000; those of private individuals to 9,757,000; in all, 16,110,000. This ill-fated class is divested of every right, political and personal, scarcely excepting that of life. The master has the full power of the scourge, which is liberally exercised, and of every other corporal punishment which does not produce death in twenty-four hours. There is, indeed, a law by which the master may, in that case, be brought to justice; and there are marshal's courts, to which, in certain cases, the slave may appeal; but these means of redress are practically very precarious. The crown has done every thing in its power to forward emancipation; but as it never has ventured

upon compulsory statutes, and as the nobility remain rootedly attached to the *good old* system, little impression has been made on the great mass of bondage. The slaves, however, are not so severely oppressed as in the West Indies. They are not under the daily whip of a taskmaster. The cultivating peasant has a spot of land, for which he pays *obrok* or rent, which is apt, indeed, to be unreasonably screwed up by a necessitous landlord; but otherwise he labours and earns for himself. Some villages have even raised large sums to relieve an esteemed master from the pressure of necessities which would have obliged him to sell his estate, and transfer them to another proprietor. Those who, on payment of personal *obrok*, practise trades in cities, often attain to opulence; a slave of Count Scheremetov is mentioned as carrying on a manufactory that employed 4000 persons; and a slave of Count Strogonov constructed the Kasan church, the finest in the capital. Still all the profits earned by the slave belong by law to the master; but public opinion has established such a bar against his taking more than a proportion, that it happens only in a very few instances. A certain moral degradation is almost inevitably entailed on their unfortunate destiny. A profound craft, a sulky obstinacy, a studious concealment of every quality and possession of which their master could avail himself, are habits natural to the slave. He shows, however, a stubborn acquiescence, which somewhat resembles contentment; an untameable passive courage, and a constant thoughtless cheerfulness and good-humour. The Russian slaves have a surprising talent at imitation, common among enslaved and uncultivated minds. The master distributes household employments among numerous slaves, without any consideration of natural talent, or almost any instruction, except the cudgel; yet the functions of each are executed with a surprising degree of correctness. From the period of their subjection by the Tartars, they have retained some oriental habits; of these the most remarkable is the use of the vapour bath, which, under some form, is a necessary appendage to every village, even under the frozen climate of Archangel. It is considered as equally conducive to pleasure and to health; and even in the farthest north, the delight of the bathers is to come out reeking hot, and roll themselves in the snow; which process, instead of killing them, as might be expected, is said materially to invigorate the frame.

3411. *The religion of Russia*, so far as relates to establishment, is that of the Greek church, which is professed with many superstitious observances. The worship of images is carried to a great extent, though the letter of the scriptural prohibition is sought to be evaded by having only the drapery in relief, and the face flat and painted. With these representations, not only the churches are filled, but every serf has one in his cottage, to which he pays sundry and uncouth acts of obeisance. Fasts are frequent, long, and rigidly observed; but at the festivals they indemnify themselves by an excess of eating, which not unfrequently proves fatal. In no cities, perhaps, are religious ceremonies and processions celebrated with such pomp as at Petersburg and Moscow. The long trains and gorgeous robes of the priests, the glittering insignia waved over them, the blaze of thousands of tapers, and the innumerable crowds of assembled devotees, are said to eclipse every scene of similar splendour in Spain and Italy. The festival of the Resurrection is the most splendid; and next to it those on the two, certainly natural, occasions, the breaking of the ice on the Neva, and the first

456

RUSSIAN PATRIARCH

springing up of verdure from the long-frozen earth. Russia had once a patriarch (*fig. 456.*), almost equal in power to the Catholic pope: but Peter, jealous of his functions, assumed them to himself; and his successors have ever since exercised them. The parish priests have slender incomes, eked out by fees: they are ignorant, vulgar, and belong almost to the lowest class of society. They amuse the people with shows and observances, but seem scarcely capable of communicating to them any moral or spiritual ideas. Instead, however, of being bound to celibacy, they are laid under an obligation to marry; in the hope, it is said, of rendering their conduct more regular, but without always securing that result. The higher orders of clergy are all monks, well endowed, living usually retired and regular lives, and often possessed of considerable learning; but they come little in contact with the body of the nation. Of these there are thirty-three bishops and archbishops. The secular clergy have been estimated at 160,000, and their places of worship at 70,000. There are 480 monasteries, and 156 nunneries. The Lutherans, estimated at about 2,500,000, are nearly confined to Finland and Livonia. The Crimea, and some other southern districts, are Mahometan. The Catholics and Unitarian Greeks are nearly confined to the Polish provinces. The Russian government professes, and generally administers, an absolute toleration, and even equality of rights among the different religious professions: yet the caprice of despotism sometimes issues very tyrannical mandates. Such was the recent one, prohibiting the Jews from exercising any of the trades by which they have hitherto gained a subsistence, and enjoining them to apply solely to agriculture, which they had always shunned; and another, by which they were banished from both the capitals.

3412. *The introduction of literature* has been an object of anxious concern to the Russian monarchs, who have yet been able to illuminate only partially the night of ignorance in which their vast empire is plunged. The chief scientific glory of Russia arises from the names of Pallas, Gmelin, Euler, Bernoulli, and other German savans, whom the bounty of Catherine induced to form either a permanent, or at least a temporary, residence at Petersburg. French literature, however, has always been the most fashionable in the higher Russian circles; though, with the two exceptions of Grimm and La Harpe, the French savans have in vain been invited to exchange the delights of Paris for the frozen splendour of the northern capital. The Russian is beginning to be a written language: there are said to be now 8000 works printed in it, which, however, is not very much more than the number annually published in Germany. Lomonosoff and Sumorokoff rank as the greatest Russian poets; and Karamsin, by his writings in different branches of the belles lettres, has of late drawn attention even beyond Russia.

3413. *The public establishments for science* in Russia are highly endowed and patronised. The Academy of Sciences, planned by Peter the Great, was founded by Catherine I., who assigned to it a revenue of 5000*l.* The society was regulated by the advice of Wolf and Leibnitz; and several of the greatest modern names have adorned its annals. Gmelin, Pallas, and others of its members, have been employed, at great expense, in exploring the most distant provinces. The Academy of Arts was founded by Elizabeth, but enlarged by Catherine II., who allowed it 12,000*l.* of annual revenue, to be employed in supporting 300 pupils, and in procuring the best models of every kind. The library has never become very extensive, but is rendered curious by the ancient manuscript chronicles; and by a collection of Chinese works, amounting to 2800. The museum has many interesting and peculiar features derived from the mineral products of the empire, particularly a vast mass of native iron found in Siberia, fossil remains of the mammoth and other gigantic animals; the dresses, arms, and implements of the rude nations of Siberia and Tartary; the ornaments found in the tombs of the Altaï. The imperial library is also extensive; and a fine cabinet of paintings has been formed by the purchase of the Crozat collection, the Houghton, formed by Sir Robert Walpole, and others of inferior magnitude. The university of Petersburg was founded in 1804, by the emperor Alexander, and endowed with an income of 130,000 rubles.

3414. *The Russian habitations*, so far as relates to the palaces of the nobility, and to the public buildings, which are all erected by the crown, are formed on the model of the rest of Europe, and display a magnificence elsewhere unrivalled. All the others (*fig. 457.*) are

457

RUSSIAN VILLAGE.

miserable in the extreme, calling to mind the first rude efforts of man after he came out from the hollow of the oak. They consist merely of the trunks of trees, not even formed into logs, the interstices filled with moss and clay, and the light usually admitted by square open crannies: thus they resemble casual piles of timber rather than human dwellings. Hence the chronicles

use the expression "cutting a town," because the felling of the timber is the only arduous part of the process.

3415. *The national amusements* are chiefly those afforded by the ice; for here, as all over the North, the gayest season is when its impenetrable surface covers all the earth and the waters. The Neva is entirely occupied by parties skating, running sledge-races, and enjoying other sports of the season. A favourite diversion is afforded by the ice-hills, on whose sides are formed steep inclined planes, down which the adventurer throws himself, seated on a machine which he guides with surprising skill. Swinging is another Russian diversion; to which may be added the common ones of dancing, and of a national music, which, with the songs and ballads to which it is sung, is very plaintive and pleasing.

3416. *The national dress* of Russia consists of a long coat reaching to the calves of the legs, with numerous tucks at the bottom of the waist; a vest of coloured linen, leaving the neck bare; thin boots, or shoes, of the bark of the linden. In winter, a sheepskin pelisse is substituted for the coat. The dress of the higher ranks is now formed studiously on the European model, though no other part of Europe can rival the gorgeous robes worn by the nobles and bishops on public occasions, or the profusion of diamonds which covers their persons, making them appear all in a blaze.

3417. *The staple food of the Russian peasants* consists of black rye bread and cabbage broth, thickened with oatmeal, which Dr. Clarke mentions with horror, but which, according to Dr. Lyall, may be made far from unpalatable; sometimes salted or frozen fish. The standing drink is their favourite *quass*, made by pouring warm water on rye or barley-meal. The rich cover their tables profusely with French wines and the most delicate dishes, among which sterlet from the Volga, and veal from Archangel, are highly valued. The preliminary use of salt fish, cheese, and brandy, as a whet, is as general here as in Scandinavia.

SECT. VII. *Local Geography.*

Synoptical Table of the different Governments of Russia in Europe; their Extent, Population, principal Towns, &c.

Designations.	Square German Miles, 15 to a Degree: about 22 English.	Population.	Population to Square Mile.	Population of Principal Towns in 1832.

3418. *The grand local division of Russia* is into provinces, and these into governments. The provinces, equal in extent to great kingdoms, are, the East Sea Provinces, Great Russia, South Russia, and the kingdom of Kasan. This last has of late been often considered as Asiatic; yet the character of the country, and the natural boundaries, lead us to agree with Arrowsmith, who, in his last Atlas, has made it European. West Russia, and the kingdom of Poland, belong to Poland.

3419. *The East Sea Province* forms no part of the original domain of Muscovy. It consists of provinces conquered chiefly from Sweden. Ingria (now Petersburg), Livonia, and Esthonia were wrested by Peter from Charles XII. at the unfortunate conclusion of his adventurous career; Finland, by Alexander, during his unjust invasion in the last war; Courland from Poland, previous to the partition. These provinces form a flat dreary country, buried in snow during half the year, covered with gloomy forests of birch and pine, and yielding only in favourable spots the coarser kinds of grain, oats and rye. Yet, from the moment of their acquisition, they were considered the brightest jewel in the Russian crown. They opened to Russia, for the first time, a direct maritime communication with the civilised world. To it, therefore, the seat of government was immediately transferred: it became the centre of commerce; and within its precincts Peter erected his new capital.

3420. *Petersburg* (*fig. 458.*), the entire creation of its great founder, is built altogether upon a plain; and is the most regular, and, in appearance, the most splendid, capital in the world. It has no old, dirty, irregular quarter, abandoned to traffic, and shunned by all the opulent and refined; no straggling suburbs. It is "a city of new palaces;" wanting thus, however, the solemn and venerable effect produced by structures that belong to a former age. Except, too, a few of the palaces and public edifices, which are of marble and granite, it is built of brick, covered with a plaster resembling stone, but which can never have its rich and substantial effect. Petersburg is built entirely amid the waters; it occupies the south

and north banks of the Neva, comprising several large islands enclosed by its channel. The ground on which it stands being almost on a level with the river, it is exposed to a dreadful

458

PETERSBURG.

danger,—that of inundation. When a strong and continued west wind blows in the waters of the Gulf of Finland, the Neva rises sometimes eight feet, and overflows the whole city. It was supposed that the raising of the ground, and various precautions, had diminished the hazard of this calamity; but it took place, in 1824, on a more awful scale than ever. For two days Petersburg and its neighbourhood were covered as with a sea, in which waggons, furniture, boats, provisions, even wooden houses and coffins, floated in confused masses. Eight thousand people were supposed to have perished, and the destruction of property was immense.

3421. *The streets and edifices* are divided into several compartments, separated from each other by the interposed channels of the Neva. The principal is what is called the Admiralty quarter. It is situated along the south bank of the Neva, which, here forming a species of elbow, converts the quarter, as it were, into a large triangle. It is faced towards the river by a most magnificent granite quay, extending three miles in length. Here are grouped all the most magnificent structures of Petersburg, which resemble a vast range of palaces; and, to those who enter from the desert country around, produce the effect of enchantment. The Admiralty itself, a quarter of a mile in length, presents, perhaps, the longest façade in Europe, richly ornamented, though not, throughout, in the purest taste. Three broad and fine streets, about two miles long, branch from this central edifice, which terminates the vista of each. The grandest structure, however, is the imperial winter palace, 450 feet long, 380 broad, and which, with an adjoining wing called the Hermitage, contains the most valuable of the imperial collections. On a smaller scale, but of still richer materials, is the marble palace, resting on a basement of granite, and roofed with copper. The new bank is also considered one of the chief ornaments of Petersburg.

CATHEDRAL CHURCH, PETERSBURG.

But the greatest of all is the cathedral church of Kasan (*fig. 459.*), in the second Admiralty quarter, one of the most splendid structures that modern art has produced. It was begun in 1800, and finished in fifteen years, at an expense of 15,000,000 rubles. The design, though good, was not the very best that was presented; but being the production of a Russian slave, feelings of patriotism caused it to be preferred. It was executed entirely by Russian workmen, and of materials which, though of the richest description, were all furnished within the empire. The cupola is criticised as too small, and some other defects are pointed out; but the forest of 150 columns in front combines, with its splendour, a purity of taste, which could scarcely have been expected from a semi-barbarian artist. All the materials and ornaments are of the richest description. In the same quarter is the colossal equestrian statue of Peter the Great, chiefly remarkable for the mass of black marble on which it is placed, weighing 1500 tons, and in this respect incomparable. The Vasili Ostrov (Basil's Island) is the chief insular compartment, containing the custom-house, exchange, and other establishments for commerce; and, by a singular combination, the academies of science and art. The island which bears the name of St. Petersburg, and the quarter of Wiborg, on the northern bank, include the remains of what was the original city, or rather village, with large additions, but still retaining more of a rural character than the rest. The Foundry quarter is distinguished by the large establishments bearing its name, but still more by a very superb structure of Catherine, called the Taurida palace. At the end of a vestibule and hall, both of immense extent, and adorned with vast ranges of columns, statues, and vases, appear gardens which, in winter, while all the world without

is buried in ice and snow, present the most brilliant hues of summer. Being enclosed in a spacious saloon, they may be considered as a vast conservatory. The islands and opposite banks of the Neva are connected only by pontoons, or bridges of boats, which, on the approach of ice, are removed in two or three hours; and the ice then supersedes every other bridge. Mr. Coxe saw a magnificent design, by a Russian, of a wooden bridge with a single arch, to span the breadth of 1000 feet; but it has never been executed. The population of Petersburg amounted, according to the Gazette, in May, 1829, to 425,000, including military. In 1764 it was only 164,000. Of these, only about 340,000 are stationary; as 55,000 belong to the naval and military services, and 25,000 are foreigners. The original Finnish inhabitants do not now exceed 40,000. The ground in the vicinity being barren, the city is supplied from a great distance; with cattle from the Ukraine; grain, and even timber fuel, from the provinces on the Volga; yet the sure demand produces a steady supply. Petersburg is a place of very great trade. The value of the imports, in 1830, amounted to 145,000,000 rubles, and of the exports to 111,000,000 ditto. During the same year, 1483 ships cleared out from Petersburg, of which 753 were British. Most part of the foreign trade of Russia is in the hands of foreign merchants, of whom the English are the principal. For details as to the commerce of Petersburg, see M'Culloch's *Dictionary of Commerce*.

3422. *Among the environs of Petersburg* we may mention the palaces of Oranienbaum, Peterhoff, and Czarskoje-Selo; which are merely spacious country-houses, with agreeable gardens in the English style attached to them. A much more important object is Cronstadt, at the mouth of the Neva, the grand naval arsenal of the empire. The fortifications on the sea-side are very strong; and form, indeed, the only defence of the capital, which, towards the land, is almost quite open. The docks are extensive and commodious; and the largest, alone, of the three harbours, will contain 600 sail. Although Russia be considered so great a magazine of naval stores, the construction of ships of war is by no means very cheap, as the northern provinces produce only fir, and oak must be brought from Kasan, on the borders of Asia. The population of Cronstadt is about 40,000.

3423. *The provinces on the southern coast of the Gulf of Finland* are flat, interspersed with lakes and marshes; but they contain many fertile tracts, which, if better cultivated, might yield plentifully the hardy kinds of grain, rye, barley, and oats. They were acquired in the thirteenth and fourteenth centuries by the Teutonic knights; and the higher and ruling population thenceforth became German; while the Fins, the natives, were reduced to the state of vassalage, in which they still remain. They were then successively conquered by Sweden, Poland, and Russia. The nobility still enjoy some privileges, and meet in provincial states; but the peasantry are oppressed, notwithstanding efforts made by the Russian government for their relief. Riga, the capital of Courland, is one of the greatest emporia of the North. The imports, in 1828, are said to have amounted to 15,599,000 rubles; the exports, to 38,826,000 rubles: the number of ships which entered was 1162; those which went out, 1180. More than two thirds of its trade is with England, the rest chiefly with Holland and Denmark. Riga is very much a German town, neat and well built, without any remarkable features. There are some scientific establishments. Dorpat is an agreeable town, situated in the best part of Livonia, having a pretty brisk inland trade, and being, since 1802, the seat of a well-endowed university. Revel, the capital of Esthonia, is an old irregular town, tolerably fortified, and with an excellent harbour, where there is some trade in the usual Russian staples. Narva, a neat German-looking place, formerly belonging to the Hanse Confederacy, and still retaining some trade, is chiefly distinguished for the signal, though ultimately fruitless, victory here gained by Charles XII. over his great rival.

3424. *Finland*, a recent ill-acquired possession, seems now finally united to the Russian empire. The Fins are still attached to Sweden; but, being well treated, their trade protected, and their national customs respected, they acquiesce with tolerable patience. The country is almost a counterpart of Sweden; "a succession of hill and dale, abounding in forests of fir and beech, interspersed with numerous lakes, and thickly overspread with shattered fragments of granite." During the winter it is covered with a hard uniform surface of snow and ice, in which the roads are marked by boughs of fir laid along them. The Gulf of Bothnia, between Finland and Sweden, is then entirely frozen over, and sledges drive across it, beating for themselves a smooth and hard road, which is only a little dangerous at the commencement and close of the season. The Fins are a race by themselves, and speak a language which is quite distinct from that of any of their neighbours, and seems to be in its origin Asiatic. They are on the whole a patient, laborious, well-disposed people.

3425. *Abo*, the capital, is situated on the promontory which connects the Gulfs of Bothnia and Finland; a fortunate position, which enables it to carry on all the trade of the country. The university is also considerable, having been greatly improved by Alexander. The professors, eighteen in number, have each a salary of 4000 rubles, besides fees from the students, who are numerous; as a certain attendance is required to qualify for any office under government. This city, however, has been laid waste by a recent fire, which has consumed the university, its museum, and library, and many other public edifices. Helsingfors contains a naval arsenal of some magnitude, but is chiefly important from the vicinity of Sweaborg, the northern Gibraltar. This fortress is composed of three islands, united to each other by bridges; the works are partly blasted from the rock, and partly built of the granite which composes it. They mount upwards of 800 pieces of cannon, and can accommodate 12,000 men; while a well, sunk in the rock, secures it against any danger from the want of water. All these advantages of nature and art have been fruitless; and Sweaborg, on each occasion, when it ought to have been the bulwark of Finland, was surrendered by treachery. Wiborg, the capital of all that part of Finland which Peter the Great rendered Russian, and of all that region before Petersburg existed, presents some marks of former splendour. Tavasthus is a rude wooden town, forming a sort of capital of the wide marshy plains of interior Finland.

3426. *Great Russia* is the most extensive of all the divisions of the empire. It forms the great interior mass of what was the original Muscovy, and presents the native race and habits in their utmost purity. The northern part corresponds to Sweden and Lapland; it is hilly, and wooded; and though covered during more than half the year with snow, yet in its better tracts it produces oats, even beyond its own consumption. The middle region forms an expansive well-watered plain, abounding, though in a somewhat rough shape, with corn, cattle, timber, and all the necessities of life.

3427. *Moscow* (*fig. 460.*), the ancient and interior capital, is, perhaps, the most extraordinary city that exists, either in Europe or Asia. It presents a singular combination of

460

MOSCOW.

whatever is most striking in both continents. It surpasses in splendour the greatest capitals of Europe, and in poverty its poorest villages. According to the happy image of the Prince de Ligne, "it looks exactly as if some 400 old castles of the nobles had been transported thither, each bringing its little attendant village of wooden cottages. Wretched hovels are blended with large palaces; cottages of one story stand next to the most superb and stately mansions; many brick structures are covered with wooden tops; some of the wooden houses are painted; others have iron doors and roofs."—"One might imagine," says Dr. Clarke, "that all the states of Europe and Asia had sent a building by way of representative to Moscow: timber huts from regions beyond the Arctic; plastered palaces from Sweden and Denmark; painted walls from the Tyrol; mosques from Constantinople; Tartar temples from Bucharra; pagodas, pavilions, and verandas from China; cabarets from Spain; dungeons, prisons, and public offices from France; architectural ruins from Rome; terraces and trellises from Naples; and warehouses from Wapping. Some parts have the appearance of a sequestered desert, and the traveller is tempted to ask, Where is Moscow? till he is told, This is Moscow." "Here are seen," according to Dr. Clarke, "wide and scattered suburbs, huts, gardens, pigsties, brick walls, churches, dunghills, palaces, timber-yards, warehouses; and a refuse, as it were, of materials sufficient to stock an empire. In other quarters the throng is so immense, that the traveller asks, What cause has convened such a multitude? and learns that it is the same every day. At some points, and particularly from the Kremlin, where all its deformed features are hidden, and the eye roves over the towers, domes, and spires of its gorgeous temples and palaces, Moscow presents an aspect of rude and varied magnificence, which scarcely any other capital can equal."

3428. *The sumptuous edifices of Moscow are very numerous*, as, notwithstanding the transference of the government to Petersburg, the greater number of the nobles still make it their residence. Many of their palaces are, or were, truly magnificent; that of the Pascof

461

THE KREMLIN.

family, perhaps, the most strikingly so. The Kremlin (*fig. 461.*), however, is the most extraordinary of all the edifices of this extraordinary city. It is a sort of enclosed town, which, besides the ancient palace of the czars, contains the two magnificent churches of St. Nicholas and the Assumption, numerous chapels, government offices, houses of the priests and other public functionaries. Its original style and pavilion-like aspect are decidedly Asiatic; yet there are extensive portions constructed in the Grecian style. "Here a pagoda, there an arcade. In some parts richness, and even elegance; in others barbarism and decay. It is a jumble of magnificence and ruin; old buildings repaired, and modern structures not completed; half-open vaults, and mouldering walls, and empty caves, amid whitewashed brick buildings, and towers and churches with glittering, gilded, or painted domes." A Russian artist presented to Catherine a most superb model, which, at the expense of 7,000,000*l.* or 8,000,000*l.* sterling, would have harmonised the whole into one palace, the most magnificent in the world; but very small progress was made in the execution. Among the wonders of Moscow is the greatest bell (*fig. 462.*) in the world; 67 feet in circumference, weighing more than 22,000 tons, and worth about 70,000*l.*; but no intention of ever suspending it seems to be entertained. Another wonder is, the great gun, in which a man may sit upright; but from which not a shot was ever fired. The Church of St. Basil (*fig. 463.*) is, perhaps, the most curious of all the structures, from the completely Tartar style of its numerous and heavy cupolas, surmounted with gilded crucifixes. It is a work of piety for individuals to bestow large sums to gild or paint one of the numberless domes

of the churches, each according to his peculiar taste; whence arises a brilliant and fantastic variety.

462

GREAT BELL OF MOSCOW.

French. When Mr. James visited the city, in 1814, the whole space of 25 miles' circumference presented the most gloomy aspect of desolation. "A few shops and inns had been built, and looked like spots in the wide waste; but to repair the mansions of the grandees

463

CHURCH OF ST. BASIL.

was too gigantic a work to be then even begun; and they stood in the most neglected and forlorn condition. Street after street appeared in utter ruin: disjointed columns, mutilated porticoes, broken cupolas, walls of rugged stucco, black, discoloured with the scorchings of fire, and open on every side to the weather, formed a hideous contrast with the glowing pictures which travellers had drawn of the grand and sumptuous palaces of Moscow." (fig. 464.) In 1823, however, Dr. Lyall and Captain Cochrane found the work of reparation far advanced; and the new streets and edifices were constructed in a more regular style, though Moscow appeared still to Captain Cochrane, as in Clarke's time, "beautiful and rich, magnificent and mean." According to a work published in 1824, at Moscow, by M. Lecointe, 6341 houses had been burned, and 8027 had been rebuilt; so that it was larger than before; and Captain Frankland, in his recent journey, confirms this observation. On the Sparrowhill, Alexander, in 1817, laid the foundation of "a Temple of our Saviour,"

464

RUINED PALACES IN MOSCOW.

which, if completed, will be the most gigantic structure in the universe. It is to be 770 feet high (the Great Pyramid is only 630), having three successive churches rising above each other, the lowest of which was to be fronted by a colonnade 2100 feet long. Twenty-four thousand peasants were provided, of whom 6000 were to work at the building, and the rest to till the ground for their support. The work, however, had not been seriously begun till 1824. According to Lecointe, Moscow contains 14,724 nobles, 3101 crown servants, 4383 ecclesiastics, 12,104 merchants, 28,029 citizens, 10,384 artisans, 22,194 military, 1854 manufacturers, 1882 coachmen, 53,541 domestic servants, 72,758 peasants, 19,204 persons of various denominations, 2385 foreigners; in all, 240,000.

3430. Among the other cities, the first place, on account of its mighty name, must be given to the Great Novogorod (fig. 465.). Few objects convey more melancholy impressions of fallen grandeur than the view of this

3429. The story of Moscow has been singularly eventful. She has passed through almost unparalleled vicissitudes of war and devastation; but her recent scenes of glory and calamity have surpassed all those which preceded. The burning of Moscow is well remembered as the marking event, which turned against the all-grasping usurper the tide of fortune. Napoleon, when he entered Moscow, did not find it burning. The Russians, in retiring, left merely the combustible materials deep lodged, and sure to break forth. The flames soon appeared, and, aided by strong winds from opposite quarters, gained hourly new strength, till they wrapped that vast capital in one blaze of fire. Its proud and gilded domes either fell to the ground, or stood solitary amid surrounding ruin. The city thus rendered untenable, Napoleon was forced to commence that retreat, in which a great part of his army perished. It is remarkable that the Russian government still renounce the glory of this sublime sacrifice, and represent Moscow as burned by the

French. When Mr. James visited the city, in 1814, the whole space of 25 miles' circumference presented the most gloomy aspect of desolation. "A few shops and inns had been built, and looked like spots in the wide waste; but to repair the mansions of the grandees

was too gigantic a work to be then even begun; and they stood in the most neglected and forlorn condition. Street after street appeared in utter ruin: disjointed columns, mutilated porticoes, broken cupolas, walls of rugged stucco, black, discoloured with the scorchings of fire, and open on every side to the weather, formed a hideous contrast with the glowing pictures which travellers had drawn of the grand and sumptuous palaces of Moscow." (fig. 464.) In 1823, however, Dr. Lyall and Captain Cochrane found the work of reparation far advanced; and the new streets and edifices were constructed in a more regular style, though Moscow appeared still to Captain Cochrane, as in Clarke's time, "beautiful and rich, magnificent and mean." According to a work published in 1824, at Moscow, by M. Lecointe, 6341 houses had been burned, and 8027 had been rebuilt; so that it was larger than before; and Captain Frankland, in his recent journey, confirms this observation. once proud capital of the North. First the metropolis of Rurick, it became afterwards an independent republic, which, repelling Tartar invasion, held wide sway over the regions round the Baltic, and, uniting itself to the

465

GROUND PLAN OF NOVOGOROD.

magnificent cathedral. Murom, in its vicinity, is now a larger town; and in the forest which surrounds it are the extensive ironworks of Vixa. Tver is a well built, industrious city, grandly situated on the lofty banks of the Volga. In its district is Vichney Voloshok, near which is the remarkable canal connecting that river with the Baltic. In the south is Tula, already mentioned as the main seat of the iron manufacture, which has raised it rapidly to be a large, thriving, and busy place. Kalouga is also important, from its manufacture of canvass and coarse woollens, and from the fertility of the district. Orel is the capital of a very productive government, and sends great quantities of corn and other necessities by the Oka to Petersburg. Voronez or Voroneje, almost founded by Peter the Great, has become one of the largest and most populous towns in the empire. Situated at the junction of the river of its name with the Don, under the mild influence of a southern climate, and in a plain very fertile in corn, it carries on a very extensive trade with the Black Sea. It borders immediately on the vast southern steppes. Smolensko, on the western border of the empire, and which gained such a fatal celebrity in the late war, suffered almost as much as Moscow. Its venerable cathedral, however, presenting one of the finest specimens of Russian ecclesiastical architecture, stands on a height uninjured, though amid heaps of ruin.

3431. *The arctic provinces of Great Russia, — Vologda, Olonetz, and Archangel, —* are in the same latitude with Scandinavia, to which they present almost an exact parallel. They are overspread with vast forests of pine and fir, which, in approaching the shores of the Northern Ocean, become stunted and disappear. The southern tracts produce considerable crops of oats, which are sent down the Dwina to Archangel, in large covered boats that never return, but are broken up for firewood. Archangel, the only Russian port before the acquisition of Petersburg and the shores of the Euxine, was then a flourishing emporium, with 30,000 inhabitants. Its merchants still provision the whole coast of the Northern Ocean, and carry on the fishery with considerable activity: about one hundred vessels, from England, Holland, and Germany, enter the port. There are several churches and public buildings, on a scale rather suited to its former greatness than to its present decline. Vologda, near the head of the Dwina, is an industrious manufacturing place, and maintains a considerable intercourse between Petersburg and Archangel.

3432. *White or Malo-Russia*, called also the Ukraine, has undergone various revolutions. It was the centre of Russia as first known to the Greeks, when Kiev, its capital, was boasted as a rival to Constantinople. It passed then through the hands of the Tartars and the Poles, till the conquering arms of Russia again reunited it, but as an appendant province. The Malo-Russians are a distinct race, decidedly superior to the Red Russians. They excel them, according to Dr. Clarke, in every thing that can exalt one class of men above another: industry, honesty, courtesy, cleanliness, neatness. Their houses are carefully whitewashed, the interior well furnished, and nicely clean. Malo-Russia is one extensive and fertile plain, not so ill cultivated as the rest of the empire, and therefore more populous. The ancient and venerable city of Kiev is majestically situated on an amphitheatre of hills overlooking the broad expanse of the Dnieper. In this situation, the numerous churches and convents of the sacred city, with their gilded domes, make even more than the usually splendid appearance of Russian cities; but when the traveller has toiled up the steep wooden paved road which leads to it, he meets with the same disappointment. Old Kiev is in a great measure deserted; though still interesting to the antiquary, as it contains the church of St. Sophia, the oldest in Russia; and, if not an exact model of the church of the same name at Constantinople, at least of Byzantine design. The new town is carefully fortified, though only with earth; but its walls and its spacious arsenal are both kept in good repair. The population is usually said to be 40,000; but neither Mr. James nor Dr. Lyall allow more than 20,000. Tchernigof and Charcof are considerable and well-built towns; the latter has an university. Pultowa is situated in one of the most productive parts of the Ukraine, and carries on a pretty good trade; but it is chiefly celebrated for the great battle in which all the brilliant

great Hanse confederacy, gave rise to the northern proverb, "Who can resist God and the great Novogorod?" Even after Ivan had subdued it, carried off its great bell, and established his tribunal of blood, it was still the greatest town, though not the capital, of all Russia. The foundation of Petersburg gave it a more deadly blow than all its former calamities; and it is reduced to a third-rate place of 8000 or 10,000 people. Yet the crowd of domes and spires rising from its numerous churches and convents give it still a very magnificent appearance in the approach; but these, on arrival, are found standing solitary on a vast plain, while the inhabited circuit is only about a mile and a half, a great part of which is unoccupied. It is now much surpassed by Nizni (or Little) Novogorod, whose fair, already mentioned, makes it the commercial link between Europe and Asia. Its population varies, according to the season, from 15,000 to 150,000. The situation, at the junction of the Oka and the Volga (the latter here navigable for vessels of 1000 tons), is most happy for trade, but exposes it to the danger of inundation. Vladimir, once the capital of Vladimir the Great, is still a handsome little city, finely situated, and with the remains of a very

fortunes of Charles XII. were wrecked, and the star of Russia became finally ascendant in the north.

3433. *Southern Russia* consists of a vast expanse of level plains or steppes, extending to the south of the Black Sea, and watered by the great and broad rivers of the Dnieper, the Dniester, and the Don. These plains are chiefly covered with luxuriant pastures, and have only recently and partially felt the plough; which, however, has produced immense crops of the finest wheat, capable of rendering this region the granary of the Mediterranean. "Savage from remotest time," it was the Scythia of Darius; and all its habits and population continued to be Scythian, till Peter and Catherine infused into it the principles of civilisation, which are now making rapid progress. It is even apprehended by some that this region is advancing towards a period when it will shake off the Russian yoke, and form itself into a separate kingdom. Ekaterinoslav, in the interior, is the nominal capital, but is only a large country town. Odessa (*fig. 466.*), on the Black Sea, is the real capital and centre of commerce for

466

ODESSA.

all southern Russia. This city, which has sprung up as if by magic, in the midst of a desert, was founded by Catherine, in 1796, on the site of a Tartar village of a few huts. Notwithstanding the efforts of Catherine and of Paul, it did not attain any great importance till the Turks were obliged to open the navigation of the Bosphorus, and Alexander placed it

under the able administration of the Duke de Richelieu. From that time it rose rapidly, till it has become the second commercial city of Russia. It was once supposed to contain about 40,000 inhabitants, but of late it has rather declined; and Dr. Lyall believes that it does not now contain more than 30,000. It is a sort of southern Petersburg, regularly built, with handsome edifices, though on a smaller scale. It labours under the disadvantage of a want of water. In 1827, the value of the imports into Odessa was estimated at 12,500,000 rubles, and that of the exports at 18,500,000. Wheat is the great article of export; and Odessa is as famous in southern Europe for the exportation of this grain as Dantzic is in the north. During the war with Turkey, the commerce of Odessa was confined within comparatively narrow limits; but it has since become of more importance than ever. Cherson was built, in 1778, as the destined port of the Black Sea; but its unhealthy situation, and the obstructed navigation of the Dnieper, have enabled Odessa to supplant it. It is distinguished by the death of Howard the philanthropist, and a simple monument erected to his memory. Nicolaief is a neat pleasant town, and has become a considerable naval arsenal. The commerce of the Don and the eastern branch of the Black Sea is carried on by Taganrog, boldly situated on a promontory overlooking the Sea of Azof. It has the disadvantage of water so shallow that ships cannot approach nearer than ten miles; while the sea is frozen for nine months in the year. Here the Emperor Alexander died suddenly, in 1825. During the short season of commerce, the throng at Taganrog is immense; and 6000 waggons may sometimes be seen assembled in the plains behind. Azof, notwithstanding its importance during the wars of the Crimea, is only a poor village, with a small garrison.

3434. *The country of the Don Cossacks* is the chief settlement of that remarkable people, who seem to have nothing Russian in their origin and nature, but to be a mixed Caucasian and Tartar race. They are well known in Europe as the most harassing light troops that ever exercised a predatory warfare in the train of any army. At home, they have excited the admiration of travellers by the arts and virtues of peace. They are handsomer and taller than the Russians, whom they surpass also in honesty and dignity. "Polished in their manners," says Dr. Clarke, "instructed in their minds, hospitable, generous, disinterested, humane, and tender to the poor; such are the natives of Tcherkaskoy. They form a sort of independent republic, paying no taxes to Russia, but cheerfully bringing forward their numerous and valuable contingent of troops. They drive a pretty brisk trade, and many of them acquire considerable wealth. A matron of Tcherkask, who walks barefooted, will, per-

467

TCHERKASK.

haps, have a casket of pearls worth some thousand rubles." The original Tcherkask (*fig. 467.*) lies on the Don, and is a sort of city floating on the water; but the unhealthiness and frequent inundation hence arising has caused the erection of New Tcherkask, in a high situation on the Alsai, a tributary of the Don; which, though

less favourable for trade, has drained the old city of the bulk of its inhabitants.

3435. *The Crimea*, the most southern peninsular portion of the empire, was long celebrated as the solitary link which connected the civilised world with the boundless domain of Scythian barbarism. Even prior to the time of Herodotus, the Milesians had formed trading settlements in this quarter. Under the name of the Cimmerian Bosphorus, it became attached, in a somewhat precarious manner, to the empire of Rome, which built there the important city of Theodosia. During the middle ages, the Genoese formed the flourishing settlement of Caffa, through which they obtained even the commodities of India, which were forced, by the disturbed state of Western Asia, to take the circuitous route of the Oxus and the Caspian. More recently, under the Crim Tartars, it became the seat of a monarchy of some power, ruled by a khan, though with a certain dependence upon the Porte. The overwhelming power of Russia, after a most desolating and destructive war, made a complete conquest of the Crimea. The government has since made considerable efforts to repair the ravages committed by its armies; but it has yet been unable to restore this fine country to its former prosperity. The Crimea is traversed by a range of mountains, not very lofty, but bold and picturesque, and which shelter most beautiful valleys, enjoying a mild and luxuriant climate (*fig. 468.*). It was until a recent period rich in monuments and antiquities

468

MOUNTAIN OF ADEN DAGH, IN THE CRIMEA.

belonging to the different nations by whom it has been occupied; but of these it is now in a great measure rifled. Sympheropol, which the Russians have made the capital, is pleasantly situated on the western coast; and, though not well built, has a very handsome cathedral. In the interior from this place is the Tartar capital of Bakitchiserai, finely situated among romantic hills,

on the terraces of which the houses are built; and the palace of the khans (*fig. 469.*), even in ruin, makes a magnificent object. At the opposite extremity, Caffa, once called the Crimean Constantinople, has been reduced by the Russians almost to a heap of ruins; but it is beginning to revive. One of the most remarkable features is that of the excavated rocks in the valley of Inkerman; where they appear hewn into chapels, cells, and other apartments, which astonish by their variety and intricacy. They are supposed to have been the work of fugitive Christians during the ages of persecution. The strong fortress

469

PALACE OF THE KHANS OF THE CRIMEA.

of Perckof, commanding the narrow mouth of the peninsula, has lost its importance since the Crimea became Russian.

3436. *The kingdom of Kasan* forms a semi-Asiatic member of the empire. Down to the sixteenth century it was a Tartar kingdom, held by a branch of the posterity of Zingis; but in 1550 it yielded to the arms of Ivan. The people are still chiefly Tartars, and more civilised than the bulk of that race; cultivating the ground with diligence, exporting corn, and bestowing still greater attention on their flocks and herds. They also tan, and even embroider leather, and make much soap. There are extensive forests of fine oak, and other trees of a superior description to those found in the north and centre of Russia. The eastern part contains great quantities of iron, copper, and other valuable minerals. The city of Kasan is reckoned the third in the empire; having 40,000 inhabitants, of whom 12,000, and the most industrious, are Tartars. The city being built and its streets paved with wood, was reduced to ashes, in 1815, by a great conflagration, which consumed the cathedral and palace, leaving only the handsome church of St. Peter and St. Paul. In the rebuilding of it, this exclusive use of wood has been discouraged. Viatka is connected with northern Russia, and sends its corn down the Dwina to Archangel. Perm is a rude wooden town; but, bordering immediately on the Urals and on Asia, it thrives by transmitting westward the rich mineral produce of that chain of mountains. Simbirsk and Samara, on the Volga, and Penza, on its tributary the Sura, are similar wooden towns; which have considerable employment in the fisheries of that river, and in conveying by it to the capitals the plentiful produce of the surrounding countries.

CHAP. XVII.

GREECE.

3437. *Greece*, though bearing so great a name, and occupying so high a place in our recollections, had ceased, until of late, to be considered as having any actual existence. The torrent of Ottoman conquest, overwhelming all the institutions and monuments of the classic ages, seemed to have obliterated its place as a separate state, and to have sunk it into the subordinate province of a huge barbarian empire. But memorable events just elapsed have again produced the Greeks to the world, with claims to be considered as a great and independent people. Even under their deep humiliation, materials were not wanting, out of which their independence might be re-established. Amid the gloom of Turkish domination, the Greeks still existed as a people every way separate; not, indeed, manifesting their former high displays of genius and heroism, yet still remaining distinct in language, manners, and religion, and exhibiting even revived symptoms of intellectual and general activity. After witnessing the glorious though chequered efforts made by the nation itself, and though with various success; considering the part now publicly taken by the states of Europe, we can no longer hesitate to sever Greece from the Turkish empire, and give to it a place among European nations.

3438. *What is, or is not, Greece*, is a question of no little difficulty. As it consisted, even anciently, not of any single state, but of a class or confederation of states, the name was applied always under various gradations. Peloponnesus, now the Morea, with Attica, Bœotia, and the islands of the Ægean, might be regarded as the central and integral parts. Thessaly, Ætolia, and Crete formed a sort of outer and ruder Greece, not thoroughly incorporated, yet still not belonging to the domain of the barbarian. Macedon was held as within that outer domain, till, becoming mistress of the whole country, it was at length received as one of the leading states of Greece. In modern times, the name of Greece has

been given to the widest of these ranges ; and as the chief local interest of its scenes consists in the comparison of what they were with what they now are, we shall, with a view more effectually to accomplish that object, adhere to this more extended view of the subject.

SECT. I. *General Outline and Aspect.*

3439. *Continental Greece* consists chiefly of a long and somewhat narrow peninsula, lying between the Adriatic and the head of the Gulf of Salonica. It shoots out, however, beyond this peninsular space, as far as the great range of the Despoto Dag, the ancient Rhodope, which bounds it on the north. Greece thus forms a space of nearly 400 miles in length, and little more than 100 in general breadth. The area, including the contiguous group of the Cyclades, has been calculated at 58,750 square miles, which is nearly the size of England. It includes on the south a smaller territory, of a form more decidedly peninsular, the Peloponnesus, now the Morea, connected with the continent only by the narrow isthmus of Corinth. In this peninsula, or immediately adjoining, were all those states which rose anciently to the greatest height of glory ; and within it too those recent efforts have principally been made that have ended in its emancipation from Turkish sway.

3440. *The mountains of Greece* are both lofty and very extended. On the north, it is enclosed by the snowy summits of Arbelus and Rhodope, which the early Greeks considered as the boundaries of the earth. Their height is great, though not yet fully ascertained. From this central nucleus successive chains descend southward to the Ægean, bearing the celebrated and classic names of Pindus, Olympus, Parnassus, Helicon, and Cithæron. These mountains are lofty, and present many bold features ; but they are not of the first magnitude, nor do any of their peaks appear to rise higher than 6000 or 7000 feet. They are so disposed as to enclose large circular basins, which slope to a level plain of rich alluvial soil. So completely are many of these fertile tracts shut in, that they communicate with the rest of the country only by the narrow strait through which the waters force their way. They thus suggest the idea of having once formed inland lakes, whose waters, having found an outlet, are now converted into rivers. This formation singularly favoured that original division into a number of small separate states, which formed so long the principle of the Greek political system, producing such varied features and such grand effects of activity and rivalry. Peloponnesus consists of a great central table-land, the ancient Arcadia, now the seat of the Mainotes, and which on all sides slopes down to a plain on the sea-coast. The Cyclades are high and rocky. Greece, even independently of its classic monuments, displays scenery perhaps as fine as that of any other country. Though it wants the majestic mountains of Switzerland, and the luxuriant plains and brilliant skies of Italy, it combines sublimity and beauty in a happier manner, perhaps, than either. As an additional feature, the crowded Cyclades diversify its seas, combining with the opposite continent to form every variety of apparent lakes, gulfs, and bays, and exhibiting bold and striking rocks and headlands. All this is vastly heightened by the noble monuments, in the most picturesque state of ruin, which are to be found in this region.

3441. *The rivers of Greece*, in consequence of its broken and insulated aspect, and of its universal proximity to the sea, seldom reach any important magnitude. The Vardar, the ancient Axios, descends from the chain of Rhodope into the Gulf of Salonica ; and the Drino, from the same source, flows into the Adriatic ; both having a course of 150 or 200 miles. But the streams which the poets have immortalised, the Cephissus, the Ilissus, and the Eurotas, even the Alpheus and the Achelous, are little more than brooks almost dry, unless when swollen by the rains.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

3442. *The Geology* of this country is similar to that of Hungary.

SUBSECT. 2. *Botany.*

3443. *The Botany* of Greece is described with that of Turkey.

SUBSECT. 3. *Zoology.*

3444. *The native Zoology of Greece* is no better understood than that of the tyrannic nation under which it so long groaned ; nothing satisfactory can, therefore, be stated of its zoological features. Some cursory notes on the birds common to Britain and Greece, by Mr. Hawkins, will be found in the last edition of Pennant's *British Zoology*.

3445. *The entomology*, judging from that of the Peloponnesus, must be highly interesting, as presenting many forms more strictly belonging to Africa. In the island of Zante, and on the plains of Elis, we found, in the spring, no less than three species of beautiful hairy beetles, of the genus *Amphicoma*. One of these (*fig. 471.*), from its general resem-

blance, when flying, to a wasp, we at first mistook for an hymenopterous insect : it feeds on flowers, and at that time was in such prodigious numbers, that we might have captured hundreds, nay, thousands.

471

HAIRY BEETLES.

That elegant and uncommon insect, the *Panorpa Coa* of Linnæus, at the same season, may be met with in plenty on all the open plains, together with several species of *Myrmelion* ; one of a very large size, and not hitherto described.

3446. *One of the most singular domesticated animals* is the Turkish pig, more common, however, in Greece : the head of this race is short and narrow, the ears erect and pointed, the legs and body very short ; the hairs are frizzled, and the colour is usually dark grey. The islands of Candia

and Crete are both remarkable for two peculiar breeds of sheep.

3447. *The Cretan sheep*, from the unusual character of their horns, have been, by some, considered a distinct species from the domesticated race. Their form is handsome ; the horns are long, and furnished with a strong

WILD MUSMON SHEEP.

472

frontal ridge ; those of the ram generally form a complete circle at the base, and then turn in three additional spiral twists, ascending vertically ; the tail is long, and the whole body covered with coarse undulating wool. In the female the horns are divergent, straight, and twisted into four turns on their own axis. From this breed has descended the Wallachian.

3448. *The wild Musmon sheep* (fig. 472.) is still said to be found in Candia, as well as in the highest mountains of Sardinia and Corsica. Major Smith considers that this species makes the nearest approach to the various domestic races now dispersed over Europe. The horns are rather short, and curved backwards, the points being turned inwards ; the usual colour is brownish or liver-coloured grey ; the throat has a tuft of long hair, and the back and flanks are marked by a dark streak ; the chaffron is much arched. These animals never quit the highest ridges, where they live in small herds, headed by an old male ; but occasionally unite in flocks of near 100. It is doubtful whether this species be specifically the same with the wild sheep, formerly abundant in Spain, and probably in all the high primitive mountains of temperate Europe.

3449. *The Albanian dog* has been celebrated from remote antiquity. It is still a very fine and pure breed, as big as a mastiff, with very long, thick, silky fur, generally of different shades of brown ; the tail is long and bushy ; the legs seem more calculated for strength than excessive speed, being stouter and shorter than those of the greyhound ; the head and jaws are lengthened, and the nose pointed. We suspect that the famous large black spaniels of Mount Etna and Calabria must have originated from this classic race.

SECT. III. *Historical Geography.*

3450. *The historical ages of Greece* include one of the most splendid portions of the annals of mankind, and, if treated in any detail, would far exceed our limits. We can but rapidly indicate the leading epochs. These are, —

3451. *The early or heroic ages*, when the different valleys of Greece were ruled by petty princes, afterwards called tyrants. To this age belong the exploits of Hercules, Theseus, and other chiefs exalted into demigods, for the zeal with which they redressed and punished oppressions, of which many of these petty chieftains were guilty. The Trojan war collected together the scattered portions of the Grecian people, made them known to each other, and gave a great impulse to the national mind.

3452. *The era of the freedom and glory of Greece* began when the different little states threw off the yoke of their tyrants, as they now called them, and erected themselves into independent republics. The enthusiasm produced by this event was wonderfully heightened when all the armies of the East, united under the standard of the Great King, were vanquished in a series of battles the most glorious which history has ever recorded. Greece now took the lead among all the nations of the world ; and in the succeeding period, though her strength was unfortunately wasted by intestine dissensions, she added to her military glory that of carrying eloquence and the arts to a perfection which has served as a model to all succeeding ages.

3453. *The conquest by Macedon* subverted the liberty of Athens and Sparta, and with it all their greatness and glory. Yet Greece, as identified with Macedon, saw her conquests carried to the most distant regions ; and Greek kingdoms, Greek laws, and the Greek language prevailed from Egypt to the borders of India. Even Greece itself, especially at the period of the Achæan league, threw out some brilliant sparks of her ancient flame ; and letters and arts continued to be cultivated, though not with the same ardour.

3454. *The conquest by Rome* terminated the political existence of Greece ; yet in some respects she subdued even her conquerors. Her fame in arts and eloquence remained undiminished ; and the greatest of the Romans, and all who aspired to eminence in learning, came to study in her schools. Athens continued still to be the intellectual capital of Greece, and even of the civilised world.

3455. *The conquest by the Ottomans* finally extinguished in Greece every thing that remained of her ancient greatness. The Greeks were made "the slaves of slaves," and even their character became deeply tinctured with the degradation which, in such circumstances, can scarcely be avoided. The mountains, however, still afforded shelter to numerous bands, who, under brave and hardy chiefs, not only maintained a practical independence, but carried devastation into the neighbouring plains.

3456. *Attempts at emancipation* were not wanting, even in the periods of the greatest depression of Greece. Supported by Venice, the Mainotes rose, in the end of the seventeenth century, and maintained the contest for several years. Another insurrection was raised in 1770, in consequence of the landing of 2000 Russians; but this was soon suppressed. In 1790, the Suliotes, roused by the same instigation, performed prodigies of valour; but being encountered by the energies of Ali Pacha, they were nearly exterminated. Lastly, in 1820 came the grand insurrection, with its strange vicissitudes, which must be fresh in the recollection of the reader. Internal dissension, worse than the foreign sword, has repeatedly brought the cause to the brink of destruction; but the treaty concluded at London between Britain, France, and Russia; with its consequences, the battle of Navarin, and the expulsion of Ibrahim Pacha, have obliged the Porte to consent to the independence of at least those portions of Greece which were most decidedly Grecian. The rejection of the crown by Prince Leopold threatened to leave it a prey to internal dissension; but the recent nomination of Otho of Bavaria, supported by the great powers with money and troops, affords the hope that it may soon subside into a more tranquil and settled condition.

SECT. IV. *Political Geography.*

3457. *Constitutional monarchy* is the form of government destined for Greece by the great powers, and in which she appears to have acquiesced; and a monarch, after many difficulties, has at length been chosen. The political elements are by no means duly organised. The two parties are that of the people, composed generally of the inhabitants of the towns, and having at its head the commercial state of Hydra; and that of the *capitani*, or chieftains, who, in the interior of the country, have established a species of feudal military sway.

3458. *Greece*, considered as a free state, has been contracted in extent, in consequence of the reverses sustained by the national arms, and the treaty concluded by the European powers; and includes only a small portion of what we have been accustomed to consider as Greece. Bounded on the south by a line nearly from the Gulf of Volo to that of Arta, it excludes the extensive and populous territories of Thessaly, Macedonia, and Albania. The Morea and the islands appear to be all that have been yet fully and regularly organised: they have been divided into thirteen departments; of which seven are in the Morea, and six in the islands.

3459. *The seven continental departments* are, — 1. *Argolis*, containing the towns of Napoli, Argos, and Corinth; 2. *Achaia*, in which are Patras, Vostetza, and Calaurita; 3. *Elis*, containing Gastouni and Pyrgos; 4. *Upper Messenia*, with the towns of Navarin, Modon, and Coron; 5. *Lower Messenia*, in which are Calamata and Leondari; 6. *Laconia*, containing Misitra and Maina; and 7. *Arcadia*, comprising Tripolizza and Caritene. These seven departments are supposed to contain 6439 square miles, and to have a population of 300,000.

3460. *The six insular departments* consist of, — 1. *The Northern Sporades*, Skiro, Ipsara, Skiato, &c., 72 square miles, and 60,000 people; 2. *The Western Sporades*, Hydra, Spezzia, Poro, Egina, and Salamis, 126 square miles, and 40,000 people; 3. *The Northern Cyclades*, Andros, Tino, Mycone, Syra, Thermiæ, Zea, Serfo, 308 square miles, and 46,400 inhabitants; 4. *Central Cyclades*, Naxos, Paros, Ios, Sikina, Policandro, Milo, Kimoli, Siphnos, 376 square miles, and 25,200 inhabitants; 5. *Southern Cyclades*, Amorgo, Stampali, Anaphia, Santorin, Scarpanto, 212 square miles, and 19,900 people. The whole population of the isles is thus reckoned at 144,000; which, added to the Morea, makes 444,000. The territory without the Morea is provisionally divided into Western Greece, having for its capital Missolonghi; and Eastern Greece, of which the chief place is Athens.

3461. *Hydra*, a little rock, never heard of during the ancient greatness of Greece, has raised itself, by its commerce, and the boldness and courage of its mariners, to be the life of the Grecian confederacy. Even in 1765, Chandler found the Hydriotes in possession of 120 vessels, having compounded with the grand signior for two purses yearly as *haratsh*, or tribute, and being allowed the rare and valued privilege of using bells in their churches. "They soon," says he, "discovered their native rock, which they beheld, though bare, and producing nothing, with the same partiality of affection as if it were adorned with the golden fruits, and perfumed with the aromatic gales of Scio; pointing it out, and expatiating on the liberty they possessed there." The naval exploits of the Hydriotes have been the chief bulwark and glory of Greece, in its daring contest with the Ottoman power. The government is chiefly conducted by several families; the Conduriotti, Miaulis, and

Tonibage, who have amassed great wealth by commerce. They have always supported an united government, and the authority of the general congress, against the lawless sway of the capitani; but, being destitute of land forces, they have but small means of compelling the rest to accede to their views.

3462. *The capitani* hold nearly all the mountainous tracts and upper valleys of Greece. Aided by their fastnesses, they either maintained an original independence, or attained a new one on the decline of the Turkish power. Many of them were at first shepherds, whence they rose to be robbers, and at last to be chiefs, somewhat similar to the heads of the Highland clans. Their adherents are not held, however, by the same deep hereditary attachment, but chiefly by hopes of pay; and when these diminish they readily enlist into a more profitable service. Colonel Stanhope has given Stonaro as a specimen of a capitano. He held sway over 120 villages, each containing about seventy families. He himself owned in the mountains 7000 or 8000 head of cattle, and his family nearly 500,000. These were let out to herdsmen, who paid for each a certain amount in butter, cheese, and wool. In the plain, the cultivators, who are tolerably industrious, pay their rent in three parts; one to the capitano, one to the Turks, and one to the maintenance of the troops. Stonaro can command 400 regular fighting men; and, when he summons all his peasants, can produce about 3000. These chiefs have usually a fastness in the most inaccessible part of the mountains, to which they can retreat, in cases of urgent necessity; such as the cave in Mount Parnassus, where Odysseus kept his family and treasure, and held at defiance both the Turks and the hostile party among the Greeks.

3463. *The military force* consists almost entirely of the bands of these capitani, called and held together through personal influence. They are altogether of the description of light troops, and form excellent mountain warriors. They make light desultory attacks; they entrench themselves in the passes and on the mountain tops behind stone walls, through which they make loopholes, and fire with great dexterity; but they studiously avoid either a pitched battle, or the storming of a fortified post. All the Greeks, according to Mr. Humphreys, love to get as much, and to fight as little, as possible. They can bear, however, astonishing hardships and privations; and all this did very well, while they had only the tumultuary assault of the Turks to contend against; but when the Pacha of Egypt brought against them troops trained somewhat according to the European model, they proved unequal to the contest, and might probably have fallen, had it not been for foreign interference. The attempts to raise a regular force, to which they have been stimulated by their European friends, have failed, partly through want of means and management, and partly from the disdain which the free soldiers who fought under the capitani entertained for the mechanical tactics to which their leaders proposed to subject them. The Morea, it is said, can muster 15,000 fighting men; but it is seldom that more than 6000 can be assembled in one army. The Greeks of the country without the Morea are reckoned braver, particularly those of the mountains of Olympus, who could collect 12,000 men, if they had the means of equipment.

3464. *The navy of Greece* has attained the highest glory; yet it is of very small force and equipment. She has not a vessel which can aspire to the rank of a frigate; and her little armed brigs do not exceed 80 tons; some have even rated them at 40. Their bold and skilful manœuvres have, in Count Pecchio's apprehension, rather frightened than beaten the enemy, and have at no period made them masters of the sea. They never were able to prevent the Turks from disembarking troops at any point, nor have they formed a regular blockade of any sea-ports in their possession.

3465. *The other parts of administration* do not as yet exist in any organised state. There are scarcely any revenues except those arbitrarily levied by the capitani; and with respect to the English loans, neither principal nor interest has yet been paid. Justice, in any regular form, there is said to be none, though a tolerable police is maintained by the chiefs.

SECT. V. *Productive Industry.*

3466. *Industry, in Greece*, is only in a very secondary state, yet its products are not inconsiderable.

3467. *Agriculture* is carried on with rude implements and bad cattle, and only in some quarters is irrigation practised with diligence; yet so genial are the climate and soil, that the harvests are generally more plentiful than in England. Wheat, barley, and maize are chiefly cultivated, and of each there is some surplus for exportation. Cotton, for which the demand is now so extensive, is raised to a very great extent, especially in the plains of Macedonia, and forms the chief basis of its export trade. The olive in Greece, and especially in Attica, retains its ancient celebrity; "nor has the honey of Mount Hymettus lost any part of its exquisite flavour." That species of grape called the Corinthian, which produces the finest currants, is peculiar to the Morea and the Ionian Islands, especially Zante, from which it is largely exported. Greece, however, is altogether a pastoral country; the people are skilled in the management of cattle, but much more in that of sheep and goats, which are fed in vast numbers on the sides of the hills, and on the high plains of the interior. Of these animals, however, the breed is not of any eminence, and has even degenerated.

3468. *Manufactures* are in a still ruder state than agriculture; and the country is indebted to foreigners for every thing, except a few coarse and common fabrics. There are, however, some respectable manufactures of carpets, silk, network, and Turkey leather at Salonica; of the last article, with fine pottery, at Larissa; and with embroidery at Joannina. The spinning and dyeing of cotton yarn is carried on in Thessaly and Macedonia to a considerable extent.

3469. Commerce is carried on with much greater activity than any of the other branches of industry, and has been one of the main instruments in raising this renowned country from its extreme depression. The great circuit of its coasts, its numerous bays, and its position in the vicinity of some of the richest and most productive countries in the world, clearly destined Greece to be a maritime and commercial region. The proud ignorance of the Turks, leading them to despise trade, left this career open to the vassal people. A prodigious impulse was given by the general war consequent on the French revolution, which left the Greek for a long time the only neutral flag in Europe. The islands, and particularly the little harbours of Hydra, Ipsara, and Spezzia, not only exported the produce of Greece itself, but maintained the carrying trade from port to port all round the Mediterranean. There was even an extensive transmission of

articles to the head of the Gulf of Salonica, and thence by land into the heart of Austria. A Greek mercantile and shipping interest of great wealth and importance was thus created. Mr. Hobhouse, in 1809, estimated the number of her mariners at 50,000. Mr. Maclaren, in his elaborate and interesting view of Greek industry, thus reckons the exports:—Cotton, 1,200,000*l.*; tobacco, 56,000*l.*; corn, 809,700*l.*; wool, 67,000*l.*; olive oil, 100,000*l.*; currants, 40,000*l.*; silk, cheese, cattle, dye-stuffs, honey, fruits, 577,000*l.*: in all, 2,649,700*l.* In speaking of the commerce of Greece, we would be understood to speak of what has been, and of what may be, but scarcely at all of what is. During the late dreadful contest it was trodden under foot; and the Hydriots, in whom it centred, had all their resources occupied by war; nor has it probably revived at all to its ancient extent.

SECT. VI. *Civil and Social State.*

3470. *The population of Greece*, an interesting question, has been calculated as yet only by the rudest estimates. The most generally followed has been that of Beaujour, who assigned to Macedonia, 700,000; Epirus, 400,000; Thessaly, 300,000; Ætolia, Phocis, and Bœotia, 200,000; the Morea, 300,000; Attica, 20,000: making in all, 1,920,000. Pouqueville, upon careful enquiry, stated the Morea at 420,000; Mr. Waddington, more recently, at 500,000; and Mr. Humphreys, who had official means of information, and does not show any great disposition to over-rate Greece, at about 600,000. Pouqueville makes the dominions of the late Ali Pacha, including Albania, Thessaly, and part of Macedonia, to contain 1,500,000. There seems little doubt that every part of Beaujour's estimate is under-rated. Mr. Maclaren, in the *Encyclopædia Britannica*, assumes 2,700,000. We should rather be inclined to 3,000,000 for continental Greece, and nearly 500,000 for the European islands, exclusive of those belonging to Asia. Mr. Humphreys reckons Hydra, Ipsara, and Spezzia at 60,000. It is an interesting question, what part of this population is Greek? Colonel Leake conceives that, in continental Greece, this part does not exceed 1,000,000; but we should rather adopt Mr. Maclaren's idea, that it averages one half of the whole population. The number, however, which has ever been actually organised or arrayed against the Turkish power probably does not exceed 1,000,000.

3471. *The character of the modern Greeks*, both before and since the revolution, has been painted in somewhat unfavourable colours. They are represented as addicted to the vices incident to every despised and oppressed people; avarice, intrigue, cunning, servility, and as being almost entirely governed by motives of self-interest. The reproach, however, seems to be mainly due to the inhabitants of the towns, and the chiefs, particularly the Fanariots, or rich Greeks of Constantinople. The peasantry are allowed to be a very fine race; and, indeed, the great actions performed in the course of the late contest must silence those who pretend that the nation has lost all its ancient energies. "With all their faults," says Mr. Humphreys, "they are highly gifted; they possess a fine genius, and an acuteness in intellect, a tact, and a natural grace in manner, unequalled by any other nation." Even the capitani in their country-seats maintain a dignified and courteous hospitality, and a paternal kindness towards their retainers, resembling what is occasionally seen among the old *lairds* of Scotland. The female sex enjoy greater liberty, and are treated with much more respect, than among the Turks. They are distinguished by beauty, and by a remarkable delicacy of features and complexion. The Greeks of the cities, on the contrary, when they get rich, study to imitate the manners, and even the costumes, of the Turkish pachas, the only models of grandeur that exist within their observation. "The Greeks," says Count Pecchio, "sit à la *Turque*, and will continue to do so for a great length of time; they eat pilau à la *Turque*; they smoke with long pipes; they write with their left hand; they walk out accompanied with a long troop of armed people; they salute, they sleep, they loiter about, all à la *Turque*. Initiated into that mingled servility and insolence which despotism tends to introduce, they exhibit many examples of that moral degradation which has been hastily imputed to the Greek nation in general."

3472. *The religion of the Greeks* is that which was designated by their name, to distinguish it from the Roman catholic, after the great schism of the eastern and western churches. This, however, may be considered on a lower level as to any enlightened views of Christianity. According to a late writer, the lower ranks in Greece have a religion of mere forms, while the upper ranks have no religion at all. The most respectable of the clergy are the monks or *caloyers*, out of whom are chosen the bishops, and even the patriarch or general head of the religion, who, before the late convulsions, resided at Constantinople. Some of them are men of theological knowledge, who lead regular lives; but a violent spirit of intrigue prevails in pursuit of the dignities of the church, which are bestowed by election. The secular clergy consist of the *papas* or village priests, who, as is usual among an unenlightened people, exercise the most unbounded influence over the minds of the lower ranks. This influence, though often abused, is, perhaps, on the whole beneficial; but these *papas* seem to exert themselves as little as any class in infusing just views and sentiments into their parishioners. Some of them even scruple not to take the field along with the robbers, and receive a portion of the booty.

3473. *Learning*, in Greece, where it once flourished with such unrivalled splendour, had fallen into a state of total extinction. With wealth and the spirit of independence, however, had arisen a strong desire to revive the ancient intellectual glory of their country, and some progress had been made. Several schools and colleges were founded, and in a flourishing state; among which that of Scio was above all conspicuous. The most distinguished young men were sent to be educated in the French and German seminaries. Greece could boast several writers of some eminence, and many of the best works of the western writers had been translated. The Turks viewed this career with jealous eyes. Two literary men, (one, the translator of Anacharsis, and the other an eminent poet, who had endeavoured to arouse in his countrymen their ancient spirit,) having been basely delivered up by Austria, were put to death. Yet the public libraries continued in a state of progressive advance, down to the period of the revolution, when they were almost all destroyed; and Greece seemed to be thrown back many steps in the career of letters. As soon, however, as the government had acquired a degree of consistence, they turned their immediate attention to this object; and, really, considering the pressure of so dreadful a war, effected wonders. They established schools of mutual instruction at Athens, Argos, Tripolizza, Missolonghi, and most of the islands. They decreed the formation at Argos of an academy on a great scale, where every requisite of intellectual culture might be united; also of central schools and libraries. All these institutions are yet only in their infancy; but there cannot be a doubt that, the independence of the Greeks being once established, one of the first results would be an extraordinary effort to raise their intellectual character as a nation.

3474. *Among the amusements* of the modern Greeks, the dance seems to stand foremost. They scarcely meet without dancing; and frequently, according to ancient custom, in the open air, or the areas of their churches. Many of their dances have a classic character, and are probably of antique origin. They have a grand circular dance, one of a very intricate figure, in celebration of the vintages, and one called the *creene*, supposed to have been invented by Theseus. Their dances are often choral, accompanied with songs; and the taste for music is very general. Foot races, wrestling, throwing the disc, undoubtedly handed down from antiquity, still maintain their place among the youth. The athletes pursue the exercise of wrestling in a manner which appeared to Pouqueville entirely similar to that which, according to ancient writers, was practised at the Olympic games. They present themselves undressed from the waist upwards, music plays, they advance with measured steps, beating time, and animating themselves by humming certain airs. At the close of the contest a prize is bestowed on the victor.

3475. *The dress* of the Greeks is formed on the model of the Turkish, either from imitation, or from adoption of the same oriental pattern. Since the commencement of their independence, they have even made it a kind of triumph to display the green turban and other symbols which Moslem bigotry had prohibited to be worn by any infidel. In general the attire of all who can afford it is gaudy and glittering, covered with gold and silver embroidery, and with the most brilliant colours. Above all, the arms of the chiefs are profusely adorned, mounted with silver and even jewels. The simplicity which a more refined taste has introduced into the costume of the western Europeans is held by them in contempt. The Greek female walks abroad in a robe of red or blue cloth, over which is spread a thin flowing veil of muslin. At home she is, as it were, uncased; and when the traveller is admitted into the gynæceum, he finds the girl, like Thetis, treading on a soft carpet, her white and delicate feet naked; her nails tinged with red. Her trousers of fine calico hang down loosely, the lower portion embroidered with flowers. Her veil is of silk, exactly suited to the form of the body, which it covers rather than conceals. A rich zone encompasses her waist, fastened before by clasps of silver gilded. She wears bracelets of gold, and a necklace of the gold coin called zechins. Much time is spent in combing and braiding the hair.

3476. *The food* of the Greeks, through the combined influence of poverty, and the long fasts enjoined by their religion, is composed in a great measure of fish, vegetables, and fruit. Caviare is the national ragout, and, like other fish dishes, is eaten seasoned with aromatic herbs. Snails dressed in garlic are also a favourite dish. Their most valued fruits are olives, melons, water-melons, and especially gourds, which Pouqueville says they prize almost like manna from heaven; but their extravagant use is suspected to be injurious to the health. The Greek pastry, combined of honey and oil, is indigestible to any stomach but that of a Greek.

SECT. VII. *Local Geography.*

3477. *In making a local survey of Greece*, we shall begin with the central districts, these being most decidedly and essentially Greece; thence proceeding to the outer region, till it passes gradually into Mahometan Turkey; and conclude with the islands.

3478. *Athens, with its territory*, forms the point to which all the highest associations connected with the name of Greece are peculiarly attached. This territory, a little rocky and hilly peninsula, which has eclipsed the glory of the greatest kingdoms, is bounded by two gulfs; viz. that of Egina, which separates it from the Morea, and that of Negropont, the ancient Eubœa, separating it from the long island so designated. On the land side it is closed by the ancient Bœotia, now included by the Turks under the sweeping appellation of Roumelia. Its dimensions, about forty miles long, and twenty broad, are those of an English county of moderate size.

3479. *The city of Athens* still holds its place among the principal towns of modern Greece. It no longer sways the destinies of surrounding states, nor pours forth the crowd of philosophers, poets, and heroes who illustrated its ancient state. Athens is extinct, both as a seat of dominion and a school of learning. It presents still, however, objects of the most lofty interest: for here are maintained, in wonderful preservation, the grandest existing monuments of sculpture and architecture; the works of a Phidias and an Ictinus, which raised those who planned them to the pinnacle of renown. The edifices of Rome, indeed, are more extended, more varied, the result of ampler wealth and resources; but those of Athens are in a style of purer and severer grandeur, and bear the stamp of loftier genius. So durable, as well as beautiful, are the materials of which they are composed, that they have survived all

the ravages of time and barbarism ; and their partial decay, in many instances, has only given to them a more solemn and affecting character. They have suffered, indeed, certain dilapidations from British virtuosi, against which recent travellers have entered a very vehement protest. Perhaps the benefit accruing to ourselves from the present position of these superb sculptures may sway our judgment ; but we cannot help observing, that, at the era of their removal, they were almost beyond the reach of all civilised spectators ; and that now they will

473

ACROPOLIS AT ATHENS.

be seen by comparatively thousands to one, and much more leisurely and commodiously than in their original site ; and there is still enough at Athens to gratify the most eager research of the student of arts and antiquity.

3480. *The Acropolis, crowned with the Parthenon (fig. 473.),* forms the most conspicuous object with which Athens, and almost any city, is adorned. It is seated on an almost precipitous hill, commanding all the surrounding country. The Parthenon, or Temple of Minerva (*fig. 474.*), was erected by Pericles during the most classic age of Athens. It

474

PARTHENON.

was of the finest white marble, encompassed with eight fluted columns of the Doric order, and adorned with the sculpture of Phidias. It did not sustain any deadly injury till 1687, when the Venetians under Königsmark threw a bomb into it, demolished the roof, and much injured the whole fabric ; after which, the Turks began to hew materials out of it, and to convert the interior into a mosque. It is now mouldering in all the solemnity of ruin. To Dr. Clarke the edifice appeared an eminently satisfactory proof of the decided superiority of Athenian design over any thing that Rome can boast ; a masterpiece of architecture, uniting the greatness and majesty of the Egyptian or ancient Etruscan style, with all the elegant proportions, the rich ornaments, and the discriminating taste of the most splendid era of the arts. In graceful proportion, in magnificence, in costliness of materials, in splendid decoration, and in every thing that may denote the highest degree of improvement to which the Doric style ever attained, it has no equal. In all that relates to grandeur, harmony, elegance, and beauty, the Parthenon is universally acknowledged a model ; even the minute details of the sculpture by which it is so highly decorated have the delicacy of a cameo. These sculptures, of which such fine specimens are now exhibited in the British Museum, rank perhaps as the very noblest examples of that art. Dr. Clarke notices, in particular, the immense frieze, on which the whole Panathenaic festival was represented in one continued basso-relievo design, originally 600 feet in length.

3481. *The multitude of grand objects in Athens* is too great for our limits to allow us to enter into more than a very general enumeration. Among the foremost may be named a range of sixteen superb columns, believed to be the remains of one hundred and sixteen which belonged to the temple of Jupiter Olympius. In 1676 there were seventeen ; but a few years before Chandler's visit, the pacha had, with incredible labour, levelled one to the ground, for the purpose of raising a mosque out of the materials. The others are still standing, sixty feet high, and about six feet in diameter, a splendid example of the Corinthian order, and built of the very finest marble.

475

ERECHEUM.

The Erechtheum (*fig. 475.*), though it consists of the two temples of Minerva Polias and of Pandrosus, is less extensive than the two just mentioned ; but perhaps surpasses them in the extreme delicacy of its sculpture and ornaments, and is considered the finest existing specimen of the Ionic. The caryatides which support the Pandroseum are of particularly exquisite workmanship. The

treatment of this beautiful edifice has been severe. The Turks made its portico a powder magazine; and though the Greeks had passed a vote to rescue it from this dishonour, their funds have been hitherto insufficient. A dwelling-house of rough brick has been profanely erected between the caryatides, and the smoke from it has blackened some of the most delicate ornaments; but, on the whole, this beautiful monument has suffered less than could

476

TEMPLE OF THESEUS.

be expected from such unworthy usage. The Temple of Theseus (*fig. 476.*), a fine Doric structure, somewhat resembles the Parthenon, and is, perhaps, as to its general outline, the most entire of all the Grecian edifices. Though the sculptures are greatly injured, enough remains to attest their original excellence. They represent the exploits of Hercules and Theseus. This edifice seems to present a striking example of that freshness "which continued to bloom upon the erections of Pericles, which preserved their faces uninjured, as if they pos-

sessed a never-fading spirit, and a soul insensible to age."

3482. *There are other structures of less magnitude*: the Propylæa, or columnar entrance of the Acropolis; the Lantern of Demosthenes; the Choragic monument of Thrasyllus; the marble Tower of the Winds; the monument of Philopappus; which excite the admiration of the traveller. There are others of which only the site and outline can now be traced: such is the Stadium, "the most wonderful of all the marvellous works of Herodes Atticus." It is formed by an excavated mountain, the ranges of seats occupying its lofty sides. This structure, on which quarries were exhausted, has now been stripped of its marble covering, and the area, 650 feet long, has been subjected to the plough; yet in Dr. Clarke's opinion every thing which is necessary to impress the mind with an idea of the grandeur and prodigious nature of the work survives, as if it existed in its most perfect state. The merely ornamental parts are not missed in a structure necessarily simple as to its form, but inexpressibly great and striking in its aspect; not merely from its artificial character, but from the grandeur of its appearance as a work of nature. The Odeum, built by the same opulent Athenian, roofed with cedar, and unrivalled in Greece for extent and magnificence, presents now only the inner front of the proscenium, and three rows of circular arches. Besides the edifices of Athens, there are some spots, which the visiter imbued with classic lore cannot contemplate without peculiar emotion. Among these is the Areopagus, the highest seat of judgment, the great resort of the Athenians, and where the apostle Paul made his lofty and interesting appeal to the minds of his intelligent auditors. The site is described by Clarke as peculiarly commanding, with a noble prospect of mountains, islands, seas, and skies; while behind rises the lofty Acropolis, crowned with all its marble temples. The visitant seeks also, but does not find, the grove of the Academy, where ancient wisdom delivered its noblest precepts. The site even can scarcely be conjectured; yet, according to Chandler, that man would still be subject to the anger of the Muses who should omit the search.

3483. *The Athens of modern times* has been a city of some distinction; even before the revolution, its inhabitants, in number about 12,000 or 13,000, displayed a superior polish and intelligence; and a society called

Philomusæ had been instituted for the cultivation of the arts and sciences. The Turks themselves had laid aside somewhat of their pompous barbarism. It is remarkable that, after having been formerly so distinguished as a maritime city, it had not a single ship belonging to it. It became, however, an important military position, the Greeks having found a spring of water in the Acropolis: after this discovery it was considered nearly impregnable, yet it again fell into the power of the Turks. While the ancient edifices nearly defied the ravages of war, about a third of the modern houses have been destroyed during the contest.

3484. *The territory of Attica* is still interesting to the traveller, from the many scenes of classic celebrity which it presents. The stream of the Ilissus does not answer the expectation raised by its fame; it is only a torrent, which in the depth of winter rushes down from the mountains. Chandler, even after rains, watched in vain for a moment when its bed would be covered with water. Mount Hymettus, rich in aromatic herbs, still produces, as already observed, the honey for which it was always celebrated. The quarries of Pentelicus (*fig. 477.*) affording the materials of so many magnificent structures, exhibit vast humid caverns, over which the wide roof awfully extends, adorned with hollow tubes like icicles, while a small transparent petrifying stream trickles down the rock. On the southern frontier extends the plain of Marathon (*fig. 478.*), long and narrow, covered with rich crops of grain; but the traveller looks in vain for the columns, on which were recorded the immortal names of its heroes. The great tumulus or barrow, however, with a bush or two growing on it, still towers above

477

QUARRIES OF PENTELICUS.

in aromatic herbs, still produces, as already observed, the honey for which it was always celebrated. On the southern frontier extends the plain of Marathon (*fig. 478.*), long and narrow, covered with rich crops of grain; but the traveller looks in vain for the columns, on which were recorded the immortal names of its heroes. The great tumulus or barrow, however, with a bush or two growing on it, still towers above

478

TUMULUS AT MARATHON.

the level of the plain. On the north-west extremity of Attica is Eleusis, the seat of those thrice-sacred mysteries in which almost every nation, Greek or barbarian, came in such crowds to be initiated. The mystic temple planned by Ictinus, the architect of the Parthenon, offers only broken fragments to attest its ancient place as one of the grandest edifices of Greece. Opposite to it is the island of Salamis (fig. 479.), separated from the continent by those narrow straits, the scene of that grand naval battle so glorious to Athens, which completely broke the tide of Persian invasion. Its port had been filled up, and the island was occupied merely by a handful of Albanian husbandmen, till the late convulsions, when its situation enabled it to afford shelter to crowds of fugitives from the continent, especially from Boeotia. Mr. Waddington found

ELEUSIS AND SALAMIS.

its population thus raised to 11,500, of whom only 192 were natives; and since that time the calamities of Athens and Ipsara have added to the number. At the opposite or northern extremity of Attica appears the temple of Minerva Sunias, a fabric of white marble, and exquisitely beautiful. It is of the Doric order, of the same style, and seemingly belonging to the same age, as the Parthenon. There are twelve columns still standing, the effect of which is greatly heightened by their position on a steep and lofty cape, whence they look down on the wide expanse of the subject deep, and are visible from afar.

3485. *Megara*, the former capital of the little territory of Megaris, stands on the main route leading from Athens to the Peloponnesus. It is now a collection of mean huts, in which are found only some fragments and inscriptions on the site of its ancient edifices, overgrown with corn.

3486. *The isthmus of Corinth*, four or five miles in width, unites the Morea with the continent. The ancients had built a wall across, of which some vestiges still remain. Corinth itself (fig. 480.) was the most conspicuous object in this part of Greece. It derived great wealth from the fertile surrounding plain, and from the large quantity of merchandise conveyed across the isthmus, to avoid the circumnavigation of the Morea, which

CORINTH.

the ancients dreaded. Preserving its ancient name, it occupies a wide area but thinly filled with houses; and, with the exception of a group of fine Doric columns, few only of those monuments remain which must have adorned it during the days of its splendour. It presents, however, a most distinguished natural object—the citadel or Acrocorinthus, which towers to the height of upwards of 1000 feet, and commands an almost matchless view over the sea and the finest regions of Greece. It is a position of great military strength, “the Gibraltar of the Peloponnesus,” and was well fortified by the Venetians. But the works are considered by Mr. Blaquière as too extended, and they have not maintained that impregnable character to which their aspect seems to entitle them. The villages round Corinth, and even the port, were entirely laid waste during the late severe contest.

3487. *Sicyon*, with its fine plain covered with villages, presents itself as we turn to the right into the Peloponnesus. This ancient seat of Grecian power is now dwindled from its high pre-eminence to become one of the most wretched villages in the Morea. Few traces also remain of the arts, of which this opulent and voluptuous city was considered as the school. The chief is the theatre, which remains almost entire, and appeared to Dr. Clarke to surpass every other in Greece, in the harmony of its proportions, the costliness of its workmanship, the grandeur of the Koilon, and the stupendous prospect presented.

3488. *Argolis*, a more extended plain, to the right of the isthmus, forms a long peninsula parallel to that of Attica. It consists chiefly of a plain, bordered by very high mountains, and of very peculiar beauty. It is divided into delicious valleys covered by cultivated fields, or filled with myrtles, flowering shrubs, and trees, and each of which appears to be secluded from the rest of the world. The shepherds from the mountains are heard playing on their reed pipes, as in the ages of poetic fiction. The cities of Argolis are the most ancient in Greece, and their monuments bear the stamp of the Egyptian and Doric style, marked rather by the stupendous magnitude than by the refinement of art. It was even believed in Greece that they were the work of a Cyclopean race of gigantic stature; a notion, as Dr. Clarke observes, which every nation has entertained respecting its ancestors.

3489. *Mycenæ*, Argos, and Tiryns rank as the most memorable of these antique cities. Mycenæ, the early capital of Greece, and “the proud seat of the king of kings,” still presents specimens, wonderfully entire, of the architecture and sculpture of the heroic ages. Its Acropolis, perhaps the most ancient in the world, has admirably withstood the ravages of time; and its walls, composed of huge unhewn masses of stone fitted to each other, follow the sinuosities of the rock on which it stands. The entrance is by the Gate of the Lions, the same by which “the king of men” issued forth to the conquest of Troy. It is supposed that the two sculptured lions, or rather panthers, which surmount it, were mythological figures, and that the whole edifice possessed the same sacred character which was ascribed to the Acropolis of Athens, and the temples of Egypt. Another monument consists of a tumulus of vast dimensions, which Dr. Clarke has given much reason to think was the actual tomb of Agamemnon. The entrance, built with all the colossal grandeur of Phœnician architecture, is surmounted by a mass of breccia, twenty-seven feet long, said to be the largest slab of hewn stone in the world. All the monuments of Argolis bear an Egyptian character, and Dr. Clarke almost fancied himself again among the ruins of Memphis. Argos itself succeeded Messene as capital of the plain, which place it continued to hold till the late revolution, when Napoli rivalled it. The antiquities of Argos are few, and consist only of terra-cottas and architectural fragments. Dr. Clarke discovered here one of those secret hollow passages from which the oracular responses were delivered by the unseen priest in the name of the god, the sound being heightened by the rocks so as to produce a striking effect. Argos has been, in modern times, a large straggling place, the houses rather commodious, though not well built. The new government had formed there at one time a sort of capital, particularly marked by establishments for education, but according to the most recent accounts, the war had reduced it to a state of almost total desolation; from which, however, it is beginning to revive. The ruins of Tiryns form a still more striking mass than

those of Mycenæ, and carry back the mind into a still more solemn antiquity. The only structures remaining are the walls of the Acropolis, enclosing a space of 244 yards by 54. Their strength is gigantic, however, like that of Hercules, from whom they are named; being twenty-one feet to twenty-five feet thick, and forty-three feet high. As an example of human power, they have been placed in competition with the pyramids of Egypt. These walls existed before Homer, by whom they are celebrated; they have remained entire since his age, and they are likely to brave the attacks of time through a much longer period.

3490. *Nauplia*, which the Venetians have modernised into Napoli, is situated at the head of the Gulf of Argos, and possesses every requisite of a great naval capital. It stands on a long narrow promontory, surrounded by impregnable heights, which would render it, like Corinth, another Gibraltar, were it held by sure defenders. The port, though its depth has diminished, is still the best and most secure in the Morea. It has carried on in modern times a very considerable trade in the export of wine, oil, and sponges; the staples of Argolis, and of the interior Morea. Since the revolution, the Greeks, destitute of any other secure hold, have made it their capital and seat of government. Clarke reckoned it to contain only 2000 inhabitants, but 6000 had just before been carried off by the plague. The number by which it was crowded when Mr. Emerson was there, appeared to be 15,000. The interior is ugly, the streets being, as described by Pausanias, narrow, dark, and dirty; nor is it distinguished by any striking ancient monuments.

3491. *Argolis contains other spots that awaken interesting recollections.* Epidaurus, now Pithauri, is at present only a village, situated in a narrow, but fertile and beautiful vale. Near it, however, the Greeks held their first constituent assembly, to which they gave this classic name. A few miles from it is the grove, held sacred by the ancients as the birthplace of *Æsculapius*; adorned also by the temples of Diana and Venus, and some other edifices. These are now level with the ground, which is strewn with elegant fragments of the Doric and Ionic orders. The theatre is in tolerable preservation; and, though tenanted by hares, partridges, and tortoises, justifies the description of Pausanias, who remarked it as one of the most beautiful in Greece. Darnala, a small but rather thriving village, now covers the site of Træzene, of the ancient ruins of which few fragments remain; but there are numerous churches, which, though mostly dilapidated, mark its importance during the lower ages.

3492. *The high plain of the ancient Arcadia* occupies the centre of the Morea to the west of that of Argolis. This celebrated seat of the pastoral muses presents some rugged and gloomy features. It is traversed and bordered by the steep chains of Mænalus and Lycæus; it is in many parts bleak and marshy; and the cold of winter is somewhat severe. In spring and summer, however, while the lower plains are scorched by the rays of the sun, it enjoys a delicious and salutary coolness; gentle clouds collect among the mountains, and descend in fertilising showers; springs and rivulets without number, descending to form the Alpheus, irrigate the fields; the vine yields abundantly its delicious fruit, and numberless flocks still feed in its valleys and mountain sides. This country was once the chosen seat of poetry and fable. Every forest, every cavern, had its gods and its altars. The woods were inhabited by fauns, and every oak had its dryad. Diana wandered among the groves; the nymphs sported among flowers; the god of the shepherds animated every spot with his presence. Here lingered long, very long, it was said, the innocence and simple manners of the first ages, when they were banished from every other part of the globe. These fond remembrances are still not altogether belied in the more sequestered districts, which continue the abode of peace, where the shepherd enjoys in tranquillity the delights of a pastoral life. The population consists here chiefly of Albanians.

3493. *Tripolizza*, the Turkish capital of the Morea, is situated in the eastern part of this plain, at the foot of Mount Mænalus, and in a region which even the ancients characterised as the abode of winter. Sir W. Gell is surprised that the pacha should have fixed his seat in the only ugly spot of his dominions; a large, dirty, gloomy city, in the most uninviting country, and under the worst possible climate. The Albanians, when they over-ran the Peloponnesus, and cut off here 3000 heads in two hours, raised round it a high and strong wall, which rendered it an important military post, and exposed it to many vicissitudes during the late contest. First, after a long siege it was stormed by the Greeks, who incurred a deep and lasting reproach for the massacre of which they were guilty on this occasion. Afterwards it yielded to the arms of Ibrahim Pacha, and the fortifications suffered so much, that it could no longer stand half an hour's regular siege. The palace of the pacha, a vast wooden building, capable of containing 1200 men, and forming a sort of suburb to the town, has been demolished; and the same fate has been shared by most of the principal houses, which were spacious, but devoid of taste. The four large mosques contain many precious fragments and bas-reliefs, profaned by the barbarous manner in which they are inserted. The Turks have either placed them inside, or covered them over, that their eyes may not be wounded by such profane representations.

3494. *The other cities of the Arcadian plain* present few monuments of their ancient fame; these, indeed, have been demolished by the people of Tripolizza, which, though not itself ancient, has been built out of them. Linano, a miserable collection of clay huts, covers the site of the once proud Megalopolis, which the Theban hero raised into the military capital of Peloponnesus. Only its theatre, the largest in Greece, can still be traced, its seats covered with earth and overgrown with bushes, and a few fragments of its walls facing the Helisson. Pouqueville sought in vain for Mantinée, its eight temples, and the site of the great battle, in which Epaminondas conquered and fell; but Sir W. Gell could trace, in its flat marshy site, the regular circuit of its walls, washed by the Ophis, and the line of some of its streets. Tegea is, as of old, strewn with fragments, and it is conjectured that a rich treasure of ancient sculpture might be found under ground, if it were duly sought. Orchomenos occupied a commanding situation on the flat summit of a steep hill, at the foot of which the modern village is built. There are no remarkable ruins, but some indications of them might tempt the antiquary to undertake an excavation. Cantena, a town of the lower ages, and Dimizance, where the Greeks had founded a school of some eminence, are the chief existing towns in the interior of the Morea. On the coast is Arcadia, a flourishing little port, with 4000 inhabitants; but, notwithstanding the name it bears, it is not an ancient city, nor does it present ancient monuments. Ascending the river of Arcadia, and passing the agreeable village of Sidero Castro, the traveller comes to the remains of Phigalia, once a large city, of which only the circuit of the walls is in any preservation. Near it, however, stands the temple of Apollo Epicurius (*fig. 481.*), by much the best preserved ancient edifice in the Morea, and which was even esteemed second in beauty only to that of Tegea. It is placed in one of the most romantic situations that poetry could imagine, on the ridge of a

hill surrounded by old trees, and in complete solitude. The frieze representing the combats of the fabulous ages has been removed, and deposited in the British Museum. It is curious as a relique of art, but is much eclipsed by the sculptures of the Parthenon, with which it is there confronted.

TEMPLE OF APOLLO EPICURIUS.

481

3495. *The south of the Morea* consists of three peninsulas, formed by the nearly parallel gulfs of Messenia or Coron, and of Kolokythia; the peninsulas of Messenia, of Maina, and of Zaccunia or Laconia. Messenia, oppressed under the iron sway of Sparta, did not possess any important monuments till the time of Epaminondas, who emancipated it from those proud masters. It still displays a noble circuit of walls and gates, the most magnificent in all Greece. On the coast of the peninsula have risen several modern ports of consequence; Navarino, one of the best harbours in the Peloponnesus, in a fine plain, and of considerable strength, though it could not withstand the Egyptian arms; Modon, the ancient Methone; and Coron, on or near the Corone of Epaminondas; neither of which places are now of much consequence.

3496. *The peninsula of Maina* is almost entirely filled with the branches of the rugged Taygetus, which rises from the sea as it were by steps, and shoots up into lofty and snowy pinnacles. Though not so elevated as those of the Alps, they are seen under a bright sky, and display, it is said, especially when viewed from the coast of Laconia, tints more beautiful than on any other European mountains. The rocks are naked, hard, and sharp; and fragments of them are often employed as hones. This rugged region is inhabited by the Mainotes; a Greek race, who, if not genuine descendants of the Spartans, have inherited at least all their hardy spirit. They have ever been the defence of the Greek nation in war, and its scourge in peace. The Mainotes, quite unlike other Greeks, have a bold and manly air, which awes even a Turk. The population is distributed through upwards of 100 villages, ruled by seven or eight capitani, who somewhat resemble the Highland lairds during their fullest period of clannish independence. The Mainotes have all the barbarous virtues; the stranger who trusts to their hospitality finds it boundless, and may pass in safety from one end of Maina to the other. The women, who are uncommonly handsome, and of fair complexion, are much better treated than females are in the rest of Greece or Turkey. They are neither confined nor degraded; and, in return, they distinguish themselves by their conjugal fidelity and active household management; and, not content with the virtues of their own sex, they emulate those of the other; sallying forth at the head of warlike bands, and setting examples of masculine prowess. The weapon of the Mainotes is the rifle, to which they are trained from their infancy, and which they use with matchless dexterity. They are the very best of light mountain troops, in which capacity they have repeatedly cleared the Morea from enemies, and oppressed it themselves. The rocky southern extremity, towards Cape Tænarus or Matapan, is held by the Caconvionotes, a race who seem a sort of caricature of the Mainotes, having all their fierceness, without any of their redeeming qualities. The towns of Maina are little more than villages; of which Dolus, in the interior, containing 500 houses, is said to be the largest. Marathenissi and Kibrees are small sea-ports, the occasional residence of the beys. To the north-west opens the beautiful plain of Calamata, with the large flourishing village of that name, which, though recently destroyed, must in due time revive.

3497. *The third peninsula* contains the country of Isakonia, which seems evidently a corruption of Laconia. Its north-eastern head receives the Eurotas, on whose banks the traveller has to seek for the remains of Lacedæmon. In approaching them his eye is struck by Misitra, a more modern capital, which seems to have arisen under the Greek empire. Misitra, extending by successive stages up the sides of an extensive hill, has a magnificent appearance, and might be taken for the metropolis of a large empire, rather

THEATRE AT SPARTA.

482

than that of the deserted vales of Laconia. The entrance into it produces disappointment; the streets being narrow, winding, and dirty, and presenting no important edifice ancient or modern. At a few miles' distance, however, is traced the site of Sparta, covered with extensive ruins; but these, to our disappointment, are found to be not those of the austere votaries of Lycurgus; they are the "theatre (*fig. 482.*) and other gay structures erected by Rome after Sparta was reduced

to subjection. Only one small building, partly of brick, might be a tomb of one of the ancient kings." Laconia is a long level woodland, from which rise, in romantic and fantastic forms, the summits of Taygetus. It has, however, one important port, Napoli di Malvasia, whence a much esteemed wine is exported, and some other trade is carried on.

3498. *The northern coast*, extending along the Gulf of Lepanto, and comprehending the ancient Elis and Achaia, alone remains to complete the picture of the Morea. It is a very fertile plain, producing the best wine in Greece, and the finest currants in the world. In the classic antiquary it excites the deepest interest, as containing the sites of Elis and Olympia, or rather Pisa, the scenes of those games to which Greece thronged from her remotest valleys, and those sacred precincts, on entering which the most hostile bands deposited their arms. This region was under the protection of Jupiter Olympius, whose statue, 60 feet in height, presented

the utmost perfection of painting and statuary, with every display of wealth which gifts could accumulate. What barbarian hands destroyed Olympia has not been fully ascertained, but the wreck is so complete, that travellers have passed over it, and believed that not a trace existed. Mr. Dodwell, however, was able to identify the grand temple of the Olympian Jupiter, and dug up some fragments of columns, exceeding in dimension those of the Parthenon at Athens. Elis presents only a confused wreck of scattered blocks; but near it is the modern Gastouni, a small town, one of the richest in Peloponnesus, though at this moment also lying in ruin. The modern capital, however, of all this district, is Patras; a large commercial, dirty, ill-built place, with but little of a classic character. It is fortified, and has been held by the Turks during nearly the whole of the present contest.

3499. *The territory beyond the Morea*, along the Gulf of Lepanto, is usually divided at present into Eastern and Western Greece, or Hellas; the former of which represents the ancient Bœotia and Phocis, the latter Ætolia and Acarnania.

3500. *Eastern Hellas* consists of several plains enclosed by very lofty mountains, and above all by those which are most sacred in the annals of poetry, the heights of Helicon, Cithæron, and Parnassus, accounted ever the chosen haunt of the Muses. Dr. Clarke considers their grand aspect and romantic valleys as having had a powerful influence in prompting the high flights of the Grecian muse, and even doubts whether any great poet could spring up on a flat and unvaried champaign. Thebes, in a plain surrounded by these snow-clad summits, makes still a noble appearance; but only some coins and fragments are now to be discovered within the circuit of its walls. It suffered severely in the late contest; prior to which it was a considerable place, of from three to five hundred houses, and has been celebrated for the beauty of its females. Westward is the plain of Plataea, in which the traveller searches for monuments of the splendid victory which finally baffled the power of Xerxes. Dr. Clarke seems, in fact, to have discovered the site of the city, and near it some ancient sepulchres (*fig. 483.*), which may be supposed to have been erected immediately after

483

ANCIENT SARCOPHAGI AT PLATAEA.

that great event. On the opposite side of a ridge of hills is the plain of Leuctra, the scene of that other battle which finally subverted the dominion of Sparta over Greece. The site is still covered with huge masses of marble and stone, which the inhabitants have long laboured to demolish, with the view of introducing the plough; but the attempt has hitherto proved fruitless. Above this plain rises

Helicon, the solitudes of which are in the highest degree beautiful: every declivity of the mountain is covered with luxuriant shrubs, or tenanted by browsing flocks; while the pipe of the shepherd, mingling its sound with that of the bells upon the goats and the sheep, is heard at intervals among the rocks. Dr. Clarke conceived that he could here ascertain the fountains of Aganippe and Helicon, and the Grove of the Muses. Beyond Helicon lies the plain and city of Livadia, the latter of which has been the capital of this part of Greece, and the seat of an extensive jurisdiction. It contained 1500 houses, and carried on a considerable trade in the productions of this part of Greece. Lebadia was said to be as richly adorned with sculptures as any Greek city; but every trace of them has vanished, and it is now only distinguished by the mystic spot of the cave and shrine of Trophonius, and the two streams Mnemosyne and Lethe, Memory and Oblivion, flowing through the former. A

484

CHERONÆA.

few miles westward is the plain of Cheronæa (*fig. 484.*), shut in by Parnassus, with its bleak and rugged masses of grey limestone rock, covered with shrubs and coppice. This was a great battleplain, on which was repeatedly decided the fate of Greece; first through the defeat of the Athenians by the Bœotians, afterwards through that of the combined Greek forces by Philip, and lastly of Mithridates by Sylla. A

most conspicuous tumulus still exists, a monument of the ensanguined field. 3501. *Delphi* (*fig. 485.*), at the foot of Parnassus (*fig. 486.*), is separated by a branch of that mountain from the plain of Cheronæa. This was the most celebrated of the ancient shrines to which mankind went in crowds to be deluded. The temple has disappeared, and its exact site cannot be even conjectured. Its position, however, in a deep circular vale, built along the sides of Parnassus, whose vast precipices rise behind in towering majesty, cannot, independent of all recollection, be viewed without the deepest emotion. The Cyclopean

masonry may still be traced, in which the streets, rising in terraces behind each other, were

DELPHI.

able importance, being considered as the capital and military rendezvous of Western Greece. It communicates with the gulf by its port of Scala. Galaxidi, farther up the gulf, was rising into some importance before the

MOUNT PARNASSUS.

late struggle. But Missolonghi, though of recent origin, has now eclipsed the fame of all the western cities. Its position at the mouth of the gulf had enabled it to rise into some commercial importance. During the late contest, its peninsular site in a shallow sea which admitted only boats, though its only defences on the land side were a low wall and a paltry ditch, inspired the Greeks with the design of converting it into a strong-hold. Missolonghi accordingly made a long and glorious resistance, and became the rallying point for all Greece without the Morea.

3503. *Thessaly* forms an exterior portion of Greece, severed from the rest by the lofty and rugged barrier of Mount Ceta, which runs across the entire breadth, till it locks in with the chain of Pindus. The interior consists of almost boundless plains, formerly celebrated for the manœuvres of the Thessalian cavalry.

It is girdled by mountains still loftier than any yet surveyed: Olympus, the proudest of all the Grecian summits, on which fable and mythology placed the celestial mansion and the throne of Jupiter; Ossa and Pelion, next in magnitude, piled up by the giants who hoped to have scaled heaven. Thessaly is called by Dr. Clarke the Yorkshire of Greece: its rich plains are tolerably cultivated, and it is not even destitute of manufacturing industry. A late observer reckons the population at 700,000. The towns are much more Turkish than in Hellas or the Morea; but the mountains are held by Greek plunderers (*klephtes*), a bold and warlike race, who have made considerable efforts to establish their independence. The entrance into Thessaly from Greece is by one of the most celebrated and sacred spots consecrated by antiquity, the pass of Thermopylæ, which the patriotic devotion of "the three hundred" has stamped with the most sublime recollections. The narrow passage lies between the eastern extremity of Ceta and a marsh reaching to the sea. A tumulus is here discovered, on which appear the broken remains of a massive pedestal, originally formed for supporting, as Dr. Clarke believes, the simple but affecting monument erected to their memory. A filthy quagmire, breathing mephitic exhalations, would render the scene disgusting but for these associations. After passing the considerable town of Zeitouni, the eye opens on the immense plain of Pharsalia, the scene of that mighty contest in which fate gave to Cæsar the empire of the world. Pharsa, or Farsala, is entirely Turkish, and nothing but the name remains to tell what it was. It is, however, a large town, with 2000 houses. This plain is separated only by some low hills from the immense champaign of Larissa, presenting a smooth and flat surface of the finest soil that can be imagined. Larissa is a large city, of 20,000 inhabitants, and presents a magnificent view, from the crowd of its mosques and minarets, which amount to no less than twenty-four. It is thoroughly Turkish, and the populace are imbued with extreme bigotry. Only broken fragments of Corinthian columns are now to be traced, many of the ancient marbles having been barbarously cut down into the forms of Turkish head-dresses, and stuck over the tombs. The shops are numerous and good; and in them may be found ancient silver medals, and also specimens of the Thessalian pottery which almost equal the ancient terracottas. Southward from Larissa tower Olympus, Pelion, and Ossa; the former disposed in vast masses, and with prodigious grandeur. The passage through this formidable chain is by the Vale of Tempe (*fig. 487.*), so celebrated among the ancients for its sequestered and picturesque character. Placed between Olympus on the left and Ossa on the right, it is compared by Dr. Clarke to Dovedale, or to the pass of Killiecrankie, but on a much larger scale. The rocks rise to the most awful perpendicular height, and are tinted with a great variety of hues. At its entrance is the large village of Ampelaka, almost purely Greek, and in which flourishes a manufacture of cotton thread dyed of so beautiful a red, as to have hitherto baffled all competition.

3504. *Macedonia*, beyond Tempe, opens its still vaster plain, the ancient Pieria and Emathia, having on the

made to form a part of the awful features of the mountain. At the foot of a precipice, above which the rock shoots up into two pointed crags, the visiter sees the fountain of Castalia, that grand source of ancient inspiration; and the scene itself combines great picturesque beauty with all the circumstances of local interest. A square shallow basin at its foot was doubtless the Castalian fount in which the priestess was accustomed to plunge before she mounted the tripod, to pronounce the thrice-sacred oracle. Dr. Clarke ascended the summit of Parnassus, which he judged to be one of the highest in Europe, and the prospect from it more striking than from any one of the numerous eminences he had ascended. It overlooked all the mountain tops, except Olympus, which appeared with its many summits clad in shining snow.

3502. *Western Hellas*, the ancient Locris and Ætolia, displays neither the same grand features of nature nor the same ancient magnificence; but it has been distinguished in modern military history. Naupactus, its ancient port, has been modernised into Lepanto, and has given its name to a gulf, which was the grand theatre of naval conflict between the Turks and the Venetians, and of that in which the Spaniards, by a signal victory, finally broke the Turkish maritime power. Salona, on the site of the ancient Amphissa, still retains consider-

south Olympus with its lofty attendant summits, and on the north Scomrus, a branch of the still longer and more awful chains of Hæmus and Rhodope. This plain resembles a crater, characteristic of the limestone

487

VALE OF TEMPE.

lower part of the town, which the former inhabit, and in which business is chiefly carried on, is exposed to frequent ravages of the plague. This city has one very magnificent relic of antiquity in a propylæum, consisting of five magnificent Corinthian columns supporting an entablature. The church of St. Sophia resembles that of Constantinople upon a smaller scale, but is rendered particularly interesting by its fine columns of *verde antico*. Seres is a flourishing inland town, surrounded by the plain most productive in cotton, and supposed to contain 30,000 inhabitants. The ancient capitals of Pella and *Ægæ*, or Edessa, have not yet been successfully explored.

3505. *The islands* form a prominent and interesting appendage to Greece. Cyprus, Rhodes, and a considerable number of smaller isles ranged along the coast of Asia Minor, have been always considered as Asiatic. The Greek European islands are Candia, the Cyclades, and those termed the Ionian Islands.

3506. *Candia* is one of the largest islands in the Mediterranean, being reckoned about 500 miles in circumference: it is of much greater dimension east and west than north and south; and forms, as it were, a base upon which the whole Archipelago rests. It is perhaps more favoured by nature than any other part of Europe. The interior is covered with mountains, of which Mount Ida towers to a very lofty height. The plains and valleys along the sea-coast are covered with myrtle groves, spacious plane trees, and other beautiful woods; and the soil, though merely scratched by a wretched plough drawn by two sorry oxen, yields luxuriant crops of wheat and barley. The olive grows in high perfection; though the oil, for want of care and skill in preparing it, is unfit for the table, and only used for soap and other manufactures. Crete was rendered famous in early antiquity by the laws of Minos, and by institutions of a very peculiar nature founded upon them. During the classic ages it seems to have been far surpassed by the rest of Greece, and the Cretans became even proverbial for slowness of intellect. In the lower ages, it derived great lustre from the noble stand there made by Venice against the Ottoman power, at a moment when it threatened to overwhelm the whole civilised world. The siege of Candia, protracted for twenty-three years, forms one of the most memorable eras in modern history. At length the whole island fell under the Ottoman dominion, and the Turks have occupied it more completely than the Cyclades and the Asiatic islands. The inhabitants are a fine race, and more independent of the Porte than the vassals of most other parts of the empire. The mountains and mountain plains, however, have continued to be occupied by a Greek race called the Sfacciotes, who in these high tracts carry on the trade of shepherd, not altogether uncombined with that of robber. It was by this body that the chief stand was made in the late insurrection, and they had nearly driven the Turks out of the island, when they were forced themselves to yield to the Pacha of Egypt. Candia remains with the Turks.

3507. *Of the towns*, Candia, the capital, has had its harbours choked up with sand, against which the Turks never take any precautions; and the greater part of its trade has passed to Canea. It still bears the trace of a handsome Venetian town, with substantial houses formed into regular streets and squares; but the havoc of its long siege and subsequent desertion give it a very gloomy aspect. Canea, without the name of capital, is populous and flourishing, having 15,000 inhabitants; but with nothing in its aspect to distinguish it from other Turkish towns. Between Canea and Candia is Retimo, a well-built town, situated in a delightful country abounding with olive trees; but its harbour having likewise suffered, Canea has profited in this as in the former instance. Near Candia are heaps of dust and rubbish, which, with the name Cnosson, given to a small village, indicate the ancient Cnosus, the capital of Minos and of the most powerful of the Cretan nations. There are traces still more unequivocal of Gortyna; and near it a rock cut into a complex multiplicity of chambers, which has been supposed to be the famous labyrinth of Crete; but Sonnini is of opinion that it is only a huge quarry.

3508. *The Cyclades*, a numerous and celebrated group, are interposed between Candia and Asia Minor, but nearer to the continent, from which they recede in a south-east direction.

formation, and has the form of a horseshoe; being bounded on the west by Mount Pangæus, and opening on the east to the sea. The finest part is the eastern, particularly round Seres, where three hundred villages are employed in the cultivation of cotton, the staple of the country. Tobacco, distinguished by a peculiar balsamic odour, ranks second in importance. Salonica, the ancient Thessalonica, is now the greatest and most commercial city of Greece, possessing a population of 60,000 or 70,000 inhabitants. It is one of the few remaining cities that have preserved the form of the ancient fortifications, the mural turrets yet standing, and the walls that support them being entire. The city is reckoned by Mr. Walpole to contain 20,000 Jews and 12,000 Greeks. The

Their aspect, bold, rocky, yet richly verdant, presents to the vessels sailing through it scenes of varied beauty. The rocks are of different and sometimes singular composition, embedding the finest marble in the world; and there are many striking indications of that interior heat which breaks forth in earthquakes and volcanoes. Their wines were celebrated in antiquity, and have not altogether lost their reputation. Among the most remarkable of these isles is Paros, whose quarries of precious statuary marble lie now neglected, not a single block having been removed since the dominion of the Turks. It is still easy to see the extreme nicety, and the care to avoid waste, with which each portion was cut out; and from the cavity left, the very destination of the block may be conjectured. The Pentelican marble was of equally original beauty, but it had not that faculty of hardening by exposure to air, and resisting decomposition through a series of ages, which caused the marble of Paros to be at last exclusively adopted in sculpture. The small contiguous island of Antiparos presents a phenomenon the most singular in the world of its kind; a prodigious grotto (*fig. 488.*), or rather series of grottoes, the

488

GROTTO OF ANTIPAROS.

of Naxos is still good, and is consumed in abundance; the emery stone is almost entirely obtained from this island. Delos, so celebrated in ancient mythology as the cradle of Apollo and Diana, and to whose shrines even the people of the East repaired in crowds, is now only a heap of ruins reduced to rubbish. The remains of its temples have unfortunately been resorted to as a quarry, the fragments being formed into those little turbaned pillars which serve as tombstones. Santorini (*fig. 489.*), the ancient Thera, not much noticed in antiquity,

489

COAST OF SANTORINI.

has attracted attention by some extraordinary effects of volcanic action. About a century ago, a new island was seen to arise out of the sea. It was first announced by the emission of a thick smoke, which, spreading over Santorini, destroyed vegetation, discoloured metals, and caused headach and nausea; a long succession of reports ensued, similar to those of cannon or the loudest thunder. Myriads of ignited substances rose like sky-rockets into the air, and fell down in showers of stars. Rocks and fragments were carried to the distance of two miles, and clouds of ashes to that of twenty-five miles. After this series of shocks had continued for a year, the darkness ceased, and there appeared an island five miles round, and about 200 feet at its highest point. There has since been no violent shock, though a subterraneous roaring is still heard, and smoke is seen rising from the rocks and from the

490

TOWN AND ISLAND OF SYRA.

sea. Milo (the ancient Melos, celebrated for its abundance) and Argentera, though not subject to such violent convulsions, exhale perpetual vapours, which were formerly employed for medicinal purposes, but have now rendered them so unhealthy, that they are almost deserted. Syra is a fertile island, the capital of which is singularly arranged along the sides of a conical hill, causing it to resemble a sugar-loaf covered with houses (*fig. 490.*). Skero, the ancient Scyros, Andro, and Tino, are considerable islands, susceptible of great improvement.

3509. *Two islands, Hydra and Spezzia*, though little favoured by nature, and unknown to antiquity, have,

491

TOWN OF HYDRA.

in a singular manner, taken the lead of all the states and islands of Greece. Hydra (*fig. 491.*), a rugged mass of rock, with scarcely a spot of verdure, remained without an inhabitant till Turkish oppression, and the desolations of the Morea, drove a few fishermen to build their huts on its precipitous sides. The same causes in which the settlement originated were favourable to its increase; and as it appeared too insignificant to excite jealousy, it was allowed to compound with the Turks for a moderate tribute, and began that brilliant commercial career, which was opened to it by the influence and concurrence of circumstances already mentioned. It now contains about 40,000 inhabitants, many of whom have attained to considerable wealth, and rule the republic with a sort of aristocratic sway.

The energies of Hydra have been for some time exclusively turned to war, and perhaps she will never regain her former extensive commerce. Spezzia is a sort of outwork of Hydra, with only 3000 inhabitants, yet with somewhat more of cultivation. Sir W. Gell and Mr. Waddington, whose dispositions are not very friendly, represent the population of both as Albanian; but the people themselves do not own the descent; nor does it appear very probable that this fierce race, who have all along been the oppressors of Greece, should have been the foremost in seeking redress for her wrongs.

3510. *The Ionian Islands* is the name given to a range extending chiefly along the coast of Albania. The principal ones are Corfu (the ancient Corcyra), Santa Maura, (formerly Leucadia), Theaki (Ithaca), Cephalonia, Cerigo, celebrated under the ancient name of Cythera, but situated at a considerable distance from the others, off the southern coast of Laconia. These, as detached islands, occupied frequently a conspicuous place in ancient history; but their political union took place in modern times, in consequence of being held by the Venetians, and defended by their navy against the Turks, who had over-run the whole of the adjacent continent. When France, in 1797, seized the territory of Venice, she added these as an appendage to it; and, even after the cession of Venice to Austria, endeavoured still to retain them attached to her, under the title of the Ionian Republic. She was unable, however, to maintain them against the superior naval force of England, which, at the congress of Vienna, was nominated protector of the Ionian Islands. That power has since continued to hold them in full military occupation, and spends 50,000*l.* a year in fortifications and troops. The natives, however, are allowed a great share in the internal government, and even assemble in a regular parliament. These islands, like the opposite coast of Albania, are rocky, rugged, and picturesque, though none of the peaks rise to any great elevation. This surface renders them ill fitted for the cultivation of corn; but wine and fruits, especially the latter, are raised in great perfection. The species of small grapes which, when dried, are called currants, are largely imported into Britain from these islands. Zante produces annually about 60,000 cwt.; Cephalonia about 50,000. The population amounts to about 220,000. Corfu possesses the political pre-eminence; and the capital, containing 16,000 inhabitants, derives great importance from its strong fortifications; but Zante is the most flourishing and industrious: its metropolis, of the same name, containing 22,000 inhabitants, is the largest town in the islands.

Negropont may here be mentioned; a long island separated by a narrow channel from Attica. It is diversified by rugged mountains and fertile valleys. It is supposed to contain about 60,000 people; and its capital, 16,000. It is attached to the Greek state.

CHAP. XVIII.

TURKEY IN EUROPE.

3511. *Turkey in Europe* forms the western and metropolitan part of that extensive and once mighty empire which subverted and superseded the eastern branch of the empire of Rome. The most extensive portion, in which perhaps its main strength is seated, belongs to Asia. In describing Greece, we have comprised much of what has hitherto been, and it is to be feared must still, to a great extent, be, Turkish territory. There remains under the head of European Turkey a comparatively small portion of the empire; but, as it contains the capital and the seat of government, it will afford the proper occasion for taking a general survey of the power, resources, and character of the whole.

SECT. I. *General Outline and Aspect.*

3512. *Turkey, as to site and boundaries*, forms the most eastern part of the territory of southern Europe, and the link which connects that continent with Asia. It also unites the Mediterranean with the Black Sea, being almost enclosed by their various bays and branches, and by that long range of straits, the Dardanelles, the Sea of Marmora, and the channel of Constantinople, by which these two great seas communicate. On the southern side it has an inland boundary bordering on Austria and on Russia. The Danube forms here the limit of the central Turkish provinces, and, with the fortresses on its banks, has been the main barrier of the empire; but beyond it are the fiercely disputed tributary provinces of Moldavia and Wallachia, which carry the frontier to the Pruth and the Carpathian mountains. The boundary on the side of Greece is still somewhat uncertain; and it may, on the whole, be difficult to estimate the general dimensions of this dominion.

3513. *The mountains of European Turkey* consist chiefly of that extensive and formidable range called by the ancients Hæmus and Rhodope; by the Turks Balkan, Despoto Dag, Argentari; a continuous chain, stretching from the head of the Adriatic to the Black Sea. It separates Turkey into several very fine and fruitful plains; that of Roumelia in the south, and on the north those of Bulgaria, Bosnia, and Servia, ranging along the Danube. Beyond that river are the vast watery plains of Moldavia and Wallachia.

3514. *The greatest river of Europe*, swelled to its utmost magnitude, rolls along the whole border of European Turkey. From the barbarism of the government, however, and the hostile relations with the neighbouring powers, the Danube serves very little for the conveyance of merchandise; it is more famed in the dreadful annals of war than in the peaceful records of commerce.

SECT. II. *Natural Geography.*

SUBJECT. 1. *Geology.*

3515. *The Geology of this country* is similar to that of Hungary.

SUBJECT. 2. *Botany.*

3516. *Turkey, inclusive of Greece.* The two countries now specified can scarcely be considered separately, when treating of their botanical productions. The northern parts, however, lying in the same latitude with a great portion of Italy, and the south of Germany and Russia, though comparatively but little known, may be expected to contain a vegetation very similar to that of those countries. Greece, and the isles of the Archipelago, in a more southern latitude, under a clear sky, tempered by the waters of the Mediterranean, present a different vegetation, approaching that of Syria and Asia Minor; and our attention will be principally confined to those which, so renowned in history, and so admirably illustrated in

their topography, are yet but imperfectly known to naturalists. The learned Tournefort, indeed, visited the islands, and Dr. Sibthorpe both the islands and the peninsula; but many of the botanical acquisitions of the former are only known by his Herbarium, and his famous drawings, called *Vélins du Muséum*, which exist in the Jardin des Plantes at Paris; while the splendid *Flora Græca* of the latter traveller, edited by the late Sir J. E. Smith, is still far from being completed; and among that portion which is published, however valuable to the man of science and the scholar, there is but little which can interest the general reader.

493

NARCISSUS TAZETTA.

The illustration of the writings of Dioscorides was Dr. Sibthorpe's chief object. The names and reputed virtues of several plants recorded by that ancient author, and still traditionally retained by the Athenian shepherds, served occasionally to elucidate or to confirm his synonymy. The first sketch of the *Flora Græca* comprises about 850 species. This, however, the author observes, "may be considered as containing only the plants, observed by me, in the environs of Athens, on the snowy heights of that Grecian Alp, Mount Parnassus, on the steep precipices of Delphis, the empurpled mountains of Hymettus, the Pentele, the lower hills about the Piræus, the olive-grounds surrounding Athens, and the fertile plains of Bœotia." The author made a second tour in Greece; and in February, 1795, he visited the Morea. The Violet and the Primrose welcomed him in the vales of Arcadia, and the Narcissus Tazetta (fig. 493.), which Dr. Sibthorpe was inclined to think the true Narcissus of the poets, decorated in profusion the banks of the Alpheus. The barbarian hordes, under whose escort he was obliged to travel, had taste enough to collect nosegays of these flowers.

The Oaks of the Arcadian mountains presented him with the true ancient misseltree (*Loranthus europæus*) (fig. 494.), which still serves to make birdlime, whilst the misseltree of our

494

LORANTHUS EUROPEUS.

country is, in Greece, seen only on the Silver Fir. The Jay, still called by its classical name Κεσσα, was screaming among these oaks, and the Water Ouzel (*Sturnus Cinclus*), flying along the rocky sides of the alpine rivulets of Arcadia, presented itself to Dr. Sibthorpe's recollection as probably the White Blackbird mentioned by Aristotle as peculiar to the neighbourhood of Mount Cyllene. But in vain did our classical traveller look for the beauty of the Arcadian shepherdesses, or listen for the pipe of the sylvan swain. Figures emaciated, and features furrowed with poverty, labour, and care, were all that he met with. Taygetus, the highest mountain in the Morea, and almost rivalling Parnassus, was ascended by Dr.

Sibthorpe; but the quantity of snow, and the great distance, prevented him and his fellow-travellers from reaching the summit. Panagioti, nephew of the cheriff, and a popular character, accompanied him with fifty of his followers, and displayed his botanical knowledge by showing Dr. Sibthorpe the Darnel, still called *aipa*, among the corn, which he said occasioned dizziness; and also a wonderful root, the top of which is used as an emetic, and the bottom as a purge. This proved to be the Euphorbia Apios, to which the very same properties were attributed by Dioscorides.*

3517. *Greece is very mountainous.* The summits of the chain of Pindus are variously estimated at 8400 or 9000 feet. Be the height what it may, it is certain that snow remains the whole year on

"Pindus' inland peak,
Robed half in mist, bedew'd with snowy rills,
Array'd in many a dun and purple streak."

The most southern plains are not protected from the frosts. In the Peloponnesus, near Tripolizza, the thermometer, in January, falls to 8° or 9° (Reaumur) below zero. Still, in the peninsula, snow is rare, and of short duration, except on the very elevated situations, where it lies unmelted till the return of spring. Undoubtedly there are peculiar causes that influence the climate of Tripolizza, since the Peloponnesus produces abundantly the Orange, Lemon, and even the Prickly Fig, which latter is as sensible to cold as the Date Palm. This thorny plant, which is so common in Palestine and on the Mediterranean shores of Africa, forms strong defensive hedges in the plains of Mecenia. The Date does not seem to inhabit Peloponnesus; a few trees of it which grow near Athens, are perhaps the only individuals in all continental Greece. On the eastern coast, Orange and Lemon trees grow as far inland as Bœotia, Potidæa, and Thessaly, and even to Mount Olympus,

* See Smith's Life of Sibthorpe, in Rees's *Cyclopædia*.

which divides Macedonia from Thessaly. This is probably the limit of those trees; at least there is nothing to attest their growth in Macedonia and Thrace, whose soil, intersected by mountains, and swept by violent north winds, is mostly covered with such forests as characterise the temperate zone. Hawkins, the celebrated traveller, who visited the lovely vale of "fair Tempe," situated to the south of Mount Olympus, and who has given a list of the trees that it produces, does not mention the Orange and Lemon. They assuredly grow in the island of Lemnos, in the same latitude; but Sibthorpe remarks that the climate is there too cool to ripen their fruit. The Olive succeeds on the coasts of Macedonia, 41° N.

3518. *To judge by vegetation*, the western shores are warmer than the eastern. Near Epirus, between 39° and 40° , precisely in the same latitude as the Vale of Tempe, Corfu, which is celebrated for its fertility, produces both the Prickly Fig and the Date.

3519. *The vegetables peculiar to the transition zone* pass from Epirus into the Illyrian provinces. The Olive and Myrtle, the Orange and Lemon, adorn the romantic rocks that skirt the mouth of the Cattaro and the coasts of the Gulf of Guarnero. The two latter do not go beyond: — the Olive, Myrtle, and Laurel, with *Quercus coccifera*, *Ilex*, and *Ægilops*, the Oriental Hornbeam (*Carpinus orientalis*), the Manna Ash (*Fraxinus Ornus*), the Stone Pine (*Pinus Pinea*), the *Osyris alba*, the Terebinth tree and Caper bush, skirt the shores so far as the extremity of the Adriatic. But this vegetation wholly ceases at a short distance from the coast, to give place to the peculiar growth of the temperate zone.

3520. *Greece exhibits but few of the larger species of the transition zone*: these are found in the Mediterranean countries of Asia, Africa, and Europe. The most common and remarkable trees and shrubs, from Cape Matapan to Mount Olympus on the east, and as far as the southern frontiers of Dalmatia on the west, are, on the plains and hills, the Olive, the shrubby Jasmine (*Jasminum fruticans*), *Phillyræa media* and *angustifolia*, *Styrax officinale*, the Strawberry tree (*Arbutus Unedo*) and *A. Andrachne*, the Myrtle and Pomegranate, the Cherry Laurel and Locust tree (*Cercis Siliquastrum*), the Pistachio (*Pistacia Lentiscus*), and *P. Terebinthus*, *Zizyphus vulgaris*, and Christ's thorn, *Paliurus australis*, *Rhamnus Alaternus*, the Caper bush, *Acer monspessulanum*, the Sweet Bay (*Laurus nobilis*), *Osyris alba*, the Fig (*Ficus Carica*), *Celtis australis*, the White and Black Poplars, and the Aspen; *Populus pyramidalis* and *atheniensis*, the Cypress and Stone Pine, the Juniper and Savin, and *Juniperus macrocarpa*, several species of *Cistus*, &c. On the banks of running waters and in damp spots are the Oriental Plane, *Salix monandra* and *triandra*, *viminalis* and *capræa*, the White, the Weeping, and Crack Willows, the Alder, the Chaste tree (*Vitex Agnus castus*), and the Oleander. On the sea coast, the Pinaster and Stone Pine, *Quercus Ægilops*, &c. The mountains produce *Abies taxifolia*, the Beech and *Salix retusa* (these three grow in the highest regions), the Scotch Fir, the Yew, the common Oak, *Ostrya vulgaris*, the Ash and Chestnut (the latter species on the spots of moderate elevation), the Hazel and *Corylus Columna*, the Ash, the flat-leaved Lime (*Tilia platyphyllos*), the Horsechestnut, the Service tree and Mountain Ash, the Wild Apple and Pear trees, *Pyrus Aria* and *torminalis*, the *Ilex*, *Quercus Ballota* and *Q. coccifera*, these three species preferring the low valleys and plains.

3521. *The Chaste tree* (*Vitex Agnus castus*), the Terebinth (*Pistacia Terebinthus*), the Shrubby Jasmine, Myrtle, Fig, Olive, Pomegranate, &c. overshadow the hills of Istria.

3522. *The Cypress*, *Ilex*, *Quercus coccifera* and *Ægilops*, *Ostrya vulgaris*, the Oriental Hornbeam, Flowering Ash, Stone Pine, and Caper bush, the *Rhus Cotinus*, *Osyris alba*, *Juniperus Oxycedrus* and Sweet Bay, with many of the plants, both annual and perennial, that belong to the flora of the Mediterranean, grow in the environs of Fiume and Trieste.

3523. *It is remarkable that Juniperus macrocarpa*, *Quercus Ægilops*, *Corylus Columna*, *Populus atheniensis*, the Weeping Willow, *Arbutus Andrachne*, the Horsechestnut, the Wild Cherry and Cherry Laurel, the common Almond and Pomegranate, which are indigenous in Greece and Asia Minor, have never been found wild to the west of the Adriatic.

3524. *A few of the plants now enumerated*, with some others peculiar to the "Isles of Greece," deserve a more particular notice. Tournefort says, that, except Pinks and July-flowers, we have no fine flowers but what came originally from the Levant. Tuberoses, Hyacinths, Narcissuses, and Irises are derived from that country, and, above all, the Ranunculus and Tulip; and though these may have been natives of the Asiatic border, it is certain that most of them were introduced to our gardens through the medium of Constantinople. The latter formed so important an article of trade in northern Europe, that a single bulb has sold for a sum equal to 500 guineas. Holland now yields us our best Hyacinths and Ranunculuses, rectified, as Tournefort calls it, by the culture of the industrious Dutch. The Turks have long been attached to these flowers, and it was the Vizier Kara Mustapha, who "miscarried before Vienna in 1683, that is said to have brought the latter plant (*Ranunculus asiaticus*) (fig. 495.) into fashion. In order to amuse his master, Mahomet IV., who extremely loved hunting, privacy, and solitude, he insensibly inspired him with a fancy for flowers; and understanding that the Ranunculuses were what he most admired, he wrote to all the bashaws throughout the empire, to send him roots and

seeds of the finest sorts they could lay hands upon. The chiefs of Candia, Cyprus, Rhodes

RANUNCULUS ASIATICUS.

Aleppo, Damascus, outdid all the others in thus paying their court to him. Thence came those admirable species of *Ranunculus*, which are to be seen in the fine gardens of Constantinople and Paris. The seeds which were sent to the vizier, and those propagated by private men, produced vast varieties. The ambassadors prided themselves on sending them to their respective masters, and in Europe they were improved by culture. M. Malaval contributed not a little thereto at Marseilles: he furnished France with them, and all foreign countries." The Anemone of

ANEMONE HORTENSIS.

our gardens (*A. hortensis*) (fig. 496.) abounds in the islands. In the spring, Milo and the rest of the islands of the Archipelago are covered, says Tournefort, like a carpet, thick set,

POTERIUM SPINOSUM.

and as it were studded, with anemones of all colours: they are single, yet from their seeds come the most splendid varieties that are seen in our parterres. "But," continues the same author, "of all the rare plants growing in Milo, the prickly Pimpernel, or prickly shrubby Burnet (*Poterium spinosum*) (fig. 497.), was that which pleased us most: we had met with it before in Candia; but I could not persuade myself that this plant, which requires great care to raise in our gardens, could be so common in the Archipelago. It is an under-shrub, called in vulgar Greek *Stæbida*: be-

DIANTHUS ARBOREUS.

sides the resemblance of its name, it answers in its virtues to the *Stæbe* of Dioscorides. The prickly Pimpernel is of marvellous use in these islands, towards multiplying the pasturages, and transforming, as it were, the heaths into meadows. In August, when it blows north, and the plant is dried up, they set fire to the foot of it; in an instant the wind carries the flames far and wide, even to the very mountains. The first autumn rains that fall fetch out an excellent herbage from these burnt lands, and this much sooner than in France, because it never freezes in this island, and very rarely snows." The Isle of Serphis, and a few other islands, alone produce the beautiful arborescent Pink (*Dianthus arboreus*) (fig. 498.), the discovery of which seems to have delighted Tournefort more than almost any other circum-

CISTUS CRETICUS.

stance in the whole course of his travels.

He introduced it to the Royal Gardens at Paris, where it maintained its honour, he tells us, amidst an infinite number of scarce plants from the same country.

3525. *Gum Ladanum* is the produce of a very handsome species of *Cistus*, well known in our gardens, the *C. creticus* (fig. 499.), the *Ledon* of Dioscorides, in whose time the gum that exuded from the glands of the leaves was obtained by driving goats in among the shrubs, or by these animals naturally browsing upon them, when the substance adheres to their hair and beards. Now that this substance is collected to supply a more extended commerce, a

peculiar instrument (fig. 500.) is employed for the purpose, which is figured and described by Tournefort, and the accuracy of which is attested by Sieber, in his *Voyage to Crete*.

INSTRUMENT FOR COLLECTING THE GUM LADANUM.

"It is a kind of rake, with a double row of long leathern straps. It was in the heat of the day, and not a breath of wind stirring; circumstances necessary to the gathering of Ladanum. Seven or eight country fellows, in their shirts and drawers, were brushing the plants with their whips; the straps whereof, by rubbing against the leaves of this shrub, licked up a sort of odoriferous glue, sticking on the leaves: this is part of the nutritious juice of the plant, which sweats through the texture of those leaves like a fatty dew, in shining drops, as clear as turpentine. When the whips are sufficiently laden with this grease, they take a knife and scrape it clean off the straps, and make it up into a mass or cakes of different size: this is what comes to us, under the name of *Ladanum* or *Labdanum*. A man who is diligent will gather 3 lbs. per day or more, which they sell for a crown on the spot: this sort of work is rather unpleasant than laborious, because it must be done in the sultry time of the day, and in the deadest calm; and yet the purest Ladanum cannot be obtained free from filth, because the winds of the preceding day have blown dust upon the shrubs." About 50 cwt. of it is annually collected in Crete, and sent exclusively to Constantinople.

3526. *Gum Tragacanth* is a no less important article of trade than Gum Ladanum, and appears to be the produce, not only of the *Astragalus Tragacantha* (fig. 501.) and *A. creticus* (fig. 502.), but of others of the same genus, which form a group, distinguished by their permanent leaf-stalks, which eventually become spinescent. Tournefort describes the Cretan

501

ASTRAGALUS TRAGACANTHA.

202

ASTRAGALUS CRETICUS.

plant, and figures a specimen, in his *Voyage to the Levant*. "We had the pleasure," says he, "of leisurely examining the Gum Tragacanth upon Mount Ida. It appears naturally in the close of June and in the following months. During that time, the nourishing juice of this plant, thickened by the heat, bursts the greater part of the vessels that contain it. It not only accumulates in the heart of the stems and branches, but in the interstices of the fibres, which are disposed in rays. This sap coagulates in filaments, as in the pores of the bark; and these filaments, striking through the bark, gradually work their way out, as they are pushed forward by the new moisture that the roots afford. On exposure to the air, the substance becomes hardened, and forms either lumps or twisted laminæ, similar to worms of various lengths, according to the quantity of sap; it even seems that the contraction of the fibres of this plant contributes to the expression of the Gum Tragacanth. These fibres, disentangled like hemp, being pulled and trodden by the feet of shepherds and of horses, shrink up with heat, and facilitate the issuing of the extravasated juice." Sieber, however, in his Cretan voyage, tells us he could not learn that the Cretan Astragal (*Astragalus creticus*) produced any Gum Tragacanth. On Mount Lebanon, Tragacanth, we know, is yielded by the *Astragalus gummifera* of La Billardière, who, however, observes, contrary to the remarks of Tournefort, that it is not during the great heats of the day that this substance flows, but during the night, and a little after sunrise; and he even thinks that a cloudy atmosphere, or a heavy dew, is necessary for its production; and states that the shepherds of Lebanon only go in search of this substance when the mountain has been covered during the night with thick clouds.

503

JUNIPERUS LYCIA.

3527. Those kinds of wood which we consider among the most precious are burnt by the Greeks for fuel. In Amorgos they consume nothing but Mastich and the Cypress-leaved Cedar (*Juniperus lycia*) (fig. 503.) which produces Olibanum. The Greeks make use of this latter in their fishing excursions. At the stern of the galley they have a sort of grating into which the wood is put, broken into small pieces. In the night it is set fire to; and while the fish are following the boat, attracted by the light, they strike at them with a trident or three-forked javelin. This

wood is not, however, the produce of Amorgos, which is destitute of trees, but is brought from the adjoining island. In the town of Crete, you may see bundles of wood for firing of the most fragrant description. "Nothing is used," says Sieber, "but Sage, Thyme, Cistus, Cypress wood (fig. 504.), Marjoram, and Lavender; and it is, indeed, a delightful country,

CUPRESSUS SEMPERVIRENS.

504

where not only the air is scented with the balsamic odour of the numerous aromatic plants, especially after a shower of rain, but where the very smoke is perfumed with the fragrance of the wood of which their fires are made."

3528. The *Mastich* and *Terebinth* are gum-resins, for which the island of Scio is especially celebrated. The former is the product of the *Pistacia Lentiscus* (fig. 505.). Olivier says that "Mastich must be considered as one of the most important and valuable productions of the island, since the inhabitants of Scio owe to it a part of

PISTACIA LENTISCUS.

505

their privileges, and the cultivators much of their independence and comfort. The *Lentiscus* which yields it no way differs from that which grows in the south of Europe and all the islands of the Archipelago, but from which no *Mastich* can be procured. Some slight varieties may be seen at Scio, with leaves of a greater or less size, which are owing to culture, and perpetuated by grafts and layers.

3529. "In order to obtain the *Mastich*, it is customary to make slight and numerous incisions in the trunk and principal branches, from the 15th to the 20th of July, according to the Greek calendar. From these clefts a liquid juice insensibly trickles, which hardens by degrees, and remains attached to the tree in drops of greater or less size, and sometimes even falls on the ground. The first is the most esteemed, and is removed with a sharp iron instrument, half an inch broad at the extremity. Frequently a cloth is spread beneath the tree, that the *Mastich* may not be impregnated with dust and dirt. According to regulations made on the subject, the first gathering cannot take place before the 27th of August. It lasts eight consecutive days, and fresh incisions are made up to the 25th of September, when a new harvest takes place, which again occupies eight days. After that period the trees are not cut again; but until the 19th of November, the *Mastich* that continues to flow is collected on the Monday and Tuesday of every week; and it is forbidden after that period to gather any.

3530. "A curious experiment, which deserves to be generally known, came to my hearing. As it is forbidden to cultivate the *Lentiscus* beyond the limits prescribed by government, a Turk, hoping to evade the law, and still obtain the *Mastich*, grafted some *Lentisk* plants on young *Terebinths*. They took perfectly well, but the man was surprised, some years after, to find that from the incisions he had made, a substance exuded, which combined the odour and qualities of *Mastich* with the fluidity of *Terebinth*. *Mastich* is collected in twenty-one villages, situated to the south of the town; and the quantity amounts, on an average, to rather more than 125,000 lbs. 45,000 lbs. belong to the Aga, who farms the article; and they are paid to him by the cultivators as a tax for the permission of growing it. The surplus brings them in about 50 paras for 2½ lbs. (rather less than a shilling), and they are forbidden, under very heavy penalties, to sell it to any one but the contractor. The best and finest quality is sent to Constantinople, for the use of the grand signior's palace. The second sort goes to Cairo, and passes into the harams of the Mamelukes; while merchants only obtain a mixture of the second and third qualities."

3531. It is hardly possible that the quantity of *Mastich* afforded by the island of Scio can supply the great consumption of this article in Turkey and in Europe. A traveller, indeed, assured Olivier that the *Lentiscus* is cultivated in the interior of Natolia. Throughout the Ottoman empire, it is an universal practice for all the women, even the Franks, to chew *Mastich* almost incessantly. It softens in the mouth, to which it imparts an agreeable fragrance, while it strengthens the gums and whitens the teeth. It is also used for fumigation and perfumes; as a remedy for various diseases, and to give a pleasant flavour to bread.

3532. The *Terebinth* flows naturally in summer from clefts in the bark of another species

of Pistacia, the *P. Terebinthus* (fig. 506.)

506

PISTACIA TEREBINTHUS.

It is at first liquid, and of a bluish, greenish, or yellowish white; but soon becomes hard and dry on exposure to the air. It is commonly called Scian Terebinth, being principally grown in that island. But its flow is facilitated by the incisions which the natives make, every spring, in the trunk and branches of the tree. Every morning, after the coolness of night has condensed it, this substance is collected with a spatula, from the trunks of the trees, and the flat stones that are laid expressly to receive it. As the gum, thus obtained, is always mixed with some extraneous matter, it is purified by being run through small baskets, after having been liquefied by exposure to the sun.

3533. The *Terebinth* trees afford but little gum in proportion to their size; for an individual 60 years old, and with a trunk four or five feet in circumference, yields but ten or eleven ounces annually. As a natural consequence, the *Terebinth* is very expensive, even in the country where it is produced. Part is consumed in the Levant, and the rest carried to Venice, where it is generally adulterated with turpentine, called Venetian Terebinth. Thus the true tere-

binth of Scio is hardly ever to be obtained pure: that which is really so may be known by its thickness, and by possessing a more agreeable odour than the turpentine of the spruce and other fir trees; it is also destitute of bitterness and acidity.

3534. A species of *Cynips*, which deposits its eggs on the branches of the terebinth, occasions galls and large excrescences, containing a small portion of a very limpid and odoriferous resin.

3535. The *Ferula* of the ancients, the *vapθηξ* of Dioscorides, is an umbelliferous plant, allied to the *Assafœtida*, which is equally one of the Fennels, and referred by most authors to the *F. communis*; while Tournefort, who describes it in the island of Skinosa, where it is still called *Nartheca*, says:—"It bears a stalk five feet high, three inches thick: at every ten inches there is a knot, branched at each knot, covered with a hard bark two lines thick: the hollow of this stalk is full of white marrow, which, being well dried, takes fire like a match: this fire holds a good while, and consumes the marrow very gently, without damaging the bark, which makes them use this plant in carrying from one place to another: our sailors laid in a good store of it. This custom is of the greatest antiquity, and may help to explain a passage in Hesiod, who, speaking of the fire that Prometheus stole from heaven, says that he brought it in a ferula. The foundation of this fable doubtless proceeds from Prometheus being the inventor of the steel that strikes fire from the flint. In all probability Prometheus made use of the pith of the ferula instead of a match, and taught men how to preserve fire in the stalks of this plant. The stem is strong enough to be leaned upon, but too light to hurt in striking; and, therefore, Bacchus, one of the greatest legislators of antiquity, wisely ordained the first men that drank wine to make use of this plant, because, being heated with excessive drinking, they would often break one another's heads with the ordinary canes. The priests of the same deity supported themselves on these stalks when they walked; and Pliny observes that this plant is greedily eaten by asses, though to other beasts of burthen it is rank poison. We could not try the truth of this observation, there being nothing but sheep and goats on the island. The plant is now used for making low stools: they take the dried stalks, and by placing them alternately in length and breadth, they form them into cubes, fastened at the four corners with pegs of wood. These cubes are the visiting-stools of the ladies of Amorgos. What a different use is this from that the ancients put the ferula to! Plutarch and Strabo take notice that Alexander kept Homer's works enclosed in a casket of ferula, on account of its lightness: the body of the casket was made of this plant, and then covered with some rich stuff or skin, set off with ribs of gold, and adorned with pearls and precious stones."

3536. Many of the islands are celebrated for their wine—

"Fill high the cup with Samian wine,
Leave battles to the Turkish hordes,
And shed the blood of Scio's vine."

The former isle was chiefly famed for its Muscadine, notwithstanding that Strabo was ravished with every individual thing in it, *except the wine*; but "belike," says Tournefort, "he never tasted the Muscadine wine; or, perhaps, they never bethought themselves then of making any." Naxos had two fables related of it, that the women are brought to bed at the end of eight months, and that there flows a spring of wine in the island. The wines of Greece are in common use throughout Italy. They have been celebrated, indeed, from the remotest antiquity. The ancient medals represented garlands of ivy, interwoven with bunches of grapes. The wines, according to Tournefort, have just tartness enough to qualify their lusciousness; and the lusciousness, far from being fulsome, is attended with that

delicious balm, which, in those who have tasted the Candian wines, begets a contempt for all other wines whatever. Jupiter never drank any other nectar when he reigned king of this island. The Turks cannot forbear this tempting juice, at least in the night-time, and then they make clear work. The Greeks drink it night and day, without water, and in small draughts, happy that they can thus bury the remembrance of their misery. When water is poured on these wines, the glass looks as if it were full of clouds, shot through with fluctuating curling threads, occasioned by the great quantity of ethereal oil which predominates in this delicious liquid.

3537. *Malmsey, or Malvoisie*, so called from the village of Malwisi in that island, was for a long time the produce of Crete; and it was such a favourite with the Italians, that they have a proverb, signifying that it is "manna to the mouth, and balsam to the brain." Sieber witnessed the process of making it in Crete, and describes the annual benediction of the wine, when it is lodged in the spacious cellars of the monastery of Arcadi*:—"Lord God! thou who lovest mankind, direct thine eyes to this wine, and on those who shall drink it: bless our vessels, thrice blessed, as the wells of Jacob and the pool of Siloam, and as thou hast blessed this drink of the Apostles. O Lord, thou who wast present at the wedding of Cana, and, by changing the water into wine, revealed thy glory to thy disciples, send now thy Holy Spirit on this wine, and bless it in thy name!"

3538. *The botanist* need not be told that the *currants* of commerce are the produce of a species of vine; though among the unskilled in natural history an opinion prevails that they are garden currants in a dried state. They are, in fact, small grapes, the berries of a vine; but it is to be lamented that of what species authors are not agreed. They derive their name from having been first brought from Corinth; and as they are seedless, Linnæus considered them a variety of the common Vine (*Vitis vinifera*), and called it *β Corinthiaca apyrena*. Dr. Sibthorpe brought a living plant, supposed to be of this kind, from the ruins of Corinth, with no small trouble and care; but his ignorant gardener threw it away. Sir James E. Smith doubts whether the "*Zante Currant*," which is cultivated at Kew and in some other curious gardens, and is a native of that island, pre-eminently styled, for its beauty, —

"*Zante, fior di Levante*," —

be the same plant as yields the currants of commerce.

SUBJECT. 3. Zoology.

3539. *The native zoology of Turkey* is unquestionably less known than that of many far distant regions, inhabited by savages or barbarians. The baneful spirit of Mahometanism, shown in the besotted ignorance of its followers, who even pride themselves on their contempt

PELICAN.

for knowledge, is the curse of every nation which has been condemned to bend beneath its galling yoke. No part of Europe is more calculated to interest the philosophic zoologist than the provinces of European Turkey, and no part has been so completely unexplored. Our ideas, therefore, of its native zoology can only be formed from analogy. Situated in the most genial climate, abounding in lofty chains of mountains, rich and majestic forests, fruitful plains, and noble rivers, with its shores bathed by the Mediterranean Sea, we may conjecture that many animals now

rarely seen in more populous and civilised countries here enjoy their native range; and others may probably exist, still unknown to science. The proximity, also, of Western and Minor Asia, and the lofty chain of Caucasus, that cradle of the human race, renders it highly probable that European Turkey is that "border country" where the two great zoological provinces of Europe and Asia meet, and blend into each other. That the semi-barbaric despots who have so long held this fair portion of Europe in the fetters of ignorance, and paralysed the minds of millions, may soon be driven to the deserts of their ancestors, must be the unanimous wish of every friend to the human race.

WALLACHIAN SHEEP.

3540. *Among the birds* are found several of those wading species, more common to the warm shores of Africa. That singular bird the European or Pink-coloured Flamingo is a frequent visiter to the salt-water pools and marshes, accompanied by the Pelican (*fig. 507.*) and many other waterfowl; and the stork builds unmolested on the magnificent ruins of the ancient temples.

3541. *The domesticated animals are better known.* The horses, originally brought from the

* Built on the site of the ruins of Arcadia.

neighbouring shores of Egypt and Arabia, and still replenished by constant intercourse with those countries, are naturally fine. The cattle are very large, furnished with ample horns, and are apparently of the same breed as those of southern Italy. The Wallachian sheep (*fig.* 508.) have long been celebrated for the singularity of their horns: they diverge almost at right angles from the head, are very long, and are spirally twisted: this breed, which is white, is derived from the Cretan, and in form resembles the old unimproved breed of England; but the wool, though curling, is rather coarse, and it is straight on the thighs and tail. The superstition of the Turks leads them to abhor pigs. The Turkish greyhound, though well formed, is a disgusting little animal, from the skin being almost destitute of hair.

SECT. III. *Historical Geography.*

3542. *The Turks, or Toorks*, are a numerous race, whose original seat was in the high central regions of Tartary, to the north and east of the Jaxartes, and along the border of the Altaï. Their large and handsome persons, and their fair and ruddy complexions, distinguish them from the meagre, diminutive, and almost deformed aspect of the Mongols, the other ruling Tartar race. In the tenth century, having subdued all their neighbours, they were attracted by the rich and beautiful regions of the south, and poured down through Khorassan into Persia.

3543. *The princes of the Seljuk dynasty* had, at the above period, established full sway over Persia. Thence they crossed the Euphrates, to attack the weakened power of the Greek empire and the Saracen princes. They were triumphant; and established in Asia Minor what was called the kingdom of Roum, while other chiefs over-ran Syria and the Holy Land. At this time the whole of Western Asia was subject to Turkish dynasties. But their fall was preparing. The outrages, of which their rude bands were guilty, formed one of the chief motives which impelled the European powers to the great enterprise of the crusades. The Latin nations poured in with a force which the Turks were unable to withstand; and the thrones of Jerusalem and Iconium were speedily subverted. At the same time, the Mongols, under Zingis, having achieved the subjugation of Tartary, followed the traces of the Turks, wrested from them Persia, and subverted the caliphate. At the end of the thirteenth century, the once proud dynasties of Seljuk were reduced to a number of scattered chieftains, occupying the mountainous districts and high plains of Asia Minor, and obliged to own the supremacy of the Mongol khans of Persia.

3544. *Othman, or Ottoman*, one of their chiefs, was the man who, in 1299, erecting an independent standard, founded the mighty Ottoman empire. He appeared first under the aspect of a Scythian chief, a leader of shepherds and bandits; but first conquering and then uniting under his standard a number of neighbouring tribes, he assembled a formidable military force. His successor, Orchan, having taken Prusa, erected it into a capital, which almost defied the imperial metropolis Constantinople. His successors continually augmented their force by the peculiar institutions under which they trained to arms the captive youth of the conquered countries. They continued to make acquisitions from the decrepid Greek empire, until the walls of Constantinople enclosed all that remained of the dominion of the Cæsars.

3545. *The Turkish empire was raised to its greatest height* by the capture of Constantinople, in 1453, by Mahomet II. The power of the Turks now struck terror into all Europe. In the succeeding century they subdued Egypt, the Barbary States, and all the Arabian coast on the Red Sea. In Europe they rendered tributary the Crimea and the countries along the Danube; they over-ran Hungary and Transylvania, and repeatedly laid siege to Vienna. When affairs came to that crisis, however, the European states took the alarm, and all the princes of Poland and Germany united against the invader, who was repeatedly driven back with prodigious loss. At sea, notwithstanding the gallant resistance of the Venetians and the knights of St. John, the Turks long carried all before them: they subdued Rhodes, Cyprus, and all the Greek islands; and it was only at the little rock of Malta that their progress received a check.

3546. *The decline of the Ottoman power* was perceptible in the course of the seventeenth century, and proceeded rapidly in the eighteenth. The rigour of that discipline, by which they had rendered themselves so formidable, was insensibly relaxed; the grand signior resigned himself to the luxuries and indulgences of the seraglio; and the revolts of the pachas in every quarter distracted the empire. When the European powers began to make war with regular armies, they easily repelled those tumultuary bands which followed the Turkish standard. Above all, when Russia began to develop her gigantic energies, the star of Ottoman ascendancy rapidly declined. Defeated in every battle, losing several of their finest provinces, and holding the rest by a precarious tenure, the Turks ceased to be formidable. In the last war, indeed, General Diebitsch entered Adrianople, and saw the road to the capital open; though peace was then granted on moderate terms. But Turkey has since undergone a still deeper humiliation, having seen her empire almost subverted by Ibrahim, son to the pacha of Egypt, when she was saved only by the interposition of Russia, her mortal enemy, and obliged to sacrifice Syria and Palestine, two of the finest portions of her territory.

SECT. IV. Political Geography.

3547. The Turkish political system has no analogy with that of any other European power, but is formed upon a purely Asiatic model. Its principle is the subjection of the whole administration, civil, military, and religious, to the absolute disposal of one man. The grand signior (fig. 509.), the "shadow of God," and "refuge of the world," is considered

GRAND SIGNIOR.

as reigning by divine commission, and uniting in himself all the powers, legislative, executive, judicial, and ecclesiastical. Selim I., by the conquest of Egypt, acquired a right to the title of caliph; but sultan, or grand signior, is that by which the ruler of Turkey is best known. So deeply rooted is the veneration for the Othman family, that, amid so many bloody and violent revolutions, the idea has never been entertained of a subject seating himself on the imperial throne; and after cutting off the head of one sultan, nothing has ever been dreamt of but raising the next heir to the throne. Under the Mussulman system, the spiritual and temporal powers being considered as essentially one, a peculiarly sacred character is communicated to him in whom they centre. According to profound Mahometan doctors, nothing that the sultan does can be morally wrong. It is at least generally understood that he is entitled to kill, wantonly, fourteen persons in the day, without incurring blame; nor is it, according to Rycaut, till he begins to kill at the rate of

a thousand a day that the people acquire the right of deposing him. He is considered also the proprietor of all the lands in his dominions, excepting those dedicated to pious uses.

3548. The vizier (fig. 510.), assisted by the divan, is the person upon whom devolves entire the exclusive power of the state. The grand signior does not even, like some other Oriental despots, make a show of sitting in judgment, but delegates that function also to his minister; who, thus invested with the authority of supreme magistrate, appoints to all civil and military offices, puts to death all who oppose his measures, and commands the army in person, leaving at court in his absence a pacha, under the title of *caimacan*.

GRAND VIZIER.

He is also accustomed to go disguised through the city, to examine the weights, measures, and qualities of the goods; and, on discovering any deficiency, to apply the bastinado, nail the offender by the ear to the door of his shop, or even strike off his head. The divan consisted formerly of six pachas of three tails; but of late it has been formed of the principal state officers: the two *cadi askers*, or judges of the army; the *kiaia bey*, who forms a sort of *reis effendi* (fig. 511.), an officer combining the functions of chancellor with those of secretary of state both for the home and foreign departments; the *tefterdar effendi*, or general

treasurer of the empire; the *tchelebi effendi*, a sort of naval secretary; the *capitan pacha* (fig. 512.), or lord high admiral. In general, there is no exact correspondence between the functions in this and in a European court or ministry; a circumstance from which confusion is often apt to arise.

3549. The *muftis*, and *ulema*, or body of *mollahs*, form the depository of the laws of the empire, and the only class who approach to the character of a national council. They are not, as has sometimes been supposed, ministers of religion; though, since the Koran and its commentaries form the only law of the empire, and the *mollahs* receive their education in the *nadresses*, or colleges attached to the mosques, they bear quite a sacred character. The *mufti*

REIS EFFENDI.

CAPITAN PACHA.

MUFTI.

(fig. 513.) is the second person of the empire in dignity ; he girds the sabre on the sultan, an act equivalent to coronation ; and the sovereign advances seven steps to meet him, while he advances only three towards the grand vizier. No great measure of state can be regularly taken, or command the respect of the empire, without a fetwa from the mufti. The sultan cannot behead him ; and though Murad IV. sought to evade this statute by pounding him in a mortar, the interpretation was scarcely considered sound, and has not been followed. The sultan, however, in case of high cause of wrath, possesses, or at least exercises, the power of deposing the mufti, and thus secures in general his strict subserviency ; though at other times that officer, by placing himself at the head of popular discontents, has been the means of bringing the sovereign to an untimely end. The members of the ulema ought to be elected by the mufti, after strict examination, and with some regard to hereditary claim ; but the grand signior is in the habit of nominating upon his own authority, and from pure favour.

3550. *Justice is administered by members of the ulema* : those in the large towns are termed *mollahs*, and in the smaller towns *cadis* ; the nominations being made by the sultan from a list presented by the mufti. The proceedings are conducted with the greatest simplicity. At the *divan hanneh*, or vizier's tribunal, there is a written statement of the case, which must however be comprised in a page, leaving room for the sentence at the bottom. The parties then plead ; two or three witnesses are examined on each side ; and the decision is given on the spot. Justice is thus neither costly nor tedious, but it is venal. Few judges are inaccessible to a bribe ; and false witnesses are more numerous, and more shameless, than in almost any other country. After all, Turk against Turk has a tolerable chance ; but those beyond the pale of the faith afford a mine of wealth to true believers, who, in opening a process against them, are almost certain to gain something.

3551. *The court and seraglio form not only the most brilliant appendage to the Ottoman Porte, but one of the great moving springs of its political action.* In this palace, or prison, are immured 500 or 600 females, the most beautiful that can be found in the neighbouring realms of Europe, Asia, and Africa ; wherever Turks can rule or Tartars ravage. The pachas and tributary princes vie with each other in gifts of this nature, which form the most effective mode of gaining imperial favour. Into these recesses only short and stolen glances have been cast by Europeans ; but their reports attest a splendour like that which is celebrated in the Arabian tales : the walls and ceilings are of olive or walnut wood, curiously carved, richly gilded, and often inlaid with mother-of-pearl, ivory, and porcelain ; the floors spread with the richest Persian carpets. The sultan, however, does not marry, judging his place too high to admit any one to such an equality. From the multitude of beauties, however, he selects seven, who are called *kadunis* or favourites, while the remaining crowd are confounded under the appellation of *odalisques*, or slaves. The number seven cannot be exceeded ; but when a vacancy is wanted, it can be effected by removing one of them to the old seraglio, a dignified retirement, which receives also the favourites of the prince immediately on his death. These imprisoned beauties are guarded by numerous bands of unfortunate slaves reduced to the state of eunuchs. The gates and outer apartments are guarded by white eunuchs ; but black eunuchs, rendered safe by their deformity, are stationed in all the interior recesses. Many of these personages rise to great distinction, and the *kislar aga* (fig. 514.), their chief, is one of the leading characters in the empire, and even a sort of head of

514

KISLAR AGA.

the church. In another palace are reared a great body of *ichoglans*, or pages, trained in all graceful exercises, for the purpose of personal attendance on the sultan. They are often raised to high offices of state, though in that capacity they are viewed with utter contempt by the hardy chiefs who have forced their way by merit and services. Another class of eminent characters in this court consists of the mutes. A Turkish grandee, lolling on his sofa, requires incessant attendance : his pipe, sherbet, and slippers must be at any moment handed to him or to his guests ; he must therefore have some one before whom he can speak without reserve, and without fear of his secrets being made public ; but many, to reach such high employments, feign themselves to be labouring under these infirmities. Dwarfs, by a taste which seems common to uncultivated minds, are also favourites ; and when any individual unites the perfections of being deaf and dumb, and a dwarf, he becomes one to whom the highest value is attached.

3552. *The finances of the empire are shrouded in very deep mystery ; indeed, their amount cannot be in any degree measured by that of the sums paid into the treasury.* The lands held as the sole property of the sultan are let out on the tenure of military service ; and thus is defrayed the whole expense of the troops, with the exception of the janissaries. By a similar assignment of land the mosques and all other public establishments are supported ; and the sultana mother is, by the same arrangement, enabled to maintain the state belonging to her rank. The numerous princesses are bestowed in marriage on the pachas and other

opulent individuals, who find this honour dearly purchased by the mortifications which they are doomed to endure from the haughtiness of these imperial spouses. Of the direct contribution the principal is the *haratsh*, or capitation tax, imposed on all subjects of the empire who are not Mahometan. It has varied extremely; the present statutory amount is ten, six, or three piastres, according to the different gradations of supposed wealth in the contributors; but there is much that is arbitrary and oppressive in the actual levy of this impost. In the subject provinces of Moldavia and Wallachia, the *haratsh* is paid in one sum by the princes or vaivodes; but both from them and from the pachas his imperial majesty is pleased to accept of numerous presents on various occasions, to say nothing of those which it is at least highly prudent to make to the officers of state and the occupants of the haram. Hence it was calculated that where the tribute was only 65,000 piastres, the presents exceeded 500,000. In short, all the offices of the empire are regularly put up to sale. Forfeiture and confiscation form also an extensive source of revenue, independently of the principle by which the sovereign is held the legal heir of all who die in his service. The customs are considerable, being levied by farm, without much rigour; but the attempts to establish an excise have been met by violent discontents, and even insurrection. One most pernicious resource is that of the monopoly of grain. It is very difficult to say what sums of money actually enter the *miri*, or imperial treasury. De Tott and Cantemir make an estimate of 3,900,000*l.*, which is probably nearer the truth than that of Olivier, who makes it upwards of 6,000,000*l.*

3553. *The military system of the Turks*, formerly the terror of the greatest powers in Europe, and now despised by almost the meanest, has undergone no formal change. It is supported on a basis somewhat resembling the feudal militia, though without any thing of an hereditary character. All the lands are distributed, in portions of 300 acres and upwards, among the *zaims* and *timariots*, on condition that they bring into the field, and support at their own cost, a number of horsemen proportioned to the extent of their lots. The number of *timars* and *zaimets* are stated at 50,160; and the collective force which they ought to bring into the field at 150,000. The troops are, however, bound to keep to their standards only between the days of St. George and St. Demetrius; that is, between the middle of April and the middle of October. The above are termed the *toprakli*, or feudatory troops; the rest are the *capiculi*, or paid troops, who alone approximate to the cha-

JANISSARY.

racter of a regular force. Of these last, the chief have hitherto been the *janissaries* (*fig. 515.*), who for a long period might be said to hold at their disposal the Ottoman empire; and their *aga* was one of its greatest officers (*fig. 516.*). They originated in a peculiar policy of the first sultans, who, selecting the most vigorous of the young captives, trained them up in the Mahometan religion, and in all the exercises fitting them for war. They were afterwards, however, recruited out of the Mussulman population, many of whom even so-

JANISSARY AGHA.

licitated a nominal admission, with a view to the privileges and exemptions attached to the order. The number on the list was thus very great; but according to Mr. Thornton, the actual issue of pay, at the daily rate of threepence, implies only a force of 40,000. Recently, however, this powerful body has been annihilated by the vigorous and bloody measures of Mahmoud, the reigning sultan, who is using the utmost exertion to organise a new force similar to that maintained by the other European powers. There is also a paid force of *spahis*, or cavalry, amounting to 15,000. Of this limited amount, a great proportion is required for the body-guard of the sultan and pachas, and for the police; so that the field-armies of the Turks consist almost entirely of the *toprakli*, or feudatories, a huge tumultuary mass, resembling the armies of Europe during the feudal ages. Their order of encampment has been compared to a number of coins taken in the hand and scattered over a table; and their march resembles the career of the volcano, desolating every spot over which they pass: as they advance, the inhabitants flee to the mountains, and secrete all their most valuable effects. The Turkish soldiery make merely one vigorous push against the enemy, and if this fails they are discouraged, disperse, and return to their homes. Upon such a system, they cannot, in modern times, at all match in the field regular armies. It would be rash, however, to infer, from the poor figure they have made in all the late wars, that the Turkish empire would fall an easy prey to an invader. It has many defensive resources. The Turks have an excellent light cavalry; they skirmish well, and defend fortresses with great obstinacy; and in extremity the grand signior can summon to arms the whole mass of the population, who

are not slow to obey the call whenever impelled by any national motive, such as would be the invasion of the empire by an infidel army.

3554. *The rayahs, or tributary subjects of the empire*, form a class subjected to a peculiar system of policy. The propagation of the Koran by the sword is a fundamental principle of the Mahometan faith, and death inflicted on the infidel is esteemed the surest passport into paradise. To justify this slaughter, however, it is necessary that there should be resistance; and not to strike off the heads that bend, has become an established maxim. But the utmost boon which the vanquished *giaour* can hope is, that his life may be spared: his person, his property, his all, belong to the votaries of the true faith. An indiscriminate spoil was at first made; but policy afterwards dictated to the sovereign the plan of commuting these indefinite claims for the fixed tribute or capitation called *haratsh*, which, with exclusion from all offices of trust and power, formed the only legal penalties. Of course, however, in such a government, various detached acts of oppression and extortion would be committed, against which the despised and abhorred Christian would in vain protest. The Greeks had three high offices to which they might aspire; that of princes of Moldavia and Wallachia, and of *dragoman* or interpreter; but these were all in the gift of the Porte; and the intrigues by which they were to be sought served still more to degrade the Greek character. Yet, even under this imperfect protection, the nation, being left in the exclusive possession of many industrious and lucrative occupations, insensibly accumulated a degree of wealth which raised them to importance, and excited that desire of independence which has produced such striking effects.

SECT. V. *Productive Industry.*

3555. *Agriculture, in European Turkey*, is depressed at once by arbitrary exactions, and by the devastation consequent on frequent wars in many of the finest provinces; yet its productions are valuable. The grain, which grows in the plains of Roumelia, Bulgaria, and on the banks of the Danube, is considered the finest in the empire. From the same plains a great quantity of excellent butter and bad cheese is obtained, the latter being made of skimmed milk. The steep sides and deep valleys of Hæmus and Rhodope are covered with vast flocks of sheep, affording the most delicate mutton, but a coarse kind of wool, which, however, from its plenty, forms a large article of export. Buffaloes are chiefly employed in agriculture; and, though their flesh is unpalatable, their skins, being thick and strong, are of considerable value. Hare skins, also, are so abundant as to form an article of importance in commerce. Bees innumerable are reared, and yield a profusion of honey and wax. A fine white silk is produced in Bulgaria and the plain of Adrianople, but not equal to that of Bursa. Cotton flourishes in the plains south of Hæmus, though nowhere so copiously as in Macedonia and Thessaly.

3556. *Manufactures* are still in a less flourishing state; yet the very fine one of Turkey leather has been carried to the highest perfection at Gallipoli, and some other places along the Dardanelles, as well as in several cities of Asia Minor. Olivier vainly enquired into the secret of its preparation, which is still hid from Europeans; he could not even ascertain whether it lay in the excellence of the leather, or in the mode of dressing and dyeing. Adrianople fabricates a fine cotton thread, similar to that of Larissa, by which it is now surpassed. Mr. Thornton praises the printed muslins of Constantinople. Turkey carpets belong to Asia Minor, where manufacturing industry is generally more advanced than in European Turkey.

3557. *The commerce* of this part of the empire, excluding Greece, is almost confined to Constantinople. Perhaps no city was ever better situated for trade, either by land or sea; but the proud indolence of the Turks, altogether averse from such occupation, reduced it to a secondary rank; it is therefore confined to the tributary races, and to Frank merchants at Constantinople, acting under great difficulty and restraint. From Constantinople would be exported a good deal of grain, were it not for the impolitic prohibition, which does not however prevent a considerable contraband trade. Other productions of European and Asiatic Turkey, wool, buffalo hides, skins, goats' hair, Turkey leather, wax, drugs, silk, cotton, and copper, find their chief vent through the capital. The pride of the Orientals, and their peculiar habits, render them little dependent on imports from the West. Nevertheless, the European merchants contrive to introduce some cottons and sugar, also coffee from the West Indies, under the disguise of Mocha, together with glass, porcelain, and other brilliant fabrics for the ornament of the haram. From the Black Sea and the Caspian are brought slaves in great numbers, also a vast quantity of salt-fish and caviare, which are required for the Greek fasts. Before the revolutionary war, the intercourse with the West was chiefly maintained by Marseilles and Leghorn; but when their flags could not appear on the Mediterranean, the mercantile marine of the Greeks carried on all the traffic of the Levant. In the present state of confusion, it is difficult to say either what are, or what are likely to be, the channels of this commerce.

3558. *The roads*, as usual in absolute monarchies, are supported by the government, the

pachas having assignments upon the national domains for that purpose. The grand military routes are thus maintained in tolerable order; but the by-paths are greatly neglected. We are not aware that canals have ever entered into the plans of Turkish improvement. /

SECT. VI. *Civil and Social State.*

3559. *The national character and aspect* of the Turk is thoroughly Oriental, and in every point contrary to that of the Western European nations. All the external forms of life are dissimilar, and even opposite. The men, instead of our dresses fitted tight to the body, wear long flowing robes, which conceal the limbs. Instead of standing or sitting on chairs, they remain stretched on sofas in luxurious indolence; considering it madness to stir or walk, unless for special purposes or business. They sit cross-legged, especially at meals. On entering a house, they take off, not their hat, but their shoes; in eating, they use the fingers only, without knife or fork; they sleep not on beds, but on couches on the ground. The females, excluded from all society, remain shut up in the haram, and must not be seen or named by any person of the opposite sex. The grave, secluded, and serious cast, impressed by a despotic government and by the Mahometan law, is more decided in the Turk than in the Arab or Persian: he is "a solemn solitary being." The abject submission to a master, which is esteemed a religious duty, is combined with the pride of a conquering people, and with the consciousness of being surrounded by subject races on whom he has set his foot. The deportment of the Turk to the rayah is that of the Teutonic baron towards his humblest domestic vassal. Yet, though this fancied superiority prompts to acts of tyranny and injustice to this numerous class, it seems to inspire a sense of personal dignity, which raises him above the system of falsehood and deceit which is, as it were, rooted elsewhere throughout the East. Compared with other Orientals, the Turk is honest, and his word may be trusted. From this combination of the slave and the aristocrat in circumstances of a political nature, of austerity and licentiousness in religion, the character of the Turks exhibits many striking contrasts. "We find them," says Thornton, "brave and pusillanimous; good and ferocious; firm and weak; active and indolent; passing from austere devotion to disgusting obscenity; from moral severity to gross sensuality; fastidiously delicate and coarsely voluptuous; seated on a celestial bed and preying on garbage. The great are alternately haughty and humble; arrogant and cringing; liberal and sordid. Though the Turk be naturally sedate and placid, his rage, when once roused, is furious and ungovernable, like that of a brute." Hospitality and giving of alms are Oriental virtues. Every grandee keeps a sort of open table; and the fragments of the feast are distributed to the poor at the door. It is rare to hinder any one from plucking herbs or fruit in a garden or orchard. This humanity is even injudiciously extended to the lower creation, which enjoy at Constantinople a sort of paradise. The dogs, though excluded as unclean from the houses and mosques, are allowed to multiply in the streets till they become a perfect nuisance; the doves feed at liberty on the grain in the harbour, which echoes with the crowded clang of unmolested sea-birds.

3560. *The religion of Mahomet* is considered to be preserved throughout this empire in a state of peculiar and exclusive purity. The Turk is imbued from his earliest infancy with the loftiest conceptions of his own spiritual state, and with a mingled hatred and contempt of every other. This feeling is entertained, not only towards the "infidel," but still more deeply towards the Persian *Schiite*, whose tenets respecting the person of Ali are so detested, that, according to the soundest doctors, it is as meritorious to kill one *Schiite* as twenty Christians. The chief observances of their religion consists in the *namaz*, or prayer, repeated five times a day, preceded by ablution, and accompanied by prostrations; and in the observance of the fast of *Ramadan*, when during a whole month neither solid food nor liquid is tasted before sunset. The mosques have certain officers attached to them; as the *muezzin*, who, from the top of the highest minaret, calls the neighbourhood to prayers; the *sheiks* and *kialibs*, who preach and read; the *imam*, who has the general care of the mosque, and, in the villages, performs alone all the other sacred duties. These functionaries are not distinguished from the rest of the citizens either by habits or deportment; and it is remarkable that there is not an office of religion which may not be regularly performed without a priest, either by the magistrate or by private individuals. The sultan, as grand imam, or head of the church, devolves the duties of this character on inferior officers; and most especially on the *kislar aga*, or chief of the black eunuchs, who, by a singular arrangement, is entrusted with the superintendence of all the mosques. It has been said, that sound belief and the strict observance of the above ceremonies are considered as securing paradise, without the necessity of repentance or of good works. Busbequius even counts it as the peculiar felicity of a Mussulman to believe "that nothing can be wrong which he wishes to do, and nothing right which he does not wish." But this seems to be going too far. We find the disuse of wine, the giving of alms, and the founding of caravanseras, practised on a great scale, from religious motives. The first of these is a good deal evaded; yet religion has certainly effected the general substitution of coffee, opium, and tobacco, though even the last is not considered rigidly orthodox. Predestination is celebrated as a Mahometan tenet, and is indeed ever in

their mouth. "It is written," is the resigned comment with which they meet the most severe calamities, and even death itself. Yet, as they take the same anxious and even inordinate care to avoid these evils as others, the dogma perhaps is rather in their mouths than in their hearts; and the formidable valour which, in the career of their victories, was attributed to it, no longer stands in need of such a solution. There are institutions which, though not ordained by Mahomet, have become essential branches of the present system. Such are the *dervishes*, a body who seek, by fantastic displays of self-denial, and contempt of the outward decencies of life, to acquire the reputation of superior sanctity. The most eminent are the howling dervishes, who scream out the name of God till they foam at the mouth and fall to the ground quite exhausted. In one sect the zealots founded their fame upon getting all their teeth drawn out; but it has not made much progress. The belief in charms, sorcery, magic, and the evil eye, was condemned by the precepts of Mahomet; but as this censure was contrary to the spirit of an ignorant and superstitious people, it has not taken effect, and these particulars continue to form an essential part of the popular creed in Mahometan countries.

3561. *The learning of the Turks* may be comprised within a very limited compass. The torrent of their barbarous invasion buried under it not only the splendid though corrupted remains of Greek science, but that of a secondary description which was attained by the Arabs under the caliphate. Yet some of the early sultans were patrons of learning; as, indeed, most conquerors have been. Among these was Orchan, who founded at Bursa a highly celebrated academy; and Mahomet II., whom Western Europe regards as a ferocious tyrant, but who in the East is almost as celebrated for his learning and love of learning as for his victories. It cannot be said that even now learning is left absolutely without encouragement. *Madresses* richly endowed are attached to every mosque, and in them a long and laborious course of study is provided for those who aspire to form part of the ulema. Ten degrees are conferred by these madresses, and the student is often forty years old before he can attain the highest, that of Suleymanieh. The misfortune is, that the studies there pursued have no tendency to enlarge the mind, or to adapt it for the duties of active life. They consist of the rhetoric and logic of the dark ages; of discussions respecting the comparative merits of Abubekir and Omar; and of knotty theological questions, such as, whether the feet, at rising, should be washed with water, or only be rubbed with the bare hand. The Turks are ignorant of the most common instruments in natural philosophy, the telescope, the microscope, the electrical machine, which, if presented to them, are merely shown as objects of childish curiosity. Persons of the highest rank scarcely know any thing of countries beyond the boundaries of the empire. Astrology, so long exploded from the list of European sciences, continues in Turkey to influence and direct the public councils. No expedition sails from Constantinople, no foundation of a building is laid, nor public officer installed, until the *munedjem bachi*, or chief of the astrologers, has named the fortunate day. With all their pride, they are obliged to have recourse to Christian physicians, whose skill they ascribe to necromancy, and who they therefore expect will predict at once, in the most precise manner, the issue of their complaints. All the arts have degenerated into mechanical trades. Neither architecture, painting, nor music is practised with any degree of taste or genius.

3562. *The condition of the female sex* in Turkey is particularly foreign to our manners and ideas. From the moment of marriage they are immured in the haram, excluded from the view of the public and of all of the opposite sex, their nearest relations being alone admitted on occasions of peculiar ceremony. This circumscribed existence, and the necessity of sharing with a multitude of rivals the favour of a husband, or rather master, appear intolerable to European ideas. It is not, however, without compensations, though it seems a great extravagance in Lady M. W. Montagu to allege, respecting Turkish females, that they are the only free women on earth. They are allowed to visit and receive visits, and to frequent the baths; ablution being even obligatory in a religious view; and there they meet with numbers of their own sex. Europeans have not failed to surmise that opportunities are thus taken to elude the vigilance of their guardians, and that the bars of the haram are of little avail. Other well-informed writers doubt if intrigues, which can be carried on only at the hazard of life, and with numerous accomplices, can be very frequent. The advances, in such cases, are always made by the lady, who likewise arranges the mode of meeting, provided the gentleman be willing to risk his head in the adventure. It can admit of less doubt that, by the channels already named, all the news of the city finds its way into the haram, and that gossip is carried on there as busily as in any European coterie. Here also favours are solicited through the channel of female relations, and the haram becomes often the centre of intrigues by which the empire is shaken. Peculiar veneration is attached in Turkey to the parental character, and particularly to that of mother. Even in the fall of a great man, his haram is always respected, and the property belonging to his wives is left untouched, so that they sometimes become his support. Marriage in Turkey has nothing sacred; it is merely a civil contract, fixing the amount of the dower, and perhaps limiting the husband as to the number of his other wives. If the iman be present

along with the *cadi*, he is only a legal witness. Those, with respect to whom there is no such contract, rank as concubines, who are chiefly purchased slaves. In Constantinople there is a bazaar; a vast square building, with an interior court, "where man does not blush to expose to sale the most lovely and interesting part of the creation." Infidels are excluded, on account of the dreaded influence of their evil eye; yet French travellers, who have caught some stolen glances, report that the captives were seen seated upon mats, with their legs crossed, in groupes of fifteen. Pouqueville did not observe in these fair sufferers any sense of their dismal situation; they were chatting with the utmost volubility, laughing and singing: but Olivier, in the group which he saw, observed one who was overwhelmed with the deepest affliction. The children of concubines are considered as legitimate. Polygamy is permitted by law, and carried sometimes to a vast extent, but only by the rich. The poor, and even others who study domestic quiet, find one wife quite sufficient. Divorce is permitted, but is not common. Disagreement of temper does not bear so hard on the husband, from the separate state in which he lives; adultery is avenged by the poniard; so that sterility, reckoned so deadly a curse throughout the East, is the prevailing motive for divorce.

3563. *The rayahs, or subject infidels*, who form so large a part of the population of Turkey, are chiefly Greeks, Jews, and Armenians. The Greeks have been largely noticed, in treating of their native district. The Jews, exposed to every insult, are more degraded, both as to character and state, than in Europe. They carry on banking; usury, at enormous rates; and various small trades, despised by others, by which a penny can be turned; and are alleged to have few scruples on any thing by which their gains may be augmented. The Armenians carry on almost all the inland trade of the empire, particularly in Asia; and are an industrious, frugal, sober, and not very dishonest race. According to Pouqueville, the Turk, when he deigns to trade, sells with the air of conferring a favour; the Greek, artful and active, is eloquent in setting forth his commodities, appealing to heaven for their value and his own probity; the Armenian establishes his speculations with coolness and reflection, his eye always fixed on the future; while the Jew buys, sells, offers his agency in business, and is all activity, all attention; nor can the uniform contempt and aversion with which he is treated ever repel his assiduities.

3564. *The amusements of the Turk* are chiefly domestic. His delight is to give himself up to continued and unvaried reverie; to glide down the stream of time without thought or anxiety; to retire under the shade of trees, there to muse without any fixed object, and to inhale through the pipe a gently inebriating vapour. Stretched in luxurious ease, he takes pleasure, however, in listening to the narrative of the professed story-teller, or in viewing the dances of Greek youths or Turkish *balladières*, at which, though by no means remarkable for decorum, he even allows the presence of his wives. The ball, the theatre, the crowded party, all that in Europe can be accounted gaiety, are utterly foreign to Turkish manners.

3565. *The dress of the Turks* consists of long, loose robes, which do not encumber their stately walk, though they would be incompatible with running or rapid motion. The absence of all those bandages and ligatures by which Europeans are shackled must be highly favourable to the developement of form, and even to health. The turban is the most characteristic feature of Eastern dress; and its varied form and ornaments not only discriminate the rich from the poor, but afford a badge to the various professions, to each of which a costume is appointed by government, and strictly enforced.

3566. *The food of the Turks* is not very luxurious. It consists chiefly of stews and hashes, particularly that favourite one called *pilau*, with salads, olives, and sweetmeats. In wine, though prohibited by their religion, some sultans and great men have deeply indulged; but in general its use is confined to the lowest ranks. Coffee and sherbet are handed about on all occasions. Opium, as a substitute for wine, is taken to excess, and often fatally; those addicted to it usually fall victims before the age of forty.

SECT. VII. *Local Geography.*

3567. *Turkey in Europe*, when we have excluded Greece, may be divided into Roumelia, or that great plain, south of Hæmus and Rhodope, known to the ancients as Thrace; and into Bulgaria, the northern plain between that chain and the Danube. The rest of the territory consists of tributary Christian states, which are ruled by Christian princes nominated by the Porte, and vacillate between independence, devastation, and subjection.

3568. *Roumelia* has been made to include all continental Greece to the frontier of Albania; but, in the present restricted sense it forms a large plain, fertile in grain, fruits, silk, and cotton; while numerous flocks and herds cover the hanging sides of the mountains. It forms the central and metropolitan province of the empire, almost exclusively held by a Turkish population, and including the two great capitals Constantinople and Adrianople.

3569. *Constantinople* (*fig. 517.*) occupies perhaps the most commanding and important site of any city in the world. Mistress of the long chain of straits connecting the two great seas which separate Europe from Asia, it forms the link between those continents. Hence, even while Thrace was steeped in barbarism, Byzantium flourished as a great commercial

republic, until the period when Constantine raised it to higher importance by giving to it his name, and making it the capital of his empire. Even after the separation of the West,

517

CONSTANTINOPLE.

it continued the metropolis of the East, and rose in importance during the encroachments on its territory by the invading tribes. As the world was overwhelmed with the prodigious inundation of the barbarians, Constantinople became the refuge of all that remained of ancient science and civilisation. Reduced by Mahomet II., it became the capital of Moslem ignorance and superstition; yet it still continues one of the greatest cities in Europe, ranking next to London and Paris. The population, in the absence of any kind of census, can be little more than conjectured. Mr. Eton gives the lowest estimate, which is 300,000. It is argued that Constantinople stands on somewhat less ground than Paris, that the houses are not so high, and there are larger gardens; but it must be remembered that the lower classes in the East pack together in a manner of which Europeans have scarcely an idea. Olivier, from the quantity of corn consumed, infers that the inhabitants exceed half a million; and we should not be surprised if strict investigation gave even a greater number; though it seems wonderful that Mr. Thornton should have mentioned a million of rayahs as a possible amount. Constantinople, unlike other European capitals, derives little support from the residence of any great landed proprietors or capitalists, for whom indeed it has few attractions. It rests almost entirely upon the support of those employed by the government, or soliciting from it favours and offices; and Olivier calculates that 8,000,000*l.* sterling are poured in from the provinces, which affords certainly a very ample income. We must add, however, the commercial class, and the remains of the Greek aristocracy, who are established in a quarter called the Fanar, and thence denominated Fanariots.

3570. *The situation of Constantinople* is as beautiful and superb as it is commodious. Seated on the Bosphorus, at the point where it communicates with the Propontis or Sea of Marmora, it is connected both with the Mediterranean and the Black Sea by a succession of straits, easily defensible, yet navigable for the largest vessels. The port is spacious and admirable. On the side of Europe and on that of Asia rich plains spread before the eye, bounded by the snowy tops of Hæmus and Olympus. The city itself, rising on seven hills, along the shore of the Bosphorus, embosomed in groves, from amid which numerous gilded domes ascend to a lofty height, presents a most magnificent spectacle. But the moment the interior is entered, all the magic scene disappears. The streets are narrow, winding, ill paved, and crowded; the houses low and gloomy; and the hills, which appeared majestic in the view, causing steep ascents and descents, prove excessively inconvenient. But the most fatal circumstance in the structure of Constantinople is, that the houses of rich and poor are alike entirely composed of wood, while chimneys are not generally used, but their place supplied by vessels of brass or earth put under the feet. These circumstances, joined to the usual improvidence of the Mahometans, cause most tremendous conflagrations. It is even believed, with or without reason, that the Turkish public employ the setting fire to the city as a mode of communicating their opinion on the conduct of their rulers. The scene is terrible, from the extent of the blaze, the deep rolling of the drum from the top of the minarets, and the crowds that assemble, among whom even the grand signior himself is expected to be present. It is reckoned that Constantinople rises entire from its ashes in the course of every fifteen years; but no advantage is ever taken of the circumstance to improve its aspect. The fallen streets are immediately reconstructed with all their imperfections, and the houses rebuilt of the same fragile materials. This city contains, however, some structures that are very magnificent. Among them stands foremost the mosque of St. Sophia, accounted the finest in the world, first built as a church by Justinian, and converted by the conquering Turks to its present use. The mosques of Sultan Achmet and of Suleyman (*fig. 518.*) are equally vast and splendid, but not marked by the same classic

taste. The numerous minarets are in general airy and elegant, and add greatly to the beauty of the city.

518

MOSQUES OF SULTANS ACHMET AND SULEYMAN.

the interior of Asia. A great forest near it contains the most splendid cemetery of the empire, as all the grandees of Constantinople seek to deposit their remains in Asia, which

519

CASTLE OF THE SEVEN TOWERS.

they consider as a Holy Land, in the possession of true believers, while Europe is almost entirely the prey of the "infidel." In this vicinity is situated the castle of the Seven Towers (*fig. 519.*) used by government as a state prison.

3572. *Romania, or Roumelia*, is sometimes used in a very extensive sense, as comprehending all European Turkey except the provinces on the Danube; but more strictly it is applied to the plain on the site of ancient Thrace, comprehended between the chains of Hæmus, Rhodope, and the sea. In this fruitful but ill-cultivated plain, Adrianople, the city of Adrian, rears its lofty walls and towers. It was the European capital of the Turkish empire before the fall of Constantinople, and it is still a large city, five miles in circumference, and containing about 100,000 inhabitants. There are several ancient palaces, and a splendid mosque erected by Sultan Selim out of the ruins of Famagosta in Cyprus; but the streets, according to Dr. Walsh, are narrow and crooked, the houses ill built of brick and mud. The ancient strength of its fortifications has gone into decay; so that General Diebitsch, in the campaign of 1829, entered it without resistance. Kirkliissa is a large old dirty town, of 4000 houses, whose Turkish inhabitants are imbued with all the pride and prejudice of their nation; but there are a considerable number of Jewish and Greek families, who practise some industry, and send large quantities of butter and cheese to the markets of Constantinople. Bourgas, on a bay of the Black Sea, near the foot of the Balkan, has a manufactory of pottery, and carries on a considerable trade. Gallipoli, on the Strait of the Dardanelles, is also a large and commercial place, with 17,000 inhabitants.

3573. *Bulgaria* forms a long plain, between Hæmus on the south and the Danube on the north. Some portions are rugged, others marshy; but upon the whole it possesses a large share of beauty and fertility. The Bulgarians, a race originally Tartar, now profess the Greek religion; and are quiet, industrious, and hospitable. Sophia, the capital, at the foot of the mountains, is a large town, with 50,000 inhabitants, and carries on a great inland trade between Salonica and the interior countries of eastern Europe. It is also the usual rendezvous of the Turkish armies taking the field against the Russians or Austrians. Schumla, near the entrance of another of the great passes of the Balkan, forms rather a chain of rudely entrenched positions than a regular fortress; yet such is the obstinacy with which the Turks defend such situations, that this city has repeatedly baffled the utmost efforts of the Russian army, which in 1828 was obliged to retreat with signal disaster. Even in Diebitsch's victorious campaign of 1829, he was unable to reduce the place, but passed it, and, crossing the Balkan to Adrianople, intimidated the Porte into a peace. Schumla is a large city, with numerous mosques and minarets glittering with burnished tin plates. It is distinguished by numerous workmen in tin and brass. Ternovo, the ancient capital of the Bulgarian kings, commands another of the Balkan passes. Varna, a port on the Black Sea, is also a leading military station, and was the theatre of a signal victory gained by Amurath the Great over the Hungarian troops.

3574. *A chain of fortresses on the Danube*, large, and strongly fortified, formed long the main bulwarks of the Turkish empire. The chief are, Widin, the residence of a pacha; Giurgevo, Nicopoli, Rutshuk, Silistria. They are all of nearly similar character, extensive and populous, uniting with their importance as military stations that derived from an extensive trade along the Danube. Rutshuk is the largest, containing 7000 houses, inhabited by Greeks, Jews, and Armenians, who carry on an active trade. The country round is a dead flat as far as the eye can reach. Giurgevo is considered by Mr. Walsh the most complete fortress in the empire. It is situated amid dismal swamps; but in the vicinity are mines of rock salt, purer than that of Cheshire, and white as snow. Silistria, in the last war, distinguished itself by a long and obstinate defence.

3575. *The principalities of Moldavia and Wallachia*, on the south of the Danube, form an extensive region, about 360 miles in length and 150 in breadth, presenting a very nearly similar aspect and character. They compose a vast plain, reaching from the river to the southern and eastern boundaries of the Carpathian mountains. The districts adjoining to these eminences are varied and picturesque, but towards the Danube become flat and marshy. The plains, particularly in Moldavia, are covered with almost innumerable stagnant pools, which communicate to the air pestilential qualities. The climate is subject to singular variations: in summer extremely hot; while in winter, under the latitude of the south of France, the Danube is for six weeks of the year so completely frozen as to bear the heaviest carriages. The soil, where not actually inundated, is exceedingly productive. Wheat is raised of excellent quality; but the Turks have imposed restrictions on the disposal of it, and the occupation of pasturage is preferred. The peasantry (*fig. 520.*) are a laborious, oppressed

WALLACHIAN PEASANTRY.

race, of simple habits, and living in rude abodes. They are of low stature, weak, with light silky hair, and mostly dressed in sheepskins. The Wallachians form a considerable part of the population of Transylvania and of all the neighbouring countries. These two countries were once governed by native princes, and have not finally renounced all pretensions to liberty; yet the mixture of rude independence with debasing despotism does not cause the yoke to press at all lighter on the body of the people. The boyars exercise over them the same rude ty-

ranny as the European nobles during the feudal ages; while the prince of Moldavia and the hospodar of Wallachia, though they must belong to the Greek nation, do not, on that account, exercise any milder yoke over their countrymen. Appointed by the Porte from favour or purchase, they employ their arbitrary sway solely to practise the most enormous exactions, and amass immense wealth during their short and precarious rule. The body of the people are of the Greek nation and faith; and in these countries the Greeks first raised the standard of independence: they experienced for some time a gleam of success; but their efforts were speedily and completely crushed. The cities in this region are large and rude. Jassy, the capital of Moldavia, is situated in the interior of the country, amid a marshy district, which renders it unhealthy. Galacz, at the junction of the Danube and the Sigeth, carries on most of the trade, and might attain considerable importance if the navigation of the former river were made free. Bucharest, the capital of Wallachia, is a much larger city, containing about 80,000 souls. It is built upon a dismal swamp, to render the streets passable over which, they are covered with boards; but, in the intervals, water springs up from dirty kennels beneath. Here, according to Mr. Walsh, European and Oriental costumes and manners unite in nearly equal proportions. The people are clothed half in hats and shoes, half in *calpacs* and pelisses; the carriages are driven as often by buffaloes as by horses. The nobles live in extravagance and dissipation, while the people are plunged in poverty.

3576. *Servia and Bosnia* are two countries, of smaller extent, reaching westward from Bulgaria, and, like it, situated between the mountains and the Danube. They do not, however, present any similarly vast plain, but are penetrated by lofty ranges, through which flow numerous rivers, of which the most important are, in Servia, the Morava, in Bosnia the Drino and Bosna. The territories consist thus in a great measure of a succession of fertile valleys, in which wheat, maize, and other valuable grains are reared; and though the people are reproached with want of agricultural industry, Bosnia at least produces grain somewhat more than enough for its own supply. Cattle, however, is the chief product in both; and

they possess some valuable breeds. The hills are covered with extensive forests, and abound in fruit trees, and in valuable aromatic herbs and plants. Neither the Servians nor Bosnians are under entire subjection to the Porte. The former are chiefly of the Greek church, and under Czerni Georges made a most gallant resistance to the Turkish power, and extorted extensive privileges. The Servians, though without much literature, have a native poetry, which has attracted admiration. The Bosnians, also, though Mahometans, possess many feudal rights, having thirty-six hereditary captains, and even deputies from the towns. Their language is a dialect of the Servian. Polygamy is seldom practised, and their females appear in public unveiled.

3577. *Several large cities* are found in these provinces. The capital of Servia is Belgrade, a fortress of extraordinary strength, long considered the key of Hungary, and disputed with the utmost obstinacy between the Austrians and Turks. It is now equally distinguished as a seat of inland commerce, being the great entrepôt between Turkey and Germany, and is supposed to contain about 30,000 inhabitants. Bosna Serai, capital of Bosnia, is still larger, having been estimated to contain 60,000 inhabitants. It trafficks in arms and jewellery, and receives numerous caravans from Constantinople. Such is the spirit of independence here, that the Turkish governor is allowed to reside in the city only three days of the year. His fixed residence is at Traunick. Jaicza, the ancient capital of Bosnia, is now in decay.

3578. *The interior of Dalmatia*, called commonly *Herzgovinia*, belongs to the Turks, though the Austrians have succeeded Venice in the possession of the maritime districts. This territory is very rugged, and difficult of access; yet some parts are productive in wine and olives. Mostar, the capital, with 12,000 inhabitants, is celebrated for the manufacture of swords. Montenegro, a district to the south, is covered by a still bolder range of mountains, within which the inhabitants, a peculiar race, have maintained their independence against their most powerful neighbours. The Montenegrins, about 60,000 in number, are governed by a national council; and, as is usual with the inhabitants of mountainous districts, they are brave, hospitable, vindictive, and superstitious.

3579. *Albania* is a more remarkable and important country. It extends about 200 miles along the Gulf of Venice and the Mediterranean, and has an interior breadth varying from 30 to 100 miles. It is entirely rugged and mountainous, diversified by numerous streams and lakes, and of an aspect extremely picturesque. The inhabitants, a race of bold mountaineers, have distinguished themselves by their valour from the earliest ages. This was the domain of Pyrrhus, whose victories in Italy made him so formidable to Rome. In the decline of the Greek empire, Albania rose, under its present name, to the character of an independent kingdom. When attacked by the Turks, it made a most gallant resistance; and the exploits of Scanderbeg, its hero, might adorn the pages of romance. Even at the beginning of the present century, Ali Pacha, a native of the country, erected a power almost completely independent of the Porte, extending over several of the surrounding countries. At length he was overpowered, betrayed, his head cut off, and suspended from the gate of the seraglio at Constantinople. The Turks thus re-established their dominion, and renewed the division into the four pachalics; those of Scutari, Ochrida, Vallona, and Butrinto.

3580. *The inhabitants of Albania* are estimated at 1,200,000; and though these include a considerable number of Turks and Greeks, the basis consists of a peculiar native race, differing completely from all others in the empire. Their conversion to the Mahometan creed has been very imperfect: the males of a family go usually to the mosque, while the females attend church, and no discord arises out of this difference; so that the Turks regard them as little better than infidels. The Albanian is of middle stature, with an oval visage, and high cheekbones; bearing an erect and majestic air. He piques himself on a frank and open demeanour, holding in contempt the art and dissimulation of the Greek. He has nothing, too, of the inert solemnity of the Turk; is gay and active, yet a stranger to the habits of regular industry. He walks constantly armed; his delight is in combat, and even in rapine. The mountainous tracts are infested with numerous bands of robbers, which most of the Albanians join, for at least some part of their lives, without the least shame: it is common for one to speak of the time when he was a robber. They seek military employment also in the service of the sultan, and of the different pachas, particularly that of Egypt. Although they form only a tumultuary assemblage of men, with scarcely any subordination or regular distribution into corps, yet they are so individually active and intrepid, that they have rendered themselves formidable even to highly disciplined troops: they compose the only infantry in the Turkish armies that is at all effective.

3581. *Joannina*, which Ali made the capital, has a very picturesque situation on a lake, surrounded by lofty mountains, and is supposed to contain a population of 35,000. The houses are irregularly built, intermingled with gardens and trees. A great proportion of the inhabitants are Greek. Arta, on a gulf of the same name, is the chief theatre of trade. Scutari, or Scodra, the capital of Upper Albania, is situated in a rich plain; has a population of about 16,000; and carries on some considerable manufactures of cloth. Its pacha is now the most considerable potentate in Albania.

BOOK II.

ASIA.

CHAP. I.

GENERAL SURVEY OF ASIA.

3582. *Asia is an immense continent*, the largest in the ancient world; and, perhaps, nearly equal to Europe and Africa united. It is surrounded by sea through much the greater part of its outline, which, though broken by large gulfs and peninsulas, presents generally a huge unbroken mass, formed into a kind of irregular square. Its most northerly point is Cape Ceverovostchoi, on the frozen confines of Siberia, in latitude about 77° N.; its most southerly is the terminating point of the Malayan peninsula, in about 2° N. To the east it terminates in East Cape, about longitude 170° W. from London; to the west in Cape Baba, the most westerly point of Asia Minor, in 26° E. long. On a general estimate, and omitting the most prominent points, we may state Asia at 6000 miles in length, and 4000 in breadth; which, supposing a regular figure, would give 24,000,000 square miles; but, in consideration of the many irregularities, a considerable deduction must be made.

SECT. I. *General Outline and Aspect.*

3583. *The boundaries of Asia* are chiefly formed by the great oceans. On the north it has the Arctic or Frozen Ocean, which, for a great portion of the year, presents an unvaried expanse of ice and snow. To the east and south it faces the great Pacific, which separates it from America by almost half the breadth of the globe. On the south, however, this ocean is enclosed by the Oriental Islands, so as to form a gulf of vast dimensions, called the Indian Ocean. The western limit alone touches on the other continents, and constitutes a very varied line of land and sea. From the north, opposite to Nova Zembla, a chain of mountains, called the Urals, breaks the uniformity of the great northern steppes. From the termination of that chain to the river Don the line is somewhat vague; but thence, that river, the Black Sea, the straits connecting it with the Mediterranean, and the Mediterranean itself, form a distinct boundary. Asia is joined to Africa by the isthmus of Suez, and separated from it by the long canal of the Red Sea. The immense expanse of its territory presents every possible variety of site and climate, from the dreary confines of the polar world to the heart of the tropical regions. Every thing in Asia is on a vast scale; its mountains, its table-lands, its plains, its deserts. The grandest feature, and one which makes a complete section of the continent, is a chain of mountains, which, at various heights, and under various names, but with very little, if any, interruption, crosses Asia from the Mediterranean to the Eastern Sea. Taurus, Caucasus, and the Himalayah are the best known portions of this chain. On one side it has southern Asia, the finest and most extensive plain in the world, covered with the richest tropical products, and watered by magnificent rivers proceeding from this great storehouse, and filled with populous nations and great empires. On the other side, this chain serves as a bulwark to the wide table-land of Thibet, which, though under the latitude of the south of Europe, has many of the characteristics of a northern region. To the north, the recent observations of Humboldt exhibit three parallel chains; the Kienlun or Mooz Tagh, the Thianchan or Celestial Mountains, and the Altaian. These also support table-lands; but not, it appears, so very elevated as has hitherto been supposed. They are not believed by that traveller generally to exceed 4000 or 5000 feet high, and in many places enjoy a mild and temperate climate, yielding not only grain, but wine and silk. Elsewhere they are covered with rich pastures, and tenanted by numerous wandering races, at once pastoral and warlike, whose victorious bands have often over-run and subjugated the empires of the south. The Altaian chain separates Middle Asia from Siberia; a long range of the bleakest land on the face of the earth. Some of the southern districts have been found by the Russians capable of supporting numerous herds of cattle; but the rest is abandoned to wild animals, not generally of a ferocious description, but by the beneficence of nature covered with rich and precious furs, which afford a grand object for hunting and trade.

Fig. 522.

MAP OF ASIA—EAST PART.

859

3584. *One grand feature of Middle Asia consists in large lakes or inland seas, salt like the ocean, receiving considerable rivers, and having no outlet. These are, the Caspian, the Aral, the Baikal, and several others of lesser magnitude. They are chiefly situated on the depressed and almost concave surface of Western Tartary, which, according to Humboldt, is 200 or 300 feet beneath the level of the sea; a sinking which he considers connected with the prodigious elevation of the regions to the eastward.*

3585. *No continent has so many rivers of the first magnitude, some of which yield in length of course only to the amazing waters of the New World. We may distinguish in Asia three systems of rivers; one, comprising the most distinguished and important streams, descends from the principal chain of mountains, fertilises the great southern empires, and falls into the Indian Ocean. The most remarkable streams of this class are the Euphrates, the Indus, the Ganges, and the Menam, or river of Siam. Again, from the parallel chain which separates Tartary from Siberia is another series of rivers, which direct their course to the Northern Ocean; the Obi, the Irtish, the Yeniseï, the Lena, — gloomy streams, of vast length; but flowing in this inhospitable region, and bound by almost perpetual frost, they afford little aid either to agriculture or to the intercourse of nations. A third system consists of the rivers which, rising in the high mountain centre of Asia, flow across the empire of China, to whose prosperity they mainly contribute, and fall into the Eastern Pacific. The Amour runs in the same direction through Northern Tartary, but without any profit to that barren district. Lastly, the Jaxartes, the Oxus, and others of great magnitude, though secondary to the above, flow along the great plains of Western Tartary; but, unable to reach the ocean, expand into the Aral, the Caspian, and other inland seas.*

3586. *Asia, besides its vastness as a continent, is distinguished by its archipelagoes of islands, of an extent sufficient to constitute kingdoms. Such are those of Java, Sumatra, Borneo, and the Philippines, which, with many smaller ones, comprise the Oriental Archipelago, distinguished by its brilliant metallic products and rich spices; and exhibiting a singular mixture of barbarism and civilisation. The two contiguous islands of Japan comprise a state dignified with the title of empire. Ceylon, bordering on the extremity of Hindostan, almost rivals the beauty and fertility of that celebrated region. We do not here include under Asia those huge insular masses, New Holland, New Zealand, &c., which have of late received the name of an Australian continent; nor the endless groups scattered over the Pacific, and which have also, with somewhat questionable precision, been made a separate quarter, under the title of Polynesia.*

SECT. II. Natural Geography.

SUBSECT. 1. Geology.

3587. *The Geology of Western Asia, consisting of Asiatic Turkey, Arabia, and Persia, having never been examined in a systematic manner, or by scientific observers, does not admit of any delineation that could be creditable to this work, or satisfactory to the public.*

entirely divested of their foliage. The same holds good with about 300 of those in the Mediterranean flora, or a quarter of the whole of its ligneous vegetation. The Temperate Zone, again, has but forty species with persistent leaves, the Arctic Transition Zone about twenty-four, and the southern limit of the Arctic Zone ten at the utmost.

3595. *In the Mediterranean district* of the Temperate Transition Zone, the Compositæ and the Leguminosæ are the most numerous families: indeed, they alone constitute one fourth of the whole vegetation. Then come the Cruciferae, Gramineæ, Labiatae, Caryophylleæ, and Umbelliferae; afterwards the Scrophularinæ, Rosaceæ, Boragineæ, Ranunculaceæ, and Cyperaceæ; finally, the Liliaceæ. It may be remarked, that the Compositæ, Cruciferae, Labiatae, Caryophylleæ, Umbelliferae, Rosaceæ, Ranunculaceæ, and Cisteæ, with some other families, present, in the Temperate Transition Zone, a greater number of specific types than any where else. The chief part of the species of these families that are found in equatorial regions inhabit there the valleys and the mountains; thus proving that the violent and continued heats of the plains are uncongenial to their nature.

3596. *Those families of plants* which hold the most important rank among the productions of the Temperate Transition Zone, whether because they contribute the loftiest of those trees which clothe the mountain's side, or because they furnish those individuals of middling stature which delight to grow on the hills, with the branching shrubs which form the hedges, and the low woody plants whose rough and stunted growth overspreads the uncultured plains, are, in the first place, the Amentaceæ and the Coniferae (which alone compose more than half of the arborescent vegetation), and next the Rosaceæ, Leguminosæ, Terebinthaceæ, Rhamneæ, Jasmineæ, Caprifoliaceæ, Cisteæ, Ericineæ, and Labiatae.

3597. *But what gives the Transition Zone its peculiar character* is the combination of those species which may be considered as belonging to three different regions; that is, the vegetation of the equatorial districts, that of the northern, and the growth which is peculiar to the countries situated between the 30th or 32d, and the 44th and 45th parallels. The first is seen in its decline, the second in its commencement, and the third in its full perfection. The latter occupies the greater portion of the soil; the two others form, here and there, colonies more or less flourishing in proportion to their vicinity to the parent land. The Date tree, the Latanier (*Latania?*) and even the Doum* (*fig. 523.*) (if it be true that it grows in Galilee), the Sugar-cane, the Sorgho† (*fig. 524.*), the Agave, the

THE DOUM.

Cactus Opuntia or prickly pear, the Orange and Lemon trees, the Asclepias gigantea and other arborescent Apocineæ, several African and Asiatic Mimosas and Acacias, confined to the favourably situated plains: these represent the vegetation of the equatorial plains. That of the southern countries may be observed on the mountains, and consists in the common Oak, the Ash, the Alder, the Hornbeam (*Carpinus orientalis* Lamarck), the Beech, the Birch, the Yew, the common Fir, the yew-leaved Fir, the Scotch Fir, &c. As to the vegeta-

THE SORGHO.

* The Cucifera thebaica. This tree is much prized in the countries where it abounds. "A native of the desert," says M. Delile, "its shelter renders many places, that would otherwise be totally waste, capable of cultivation. Many species of thorny sensitive plants, which rarely grow in the spots watered by the Nile, find an asylum under its shadow; they increase there; and, spreading in the direction of the desert, limit its extent by augmenting the productive districts. The trunk of the Doum is composed of longitudinal parallel fibres, similar to that of the Date, but much stronger and closer. It is cut into planks, which are used for doors in Upper Egypt: the fibres are black, and the intermediate pith is yellow. The leaves are used for making carpets, bags, and baskets of various kinds: the pulp of the fruit is pleasant to the taste, and would be much used for food, if it were not for the numerous fibres with which it is mixed; still the inhabitants of Saïd, or Upper Egypt, do frequently eat it. The fruit is sold in large quantities, and very cheap, at Cairo, where it is rather considered as a useful medicine than an article of food: it tastes like gingerbread, and is much relished by the children. An infusion, something like the drink made of steeped liquorice root, or the pods of the Carob tree, is prepared from the fruit, which, before maturity, contains a clear and tasteless fluid. When ripe the kernel becomes very hard, and fine beads for rosaries are made of it, as it takes a beautiful polish.

† This plant, the Holcus Sorghum of Linnæus, is one of the most valuable of all the Cerealia. It is extensively cultivated in Egypt, where three harvests are gathered of it every year. According to Vahl, it is identical with the Holcus Durra of Forskål, which is commonly called Durra by the Arabs and Egyptians.

tion of the transition zone, it bears some features of similarity to the two others, without, however, being confounded with them. The Fig, the Mulberry, the Liquidambar, the Walnut, the Pistachio, the Lentisk, the Terebinth, the Rhus, the Olive, the Myrtle, the Pomegranate, the Syringa, the Storax, the Sweet Bay, the Tamarisk, the Diospyros, the Mimosa Julibrissin, the Carob tree, the Judas tree, the Oleander, the Evergreen Oaks, &c. ; these create no disparity among the equatorial vegetation. The deciduous-leaved Oaks ; the Junipers, which attain a height equal to that of some trees ; the Aleppo Pine, the Stone Pine, the Corsican Pine, the Oriental Spruce (*Abies orientalis*), the Apricot, Peach, and Quince Trees, with other arborescent Rosaceæ which we cultivate in our orchards, and which form forests in Cabulistan and Asia Minor, bear a considerable analogy with the wild vegetation of our own countries.

SUBJECT. 3. Zoology.

3598. *The Zoology of this great division of the earth* is as vast as the climate of the regions it comprehends is diversified. Inhabited by nations jealous and superstitious, or lawless and barbaric, obstacles of no ordinary difficulty have long debarred the European from a full investigation of those productions of nature characteristic of the Asiatic continent. That intellectual development which leads the Caucasian to discern his God and adore his Creator in the contemplation of his works, does not appear in the Mongolian, a race long sunk in gross idolatry and in a senseless superstition on the divinity of perishable beasts. Hence it is, that the interior of China and Thibet, those vast regions forming the centre of Asia, have never been trodden by the naturalist or the man of science. The few and very imperfect ideas, therefore, that can be formed of their zoology, have been merely gathered from partial gleanings made on the confines of European India, and of the neighbouring provinces. From such scanty materials we can frame no remarks, approaching to that precision with which we have noticed the zoology of Europe ; although they are still sufficient to furnish a few interesting observations of a general nature.

3599. *The principal divisions of Asiatic zoology*, indicated both by the geographic features of the continent, and by the nature of their respective animals, are properly three. The *first* commences from the polar regions, and includes the whole of Asiatic Russia. The natural boundaries of this region, on the west, are the Ural mountains, while its southern extremity is marked, with equal precision, by the lofty Altaïan chain ; the cradle, as it has been termed, of the Mongolian race. The *second* great division, as we have already intimated, comprehends the little-known empires of China, Japan, Thibet, the Tartaric provinces bordering on Persia, and the eastern shores of the Caspian Sea. The stupendous mountains constituting the Himalayan chain appear to form a natural boundary to this intermediate region. Under the *third* division we comprise the greater portion of Hindostan and Malacca, together with Java, Sumatra, and such islands as, by their situations, lie contiguous to the continent, and by their productions exhibit the characteristics of Indian zoology, blended in some degree with that of Australia. In this arrangement we have omitted the whole of Asia Minor, and the nations about the Caucasian mountains ; because, so far as the productions of these regions are known, they assimilate closely to those of Europe ; yet Persia appears to possess many animals of Asia, and this country may possibly present a union of the two faunas.

3600. *Of the first, or northern Asiatic division*, our zoological information has been almost entirely furnished by the researches of Pallas, one of the greatest naturalists of the age. The shores of the Icy Sea do not, however, appear to exhibit any existing animals essentially different, in genera or species, from those common to Arctic Europe. Neither are the frozen regions and arid *steppes* of Siberia congenial to the abundance or increase of more than a few species. Such, nevertheless, as appear adapted, by their structure or economy,

to inhabit these wastes, are curious and interesting ; and present to the naturalist many forms, either rare in European Russia, or unknown to the westward of the Ural mountains. As we approach the Caspian Sea and the confines of Persia, a mixed fauna becomes evident : for, while many of the species are unknown to Europe, they belong, for the most part, to the same natural groups, rather than to such as are more peculiarly Asiatic : on the other hand, the Caspian Tern (*fig. 525.*), and numerous other birds, identically the same with our own, are found in abundance on the shores of the Caspian Sea. Hence it appears not improbable that the western zoology of Asia and of the

European regions meet together, and lose their distinguishing features, in the countries bordering upon these territories.

3601. *In regard to Central Asia, forming the second zoological division*, we have already intimated how scanty has been the information supplied for its elucidation. It is, indeed,

so meagre, that we may possibly be censured for intimating a marked difference, without being prepared fully to explain its nature. Yet, if we consider the great elevation of the central table-land, its sandy and barren soil, when compared with the rich vegetation of southern India; and its warm temperature, as opposed to that of Siberia, every principle of analogy leads to the supposition that its productions must be peculiar; and that these extensive regions must be inhabited by animals with habits and structures adapted for such situations. Nor is this belief unsupported by facts. Central Asia is remarkable for a peculiar and a very distinct species of horse, called the Dziggtai, or *Equus Hemionus* of Pallas; a most extraordinary animal, which we shall subsequently notice. The same

ARGALI.

countries are also named as the metropolis of a peculiar species of Argali, or sheep (*Ovis Ammon*) (fig. 526.), although its range appears extended both to Siberia and the Caucasus. It is also probable that the Arnee buffalo, and another gigantic animal of this genus mentioned by Major Smith as found only on the sides of the Himalayan mountains, may more correctly belong to the zoology of Central Asia. The mountains of Thibet and Boutan offer the principal asylum to another indigenous quadruped of large size, called the Tartaric or yak ox (*Bos Poëphagus*). If so many quadrupeds, of the first magnitude in their respective families, are inhabitants of these central regions, how many others, less calculated to excite the notice of travellers, must still remain in obscurity!

such as have not yet been seen by Europeans. These drawings are numerous in this country, and frequently represent large and beautiful pheasants, totally distinct from such as occur in southern India. We have before observed, that Asia is chiefly remarkable for the variety and brilliancy of its gallinaceous birds; and that most of these, like the *Lophophorus refulgens* Tem. (fig. 527.), and other allied species, are only found in the mountainous and elevated provinces of the interior. Upon the whole, therefore, it seems highly probable that these inland regions may be the chief metropolis of many peculiar birds, unknown to the northern and southern extremities of the continent.

LOPHOPHORUS REFULGENS.

3603. The third division, comprising southern India, presents a zoology of great richness and peculiarity. The excessive heat of the climate, the lower and consequently more humid nature of the plains, are equally favourable to an exuberant luxuriance of vegetation, and to the increase of animal life. It is here, consequently, that we meet with numerous animals of a large size, and others of rapacious ferocity. Troops of the Asiatic elephant, with wild boars, buffaloes, and antelopes, among the herbaceous tribes, abound; while the woods and jungles give shelter to more ferocious animals, which, in spite of increasing population, still retain their ancient possessions. Among these the great tiger of Bengal stands foremost; while panthers, leopards, lynxes, hyænas, and jackals appear to swarm

in the less cultivated districts. The one-horned rhinoceros is still a common inhabitant of the swampy banks of the great rivers. But this portion of Asia is chiefly characterised as

LONG-ARMED APE.

being the native region of those large apes, which the credulity of early travellers metamorphosed into wild men, and which some modern naturalists would persuade us form part of the same order as that to which we ourselves belong. Various species of these disgusting caricatures of the human shape are scattered in the southern extremities of the two great peninsulas of Hindostan and Malacca; but their chief metropolis is in Java, Sumatra, Borneo, and such islands as lie on the southern confines of the Asiatic division, and towards the northern limits of Australia. The Gibbons, or long-armed apes (fig. 528.), are of a milder nature. The African apes, equally large with the orang utan, but marked by distinguishing characteristics, occur nearly in the same parallels of latitude. These species will be subsequently noticed in the details of those countries to which they more particularly belong.

3604. The birds of southern Asia, but more particularly those of the Indian islands, have already claimed our attention: it will therefore be sufficient merely to notice such groups as

appear most striking on the continent of India. The ring-necked Parrakeets (*fig. 529.*)

RING-NECKED PARRAKEET

are peculiar to these latitudes, and present a lovely group of birds, uniting a form of exquisite grace with the most delicate and chaste tone of colouring; nearly all the species are marked by a jet black collar round the neck. Towards the mountains of Nepal General Hardwicke discovered a bird of this family fully equal in size to a South American Macaw, and apparently belonging to the same group. Many of the short-tailed Parrots are eminently beautiful; and one, the Vernal Parrot (Swains. *Zool. Illus.*, 2d series, No. 1.) is not larger than a sparrow. Various species of Hornbills congregate in large flocks, and are scattered throughout this part of India; the grotesque form of their large bills, generally furnished with a singular-shaped casque or horn, is very remarkable. The nectar of innumerable odoriferous plants affords nourishment to a variety of splendid little birds, of the richest and most dazzling plumage: these compose the genus *Cinnyris*, and represent, in the Old World, the humming-birds of the New. The Drongo Shrikes are more numerous in India than in Africa: living solely upon insects, which they catch upon the wing, somewhat in the manner of swallows: they contribute to check the increase of insects, probably as effectually as do the Tyrant Shrikes, peculiarly appropriated to the New World. The smaller birds of India, particularly among the insectivorous families, are very im-

perfectly known; several belong to groups scattered both in Europe and Africa; yet future research will no doubt bring to light many others, peculiarly Asiatic. The genus *Gryllivora* among the *Saxicolæ* or Stonechat Warblers, in its typical examples, may probably be of this description. The Scansorial Birds, both of the continent and islands, are numerous and

BLACK COCKATOO.

beautiful. Among these, the Woodpeckers offer nothing to distinguish them, geographically or generally, from those of other regions. But the true Barbuts, connecting in some degree these latter with the Parrots, are exclusively Asiatic, and abound in such districts as border upon the equator. This singular race of birds, which climb trees with all the agility of the Woodpeckers, are represented in Africa by the genus *Pogonias*, or the Tooth-billed Barbuts; while in the American islands, beneath the equator, we find a third group, distinct in their structure from either. In proportion as we trace the Ornithology of Asia southward, we find it teem with increased interest. It is from the luxuriant islands of the Indian Archipelago that the large Cockatoos of a snowy whiteness have been brought to Europe; while another, perfectly black, *Microglossus aterrimus* Vieil. (*fig. 530.*), inhabits the same region. Yet far more beautiful than these are the graceful and brilliant-coloured Lories, of which numerous species have been detected in the southern extremity of Malacca, and on the neighbouring islands, particularly those of Molucca.

3605. The Rapacious Birds appear to be much fewer in Southern Asia than in any region of equal extent, either of Africa or America. This inequality may possibly arise from the insufficiency of our knowledge, and the inattention of travellers to the subject; yet there are strong grounds for believing that the comparative paucity of this destructive order is one of the peculiarities of Asiatic zoology. Out of twenty-five sub-genera, under which some modern ornithologists arrange the numerous tribe of Falcons, there appears but

LITTLE FALCON.

one (*Hierax*), and that containing but a single species, (*Hierax caerulescens*) (*fig. 531.*), or Little Falcon, which is characteristic of Asia: it is so diminutive as scarcely to exceed the size of a sparrow. The whole of the remaining Falcons, hitherto discovered in these regions, belong to such groups as are common to Europe and Africa. On the other hand, when we consider the number and ferocity of the carnivorous quadrupeds, we may be led to conclude that Nature has assigned to them, as being more efficient agents, the office of keeping down the redundancy of smaller animals, which in other countries is nearly the exclusive province

of the birds of prey. A glance at the zoology of the New World strongly favours this supposition. The largest and most formidable rapacious birds in existence are all exclusive natives of the New World. Out of the twenty-five sub-genera already alluded to, more than one half are peculiar to the continent of America: and although the same numerical supe-

riority is not apparent in the species of the vulture tribe, the deficiency appears made up by numerical quantity. We never met with more than two species of vulture during our travels in Brazil; yet these were in such numbers that a dead animal could not remain

an hour without being discerned and surrounded by these scavengers of nature. The carnivorous quadrupeds of the New World, although not in species, yet in numerical amount, are remarkably few: while the absence of Antelopes, Buffaloes, Wild Hogs, and other large game, so necessary in Asia for the support of its ferocious animals, is a further argument to strengthen this belief; namely, that the distribution of rapacious animals, in the two hemispheres, is balanced by contraries.

3606. *The Rapacious Wading Birds of India* must not, however, be omitted. We apply this term to the numerous family of Herons; which certainly represent, among wading birds, the Vultures and Falcons properly so called. The Gigantic Crane (fig. 532.), *Ardea Argala* Lath. (under which name, more than two species have evidently been confounded), in its uncommon voracity, and in the nature of its food, is completely a bird of prey. It is sufficiently high to appear, when walking, like a naked Indian. As a proof of its amazing voracity, it has been mentioned, that in the craw of one was found a land tortoise ten

GIGANTIC CRANE.

inches long, and a large male black cat, entire, in the stomach! (Lath. *Hist.*, ix. 39.) The rainy season, in India, is always preceded by the arrival of these and other cranes and herons, in great numbers; and the destruction they must create, not only among fish, but land reptiles of every description, is so well known to and appreciated by the natives, that they hold these birds in great estimation.

3607. *Of the Reptiles of India* little need be said. In the rivers are found large crocodiles, of different species to those of Africa. The serpents are numerous, and many are of the most deadly nature: the *Coluber Lebelinus* Lin. is said to destroy the person bitten, by causing an unconquerable and deadly sleep; it is of a small size, hardly more than an inch and a half long. The serpents of British India have been ably illustrated by Dr. Russell. The islands are inhabited by others of a tremendous size; as the great Python, long considered the same with the *Boa constrictor* of the New World. The Chameleons are natives of India no less than of Africa, and are now known to comprise several species. One of the most remarkable reptiles yet discovered is probably

FLYING DRAGON.

the *Draco volans* L., or Flying Dragon (fig. 533.); from which, perhaps, the fabulous writers of antiquity derived their notion of the formidable monster figured in old books. This, however, is a small and inoffensive little animal: distinguished from the lizard tribe by having on each side the body of a broad membrane, like a wing, strengthened by bony processes: it wanders about trees in search of insects, and is thus enabled to spring from bough to bough, and support itself a few minutes in the air. (Shaw, *Nat. Mis.*) Another lizard, of a large size, and, from its delicate flavour, much esteemed as food, is found in Amboyna (*Lacerta amboynensis* L.). The celebrated

hooded snake, or Cobra de Capello (*Naja tripudians* Merr.), is peculiar to India, and with other species is well known to be tamed by the Indian jugglers. Such appear to be the most remarkable reptiles of the Asiatic region: many others might be enumerated; but so little has been done towards the elucidation of their geographic range, that nothing can be stated sufficient to interest the general reader.

3608. *The Native Ichthyology of Asia*, from the number, the variety, and the singularity of its groups, is perhaps richer than that of any other part of the world. Our limits will not, however, permit a long enumeration of names. Many of the Ray fish grow to an enormous size, and are so formidable to the pearl divers, as frequently to attack and injure them when under water. Nothing can surpass the elegant markings, or the beautiful colours, which adorn the tribe of Chaetodons, and the numerous Labri, of these seas. The Ganges and the other great rivers are inhabited by many peculiar Siluri, or Cat-fish; and it is from China that we derive the beautiful gold and silver fish now so completely naturalised in Europe.

3609. *Among the Insects* are many which in magnitude and splendour vie with those of

the New World, particularly the true Papilionidæ, or butterflies, among lepidopterous insects, and the family of Buprestis, in the coleopterous order. Yet, upon the whole, judging from such collections as have been brought to Europe, we have no hesitation in claiming for tropical America a decided superiority in the number, variety, and magnificence of her insect productions. The Scarabæus Atlas (*fig. 534.*), or Atlas beetle, of

ATLAS BEETLE.

Fabricius, near five inches long, from its size and singularity of shape is among the most remarkable of the Asiatic beetles. The splendid green and gold *Buprestis vittata*, with many others of equal size and beauty, are so much admired by the Chinese, that they are kept in cages, when alive, in their rooms; and, when dead, are used as ornaments for dress. Among the numerous butterflies, the names alone of *Papilio Priamus*, *Ulysses*, *Polymnestor*, *Panthous*, and *Octavius* will remind the entomologists of Europe of insects they have long sighed to possess, as fit companions to

the equally superb, though now more attainable, butterflies of Brazil. It is remarkable that Asia appears originally to have furnished us with the greatest proportion of those animals so eminently useful to man, either in a state of domestication, or as contributing, in other respects, to his comfort or luxury. The domestic fowl and the peacock, among birds, are natural inhabitants of this portion of the world: while all the varieties of the silkworm must be added to the list of the former: one species alone has been introduced into Europe, but the natives cultivate several others, from which are made garments less fine in texture, but much more durable, than those fabricated from the common silkworm. It appears, according to the observations of Dr. Horsfield, that in Java, and probably in most parts of India, the Ants are the universal destroyers and removers of all useless or decayed matter, whether vegetable or animal. This is precisely the case both in tropical Africa and America, and at once accounts for the scarcity of those families of Beetles which are appointed to perform such offices in more temperate regions.

3610. *Of the radiated and other marine animals* we have no other accounts than mere names of species. The Cuttlefish of the Indian seas are said to be sometimes so large as to attack the pearl divers, and strangle them in the serpent folds of their arm-like feet. We by no means think this account is devoid of truth; for, even in the temperate regions of Europe, we have been frequently assured, by the Sicilian fishermen, that these animals instinctively cling to living bodies that come in their way, and that many instances have occurred, among the coral divers, where life has been thus endangered. We have ourselves seen an undescribed species, not uncommon on the coast of Messina, whose arms were much thicker than the wrist of an ordinary man: this species is equally dreaded by the Sicilian mariners, although, on account of its delicate taste, it is sought after, and much prized, as an article of food.

3611. *The Conchology of the Indian seas* is the most splendid, profuse, and varied of any division of the world; and forms a remarkable contrast to that of America. When we compare the marine shells of the West Indian seas with those inhabiting the same degrees of latitude in the Oriental Archipelago, the proportion of species in the former is probably not greater than one to six. This fact, which has never, we believe, been observed, furnishes a most interesting subject of enquiry to travellers who, like the illustrious Humboldt, contemplate those mighty causes which influence the grand operations of nature. On looking to the habits of these testaceous mollusca, we find that nearly three fourths are carnivorous; that is, of shell-fish which, like the rapacious quadrupeds on the continent, derive their sole nourishment from attacking and devouring other animals. The conchologist will immediately perceive we advert to the genera *Conus*, *Oliva*, *Voluta*, *Mitra*, *Cypræa*, *Harpa*, *Turbinella*, *Dolium*, *Cassis*, and several others; of which very few species have been found beyond the geographic limits of the great Indian Ocean. Of the numerous and highly prized Cones, a genus containing near 200 species, not more, perhaps, than 10 may be reckoned strangers to Asia. Lamarck enumerates 62 species of Olives, and of these only two have been discovered in other parts of the world. The extensive family of *Mitræ* Sw. or Mitres, are distributed much in the same proportion; while that of the Volutes, containing near 60 species, exhibits but three as natives of Africa, and one only of America. The Acephala, or Bivalve shells, as in most other countries, appear to be fewer both in number and variety; yet in neither of these two great divisions are we acquainted with more than three or four species identically the same with those found in the European seas. Among such as are peculiar to Asia may be mentioned the Hammer-shaped Oysters (*Malleus* Lam.). These, as Dr. Horsfield informs us, are found in profusion, adhering to the submarine rocks, on certain parts of the Javanese coast. The Pearl Oysters are abundant in similar situations, and, when large, furnish that beautiful substance called mother-of-pearl. But the most remarkable bivalve in point of size, in the whole world, is the *Tridacna gigas* (*fig.*

535.), of which the valves sometimes exceed four feet in length, and, with the animal, is of the enormous weight of 500 lbs. : it adheres to rocks by such a strong byssus or ligament, that it can only be separated by a hatchet : the cartilage of the hinge, when cut and polished, is so beautifully iridescent as nearly to rival the opal.

535

TRIDACNA GIGAS.

3613. The herbaceous land shells, likewise, appear very sparingly distributed in the Eastern world ; yet several belong to natural genera not met with elsewhere. The genus *Scarabus* seems peculiar to New Guinea and some of the adjacent islands ; and that of *Onchidium* (fig. 536.), among the slugs, or shellless Mollusca, is remarkable. The Oriental pearl-fisheries are well known to produce great wealth. Mr. Percival, in his account of Ceylon, has given much interesting information on this subject, which will be again adverted to when treating of that island.

356

ONCHIDIUM.

ness and activity to those of Europe. Their voice is also different, producing a groaning sound, somewhat weak, but shrill.

3615. The genera of quadrupeds belonging to this division of the world will illustrate the preceding remarks ; and will better exhibit how much its zoology, in this department of natural history, differs from that of Europe.

SECT. III. Historical View of Asia.

3617. Viewed in an historical light, Asia, to the south of the great ridge of mountains, has been always a wealthy and populous region, the earliest seat of civilisation, and of those great monarchies which, absorbing into one a number of the small original communities, openly aimed at universal empire. The revolutions of Western Asia were alone known to the Greeks ; and here the lead was successively taken by Assyria, Babylon, Persia. This last empire, extending far beyond the dimensions of the others, included Egypt and part of India, to which Xerxes in vain attempted to add Greece. On the contrary, the Greeks became, under Alexander, the conquerors of all the regions over which the Persian sway had extended. All the activity of this great prince, however, and of the learned men who accompanied him, obtained only very imperfect ideas of the extent of Asia, and of the nations which composed it. India was still deemed the most eastern country of the world. The ocean which terminated Asia to the north was imagined to run along the head of the Caspian,

then regarded as one of its gulfs; and thence in nearly a direct line to the Ganges, which was represented as falling into the Eastern Ocean. This line cut off all Siberia, Eastern Tartary, and China, nearly two thirds of the entire continent. Thus Europe was at this time considered as larger than Asia. Ptolemy, by means of the caravan merchants, who supplied Rome with the luxuries of the East, obtained more correct and enlarged views. He learned the existence of China, and could estimate the extent of Asia eastward; but was unable to penetrate the Altaï, or gain any knowledge of the frozen regions of Siberia. The Roman empire, and the states of modern Europe, were soon involved in darkness by the irruption of the barbarous nations, and lost even the knowledge already acquired. New light was obtained by the learned men who sprung up under the caliphate, and who, by the conquests of their countrymen, and the wide diffusion of their faith, gained more extensive knowledge of the interior of Asia than the ancients ever possessed; and even than what, with regard to some districts, modern Europeans have since attained.

3618. *In modern times*, as soon as Europe breathed from the agitations which accompanied the downfall of the Roman empire, peculiar circumstances called her attention strongly towards the East. Such, especially, was the effect of the crusades, undertaken to recover the Holy Land, and to repress the progress of the infidel arms. These celebrated expeditions gave a deep interest to the accounts of Asia and the East; but there was no science to collect or arrange the intelligence which they afforded. The crusading geography regards little except Palestine, and the theatre of the wars for its recovery; it places Jerusalem in the centre of the world, and presents only vague notions of any remote countries. A more distant alarm was given by the rapid conquests of the Tartars under Zingis; and his posterity, after subduing Tartary, China, and Russia, over-ran Poland, and invaded Germany. To avert a danger so pressing, a series of embassies was sent, under Carpini, Rubruquis, and other monks of the Romish church, with commission from the pope and the Christian princes. These envoys were received at the frontiers, and carried far into the heart of Tartary, through regions hitherto untrodden by any European. In these vast plains they beheld the uncouth pomp and barbarous array of the Great Khan; and, besides the vast extent of hitherto unknown land which came under their view, they learned particulars respecting the most remote extremities of Asia. Again, the revival of commerce and industry in Europe was accompanied with an almost unbounded curiosity to explore the vast and opulent regions of the East. Under its influence, a single Venetian citizen, Marco Polo, stimulated, it would appear, almost solely by individual enterprise, penetrated across the whole of Asia, reaching even to the eastern coast of China. His narrative conveyed an idea of the vastness of the continent, and of the splendour of its distant regions, surpassing the most magnificent conceptions hitherto formed. Several adventurers followed in the same path, but with inferior success; and the celebrated narrative of our countryman, Sir John Mandeville, is, we fear, a mere tissue of imposture. The mixture, or at least the appearance, of fable in these narratives, caused the public to doubt; until the Portuguese, in the reigns of their great kings, John and Emanuel, under the conduct of Vasco de Gama, dispelled the mystery, by passing the southern cape of Africa. They soon arrived in India; and in the course of twenty years, in the pursuit either of commerce or conquest, explored all the shores of Asia from Arabia to Japan. A full view was thus acquired of the extent of the continent in the principal dimensions. Its northern expanse and limits, however, remained still hidden in obscurity. Even Tartar conquest had never penetrated beyond the Altaï, or discovered any objects worthy of its ambition in these frozen regions. This career was reserved for Russia. Notwithstanding its poverty, this region, by its wide extent, and the facility of such a conquest, tempted her ambition. Her first operations were made from the north and the province of Archangel. Anika Strogonoff, an enterprising merchant, penetrated by his own exertions to the northern Obi and the country of the Samoieds; and, by the valuable furs, and the specimens of a new and singular people which he brought thence, roused the curiosity of the court. But Siberia was chiefly made known by the romantic adventures of Yermak the Cossack, who, setting out with a small body of his countrymen, found it easy to drive before him the undisciplined forces of the Tartars, and was soon unexpectedly at the head of a great kingdom. The czars accepted him as a vassal, and after his death steadily went on in the career of discovery and conquest. In 1639, about 50 years after the first entrance into Siberia, Dimitri Kopilof reached the shores of the Eastern Ocean. Thus an empire, nearly 4000 miles in length, was added to Russia by a handful of Cossacks and hunters. The questions, however, whether Asia be every where bounded on the north by the Polar Ocean, how that ocean communicates with the Pacific, and whether the continents of Asia and America be conjoined or separated, have been anxiously enquired and disputed among geographers. The English and Dutch made it one of the first efforts of their infant navigation to seek by this course a route to the East Indies; but when they formed such a hope, they were ignorant of the vast extent and desolate character of these shores, and of the huge masses of ice with which they were almost perpetually obstructed. Accordingly, the boldest navigators who made the attempt, if they did not perish, were arrested at or near Nova Zembla, and thought themselves fortunate in being

able again to reach home, leaving their object unfulfilled. The Russians, however, by land, or in small barks, gradually crept along these shores, and found their territories every where bounded by the Frozen Ocean. At length the united efforts of Behring, Shalaurof, and Cook discovered a strait separating the two continents, and beyond which, on each side, they rapidly diverged. There remained still, however, on the Asiatic coast a portion, not fully explored, which some alleged made a great circuit, and rejoined that of America. According to Captain Cochrane's account, the late expedition of Baron Wrangel has settled this question, and ascertained that there is a continuous ocean along the whole north of Asia.

SECT. IV. *Social and Political State of Asia.*

3619. *In regard to its social and political state*, Asia presents, of course, a most varied scene; and yet there are some features which at once strike us as generally characteristic of this continent. Among these is the transmission of institutions, usages, and manners unaltered from the earliest ages. The life of the patriarchs, as described in the earliest of existing historical records, is still found unchanged in the Arab tent. The courts of Nineveh and Babylon seem to have been marked by features of pomp nearly similar to those of Delhi and Ispahan. Asia, at a very early period, anterior even to the commencement of regular history, appears to have made a vast stride in civilisation; but then she stopped, and has suffered herself to be far outstripped by the originally less advanced nations of Europe.

3620. *The despotism* to which the people of Asia are generally subjected is connected, probably, with this stationary character. A republic, an hereditary aristocracy, a representative assembly, a regular control of any kind, are, except in some local and peculiar circumstances, ideas altogether foreign to the mind of an Asiatic. While, however, the general principles of government remain so fixed and immutable, the change of ruler and of dynasty is much more frequent than in Europe. As the ideas of hereditary right and of primogeniture, are much less deeply rooted, a younger son, or even uncle, of the reigning sovereign if more able and popular, finds it easy to dispute, and even to wrest the sceptre from his feebler hands. Oriental sovereigns, even the greatest, still maintain the primitive institution of sitting and administering justice in person. Though immutable in their forms of court and maxims of government, they are changeable as to their place of residence and seat of empire. Every successive prince usually selects some favourite city, which he either creates or raises from insignificance, and lavishes his wealth in adorning it. The abodes of his ancestors are neglected; and hence Asia is covered all over with decayed capitals and ruined palaces.

3621. *The number of communities, of chiefs, and even of princes, making a regular trade of robbery* is another feature that strongly characterises Asia. They carry it on in no clandestine manner, but avowedly, even boastfully, and as a calling which they consider as honest and respectable. If they have accepted a composition similar to the old English "black mail," or if they have pledged their faith to an individual, they inviolably maintain it. The numerous tracts of mountain and desert afford them holds in which to maintain themselves; and these are seldom far distant from some rich plain, or great commercial route, on which to exercise their depredations. Arabia, from the earliest times, has been a hive of such plunderers.

3622. *The aspect and manners of the Orientals* are different from those of Europeans, and in many respects exhibit a decided contrast. Instead of our tight short clothes, they wear long floating robes, wrapped loosely round the body. A light turban supplies the place of the hat, and sandals are worn instead of shoes. In entering the house, or wishing to show respect, when we would take off the hat, they take off the sandal. They make no use of chairs, tables, plates, knives, forks, or spoons. At meals they seat themselves cross-legged on the floor, and eat out of a large wooden bowl placed in the middle, and filled, not with our solid joints, but usually with stews or sweetmeats. This dish is common to the whole company, and each thrusts in his hand without ceremony, and carries the morsels direct to the mouth. In return, they are very scrupulous about the washing of the hands. They use no beds, or at least nothing that we would call a bed. An Oriental, going to sleep, merely spreads a mat, adjusts his clothes in a certain position, and lays himself down. Their household furniture is thus exceedingly simple, consisting of little more than carpets covering the room, and sofas set round it, both which are of peculiar beauty and fineness. Their attire is also simple, though composed, among the rich, of fine materials, and profusely ornamented with jewels and precious stones. Their arms and the trappings of their horses are also objects on which they make a studied display of magnificence. The beard, over all the East, is allowed to grow, and is regarded with reverence.

3623. *In their disposition and temper*, the people of the East show striking peculiarities. They are grave, serious, and recluse; they have no balls, no theatres, no numerous assemblages; and they regard that lively social intercourse in which Europeans delight,

as silly and frivolous. Unless when roused by strong incitements to action, they remain stretched on their sofas, and view as little better than madmen those whom they see walking about for amusement and recreation. Their moral qualities cannot be very easily estimated, but may be generally ranked below those of Europeans. Their domestic attachments are strong, and their reverence for ancestry deep; their deportment is usually mild and courteous; and they show themselves capable of generous and benevolent actions. On the other hand, among the subjects of the great empires, the obligations of truth and honesty are habitually trampled under foot; the statesmen and chiefs are usually designing, treacherous, and inhuman; devoid of honour, and capable of the most enormous crimes. The smaller tribes, who display a greater manliness and energy of character, are rude, coarse, and addicted to predatory habits. The sentiments and conduct of the Asiatics towards the female sex are such as cannot exist without a general degradation of character. The practice of polygamy, with the jealous confinement to which it naturally leads, seems to be the radical source of this evil. The exclusion of the sex from society; the Mahometan doctrine that they have no souls; the Hindoo maxim which prohibits them from reading, writing, and being present at religious ceremonies; are evidently parts of a general system for reducing them to an inferior rank in the scale of creation. It is true there is one local example (in Thibet) of an opposite system, — female sway, and a plurality of husbands; but this is evidently no more than a capricious exception to the general rule.

3624. *A high and even ostentatious profession of religion* generally distinguishes the Asiatics, and the name of God is continually in their mouths. Their creeds, however, are all marked by that deep tincture of superstition which seems naturally connected with a crude and imperfect state of knowledge. In many parts of the continent, the most savage and degrading rites are practised; and in all, the favour of the Deity is supposed to be gained rather by splendid donations, costly structures, and elaborate outward observances, than by purity of heart and life. The pure and refined system of Christianity, though it was first communicated to Asia, has not maintained its ground against these superstitious propensities. Two systems of faith divide Asia between them: one is that of Mahomet, which, by the arms of his followers and of the conquering Tartars of central Asia, has been thoroughly established over all the western tracts as far as the Indus. It even became, for centuries, the ruling religion in India, though without ever being that of the body of the people. The other is the Hindoo religion, divided into its two great sects of Brahma and Boodh; the former occupying the whole of Indostan, the latter having its centre in Thibet, filling all the east of Asia and Tartary, and penetrating even north of the Altaï.

SECT. V. *Industry and Commerce in Asia.*

3625. *The useful arts are cultivated in the Asiatic empires* with somewhat peculiar diligence. Agriculture is carried on with great industry and care, though by less skilful processes, and with much ruder machinery, than in Europe. A much smaller amount of capital, particularly in live stock, is employed upon the land. The cultivators scarcely rise above the rank of peasantry. The chief expenditure is upon irrigation; for, in all these tropical regions, water alone is required to produce plentiful crops. Asia has also a number of manufactures which, though conducted with small capitals and simple machinery, are not equalled in richness and beauty by those of any other part of the world. All the efforts of European art and capital have been unequal fully to imitate the carpets of Persia, the muslins of India, the porcelain of China, and the lacquered ware of Japan. Commerce, though fettered by the jealousy of the great potentates, is very active throughout Asia. The commerce of Europe is principally maritime; that of Africa principally inland. Asia combines both. Her interior caravan trade is very considerable, though much diminished since Europe ceased to be supplied by this channel. The native maritime trade on her southern coasts is also considerable, but the foreign trade, particularly that carried on by the English nation with India and China, has now acquired a superior importance.

SECT. VI. *The Asiatic Languages.*

3626. *The Asiatic languages are classed in seven groups.* I. The family of the Shemitic languages. II. The languages of the Caucasian region. III. The family of the Persian languages. IV. The languages of India. V. The languages of the region beyond the Ganges. VI. The group of the Tartar languages; and, VII. The languages of the Siberian region.

SUBSECT. 1.

3627. *The family of the Shemitic languages* may be divided into five branches: — 1. The Hebrew; 2. The Syriac or Aramean; 3. The Median; 4. The Arabic; 5. The Abyssinian.

3628. (1.) *The Hebrew branch includes the Hebrew, the Phœnician, and the Punic.* This appears contrary to the opinion of the learned writer whom we have quoted in the introduc-

tory chapter, Part III. ; and who shows that the Phœnicians descended from Ham. He might have added, that their city, *Sidon*, was named after the first-born son of Canaan.

3629. *The Hebrew*, considered in relation to three principal epochs, may be distinguished as forming three different dialects: the *ancient* or *pure Hebrew*, spoken and written from the earliest age of the nation until the Babylonish captivity, after which it ceased to be spoken, and became a learned language. The Jews have continued to use it as such, with more or less purity, until the present day. In this idiom are written the Scriptures of the Old Testament, ending with the prophecy of Malachi. The *Chaldee*, which is almost identical with the Syriac. This language was brought by the Jews from Babylon. They introduced into it some Hebraisms, and at a later period a few Greek words, and even Latinisms. It was spoken and written until the eleventh century. The oldest work in this language is Daniel; after which rank the Targum of Onkelos, the Targum of Jonathan, the Talmud of Jerusalem, and the New Testament. The *Rabbinical* dialect, formed by the numerous learned Jews of Spain, in the eleventh century, by a mixture of the Chaldee with the ancient Hebrew.

3630. *The Phœnician* was formerly spoken throughout the whole coast of Syria, from Egypt to Tripoli. It appears to have differed very little from Hebrew. The navigation, colonies, and commerce of the Phœnicians, as we have already observed, spread their language and writing over all the coasts of the Mediterranean, especially in Cyprus, Cilicia, Sicily, Spain, and Africa. The ancient medals of Tyre, Sidon, Acre, Berytus, Arad, and Marathus afford the means of ascertaining the ancient Phœnician alphabet; but no memorials respecting the literature of the nation have been discovered.

3631. *The Punic, Carchedonic, or Carthaginian*, appears to have been considered one of the dialects of the Phœnician. It was the language of the Carthaginians once masters of the whole north coast of Africa, part of Sicily and Spain, and the isles of Sardinia and Malta. It was spoken in Africa in the times of Jerome and Augustine, but has long been extinct. The voyage of Hanno, of which the Greek is an abridged translation, was originally written in this language.

3632. (2.) *The branch called Syriac or Aramean*; the latter name being derived from Aram, which in its scriptural acceptation includes Syria, Mesopotamia, Chaldea, and Assyria. This idiom formerly extended through Persia to Samarcand, and even into Tartary and central Asia, where it became known through the merchants and the religious sect of the Nestorians. Its principal dialects appear to have been the Palmyrene, the Nabathean, and the Sabian, used by those sectaries who are, strangely enough, called Christians of St. John the Baptist; and who are said not to believe in him whom their avowed leader proclaimed.

3633. *The Chaldee*, formerly current in Chaldea, and for many centuries extinct. It was spoken at the courts of Nineveh and Babylon; and in it were written the astronomical observations, the most ancient on historical record, which were found at Babylon by the philosopher Callisthenes. This language, learned by the Jews in their captivity, and by them mingled with the Hebrew, gave birth to the dialect called the *Chaldaic*.

3634. (3.) *The Median branch*; so named because the only language it comprises was spoken in ancient Media. This language is the Pehlvi or Phelvy, formerly in use throughout Western Persia, and on the banks of the Tigris. It was the written and current language of all the higher classes in the Persian empire, and was spoken at the court of its ancient kings. Its high antiquity cannot be questioned. Into it were translated the books of Zoroaster written in Zend, and these translations are perhaps as ancient as the originals themselves. The medals and inscriptions of the Sassanides are also in Pehlvi.

3635. (4.) *The Arabic branch* includes only one language, in which are to be distinguished the *ancient*, the *literal*, and the *vulgar* Arabic.

3636. i. *The ancient Arabic*; an idiom long extinct, was spoken throughout Arabia, in two principal dialects, the *Hamiar* and the *Koreish*. The *Hamiar*, spoken in the eastern part, is entirely unknown to us. It probably resembled the Axumite, and was written in an alphabet called Musnad, also extinct. The *Koreish* was spoken in Western Arabia, especially in the vicinity of Mecca. This dialect, improved by Mahomet and his successors in the seventh and following centuries, became —

3637. ii. *The literal Arabic*, common to the whole Arabian nation, and the written and literary language of most of the nations subject to the vast empire founded by the successors of Mahomet. In this language that code of imposture the Koran is written. Though it has long ceased to be spoken, it has continued to be the *liturgic* and learned language of all the numerous nations professing Islam, from the shores of the Indian Ocean to the westernmost corner of Morocco, and from the Wolga to Cape Delgado in Africa. From the ninth to the fourteenth century, while other nations were involved in darkness, the literature of the Arabs shone in its utmost splendour.

3638. iii. *The vulgar Arabic*, spoken in Arabia and in the greater part of Syria and Mesopotamia, in a part of Khusistaun or Fars; along the Persian Gulf; in the kingdom of Persia; in some parts of the Malabar and Coromandel coasts; in all parts of Egypt, in a part of Nubia, especially along the Nile; in all the towns of the Barbary states by the

Moors and Arabs, and in a part of their plains by the Bedoween Arabs; in a part of Beled-el-jereed; and in some of the oases of the African deserts. It is singular to remark that the name *Arab* is a mere geographical term; *Jesirat el Arab* meaning in this language the isle or peninsula of the *West*, which it is, when viewed in relation to the rest of Asia. By a more figurative appellation, the *Bedoweens* are designated "the sons of the desert." The simplicity of the worshippers at Mecca, long anterior to Mahomet, denominated according to their position the countries that lay on either hand, when the pilgrims took their way northward on their return. *El Yemen* was the country on the right, *El Xam*, or, as the French imitate the aspirate, *El Sham*, is the country on the left, which answers to Syria.

3639. *The nations that speak Arabic use every where the same words*; the dialects differ little from each other. They are, that of *Yemen*, considered the purest; that of *Mecca* and its neighbourhood, deemed to be one of the most corrupted; the *Bedoween*, spoken in a great number of subdialects and varieties by numerous wandering tribes; the *Syrian*, spoken in Syria and Mesopotamia; the *Maronite*, spoken in the country of the Maronites; the *Druse*, spoken in the country of the Druses; the *Mapul*, spoken by the Mapul tribes on the Malabar coast, and by the Chaliates on that of Coromandel; the *Egyptian*, spoken in Egypt and the neighbouring countries; the *Mogrebin*, or Moorish, spoken in the Barbary states; the *Mosarabic*, or Maranish, formerly spoken in Spain, during the dominion of the Arabs, but long extinct; and, lastly, the *Maltese*, a jargon composed of Arabic, Italian, and Provençal.

3640. The *Abyssinian* branch, so called because it comprehends the principal idioms of Abyssinia. All these may be subdivided into two classes, according to their greater or less affinity to the Axumite or to the Amharic. The Axumite comprises the ancient Gheez and the modern Gheez: the Amharic includes the Semian, the Arkiko, the Narea, and the Dembea.

SUBJECT. 2.

3641. *The languages of the Caucasian region* are thus classed: — 1. The *Georgian* family; consisting of the ancient and modern Georgian, the Mingrelian, the Suane, and the Lasian. 2. The *Armenian* family; including the *ancient* Armenian, now extinct, except in the literature and the public worship of the nation; and the *modern* or vulgar Armenian, spoken by the Haikans in Turkish and Persian Armenia, in part of Georgia and Shirwaun, and in the government of Istchil. 3. The *Lesghian* languages, including the Awar, the Kazikumuk, the Akusha, and the Kura. 4. The *Mixdjedghi*, spoken by the people of that name in southern Circassia, and comprising four principal dialects. 5. The *Circassian*, spoken by the Circassians or Cherkasses, whose true name is *Adije*, probably the Zyges of Strabo and the Ziches of the Byzantine writers. 6. The *Abassi* or *Absne*, spoken by the Abassi, now subjects of the Russian empire.

3642. *All the languages of the Caucasian region* are excessively harsh, and are remarkable for an extraordinary assemblage of consonants and an accumulation of vague and diphthongal sounds, many of them guttural. The Armenian and the Georgian are the only written languages: those who speak the others use in writing either the Arabic, the Georgian, or the Turkish idiom.

SUBJECT. 3.

3643. *The family of the Persian languages* consists of — 1. The *Zend*, spoken formerly in Bactriana, where it ceased to be the vulgar tongue before the Christian era. This is the language in which is written the *Zend-avesta*, the sacred book of the fire-worshippers, by whose priests, the Magi, it was spoken. The *Zend* may be considered as the parent of all the Persian idioms, perhaps even of that called by excellence the *Sanscrit* or *perfect* language. It possesses its peculiar alphabet, consisting of *forty-two* letters. It is written from right to left. It also employed the cuneiform characters, as in the inscriptions found among the ruins of Persepolis, commonly denominated by the Persians the *Cheyl Minar*, "the forty columns" (i. e. the *many* columns), and *Takht-e-Jemsheed*, "the throne of Jemsheed."

3644. (2.) The *Parsi*, *Farsi*, or ancient *Persian*. It had surpassed the *Zend* in copiousness, accuracy, and elegance, long before it became, under the Sassanides, the language of the court and of public business throughout the empire. Among its dialects may be distinguished the *Parsee*, spoken, or at least understood, by most of the Parsees or fire-worshippers, called *Guebre* or *Giaour*, infidels; a term, observes Gibbon (ch. lxviii.), "transferred from the Persian to the Turkish language, from the worshippers of fire to those of the crucifix," and applied not only to the Roman catholics, but to Christians of every denomination.

3645. (3.) The *Modern Persian*, derived from the *Parsee*, and formed, during the long domination of the Arabs in Persia, by the mixture of Arabic with *Parsee*, and some Turkish. It is spoken not only in Persia, but in a great part of India, where it is very common among the Mahometans, especially those of Agra and Aurungabad. It is also the language employed in the public documents, in the courts of record, and the finance-registers of the provinces which formed the vast empire of the Great Mogul. A dialect of it is spoken by

the people of Bukharia, and by those of the same nation scattered among the towns of Asiatic Russia, and in some provinces of China. It has very great analogy with the Slavonic, and still more with the languages of the Germanic family, not only in radicals and simple words, but in inflexions and grammatical forms. It has many other dialects.

3646. (4.) The *Kurde*, or *Coord* spoken in *Curdistaan* and *Luristaun*. The *Koords*, retaining the habits, and it is said the very costume, of their ancestors, the *Carduchi* of *Xenophon*, are divided into a great number of tribes, there being seventy-two in the government of *Diarbekir* alone. That it is spoken by the different tribes in *Luristaun* appears certain from the investigations of the celebrated *Mr. Rich* when English resident at *Bagdad*. The *Koordish* language differs little from the *Persian* in words, but much in grammar: it is harsh, and much less polished.

3647. (5.) The language of the *Ossetes*, inhabiting the high valleys of *Caucasus*, between the *Mizdjedghi* on the east and the *Basians* or *Emeriti* on the west, and shown by *Klaproth* to be descended from a colony of ancient *Medes*. In this language are several words common to the *Wotieque* and some other idioms of the *Arabian* family.

3648. (6.) The *Pooshto*, or *Afghaun*, spoken in several dialects by the numerous tribes of the *Pooshtaned*, known in *Persia* by the name of *Afghauns* and in *India* by that of *Patans*. It has much analogy with the *Persian*, and very little with the *Shemitic* languages. Its literature is very poor, and of no earlier date than three centuries ago.

3649. (7.) The *Belooch*, spoken by the dominant nation in *Beloochistaun* and *Sinde*. It has great affinity with the *Persian*, and may be divided into three dialects: the *Belooch proper*; the *Babe*, spoken by the people so named, a great part of whom live in the kingdom of *Caubul*; and, the *Sindy Belooch*, spoken by the *Belooches* dwelling in *Sinde*. This language, which is very little known, is written in the *Arabic* character, with some additional letters.

SUBSECT. 4.

3650. The languages of *India* may be divided into two principal branches:—1. Those forming the family of the *Sanskrit*; 2. Certain particular languages which do not belong to that family. In the first branch, a distinction must be made of the dead languages, or languages no longer spoken. These are, 1. The *Sanskrit*, meaning, in the *Indian* acceptation, perfect or complete. It was formerly spoken throughout the greater part of *India*; but it has been an extinct language for several centuries, and is now studied by the *Bramins* and *Indians*, as *Greek* and *Latin* are with us. Like the *Greek* and *German*, it has the property of forming compound words *ad libitum*, and has a great quantity of them. Its most ancient books are the *Vedas*, subdivided into eighteen *vidjas*, or parts, embracing all the branches of human knowledge, from theology to music; the laws of *Menu*, or the civil and religious code of the *Indians*; and the two epic poems called the *Mahabharata* and the *Ramayana*. The *Sanskrit* has a particular alphabet, called the *Dewanagari*, consisting of fifty-two letters. It is written from left to right, and is the model on which are formed several alphabets peculiar to the idioms of the *Indian peninsula*, that of the *Thibetians*, and those employed for writing several of the languages of *Indo-China*. 2. The *Bali* or *Pali*, also called the *Magada* or *Misra*. This language, which is regarded as a sister of the *Sanskrit*, was formerly spoken in *Magadha*, a part of *Bahar* south of the *Ganges*, by some considered as the native country of *Buddha*. It was widely spread in *India* before the *Christian* era, but became extinct when the sect which spoke it was expelled. Like the *Sanskrit*, it has long ceased to be spoken, though it has continued as the liturgic, hieratic, and literary language in the isles of *Ceylon*, *Bali*, and *Madura*, in a great part of *Java*, as well as throughout *Indo-China*, except the peninsula of *Malacca*. It is also the religious language of the numerous inhabitants of *China* and *Japan* who profess *Lamaism* and *Buddhism*. It has four principal dialects, the *Magadha* and the *Bali* proper, the *Fan* and the *Kawi*.

3651. The living languages of *India*, collectively called *Pracrit*, are many of them derived from the *Sanskrit*. In several, half the words are pure *Sanskrit*; the rest being composed of words partly belonging to foreign languages that are well known, especially the *Persian*, and partly to others imperfectly to be traced, with some *Sanskrit* words, altered by a regular system of permutation. The *Saraswata*, an *Indian* nation which has long disappeared, and which dwelt along the *Saraswati* in the *Punjab*, spoke a particular language, derived from the *Sanskrit*, and called *Pracrit*. The branch of the *Pracrit* languages appears at present to include, among numerous others, the *Hindoostanee*, the *Punjaube*, the *Cashmeerian*, the *Caubul*, the *Sindee*, the *Zinganee* (called in some parts of *Europe* the *Bohemian* or *Gipsy*), the *Kutch*, the *Malayalam*, the *Maldivian*, the *Cingalese*, the *Tamul*, the *Carnatura*, the *Telinga*, the *Orissa*, the *Bengalee*, the *Assamese*, the *Mahratta*, the *Bundelkhund*, and the *Malwahr*.

3652. (2.) Of the particular languages forming the second branch of the great *Indian* family as not belonging to the *Sanskrit*, the principal are the *Touppah*, the *Garow*, the *Choomeas*, the *Cattywar*, the *Gond*, the *Coteesghur*, and the *Wadasse*.

SUBJECT. 5.

3653. *The languages of the region beyond the Ganges* are divided into five branches:—1. The *Thibetan*, including the Thibetan proper, which is also the language of the Lamas or Mongol and Calmuck priests; the Uniyas; and the Bhutias. 2. The *Indo-Chinese* branch, comprising all the languages spoken in the peninsula beyond the Ganges called Indo-China or India Ulterior. In the still imperfect ethnography of this region, its languages may be divided into two classes; the polished and the written, and the rude and unwritten. Of the former class are the Aracan-Birman, the Moitaï, the Peguan, the Laos-Siamese, the Cambodian; and the Assamite, with its four dialects, the Tonquinese, the Cochin-Chinese, the Loyes, and the Lactho. Of the unwritten class are the Kolun, the Plaece, the Dhanu, the Samang, the Moi, the Andaman, and the Nicobar. 3. The *Chinese* branch, comprising the languages spoken in China and the neighbouring isles. This branch is divided into the languages of the *Chinese family*, and some particular languages. The Chinese family includes,—1. The *Kou Wen*, or ancient Chinese, supposed to have been formerly spoken throughout a great part of China. It is perhaps the most monosyllabic language in the world, and that which contains the greatest number of monophonous words. 2. The *Kouan Kou*, or modern Chinese, spoken in a multitude of dialects throughout all China Proper, and by the educated classes throughout the empire; also by the numerous Chinese established in Indo-China and Western Oceania, especially in Java, Borneo, Celebes, Timor, and Manilla. 3. The Ching Cheu, or Chang Cheu, spoken by the inhabitants of the province of Fo-kien. It differs from the Kouan Hou not only in the pronunciation, but in the etymology of words, and in grammatical construction. The *particular* languages of the Chinese branch are the Miaos, the Lolos, the Mien Ting, and the language of the interior of Hainan. 4. The branch called the *Sian-Pi*, or *Corean*. It includes one language, the Corean, spoken in the kingdom of Corea, and apparently in the neighbouring isles, by the Coreans; called by the Japanese *Sian Pi*. It has borrowed many words from the Chinese. 5. The *Japanese* branch is at present known to include only the languages spoken by the Japanese, and that which prevails among the people of the Loo Choo islands, distinguished as the only people on the globe unacquainted with the use of warlike weapons.

SUBJECT. 6.

3654. *The group of the Tartar languages* consists of three families:—1. The Tungusian; 2. The Tartar or Mongol; 3. The Turk.

3655. (1.) *The Tungusian family*, common to the ancient and modern people of Mandshuria, and to several tribes inhabiting eastern Siberia, is not known to include more than two languages: the *Mandshoo*, spoken in the Chinese empire by the Tunguses, who are and have been the dominant nation since 1644, when the ancestor of the reigning family was placed on the throne; and the *Tungus*, spoken by the Tunguses, who live in the Russian empire, scattered over more than a third of Siberia, from the Yeniseï to the Sea of Okhotsk.

3656. (2.) *The Tartar or Mongol family* comprises all the idioms spoken by the Tartars properly so called, subdivided into a great number of communities dispersed over Mongolia, Calmoukia, a part of Thibet in the Chinese empire, and several parts of the Russian empire. These idioms appear to form a family composed of at least three languages, the Mongol proper, the Calmuck, and the Bouriet.

3657. (3.) *The Turk family*, including the *Turkish*, the *Yakoute*, and the *Tchouwache*. The Turkish is spoken in a great number of dialects. The *Osmanli*, or Turkish proper, is spoken by the Osmanlis, Ottomans, or Turks: the *Kaptchak* by the pure Tartars as they call themselves, living in the Russian governments of Kasan, Simbirsk, Penza, and Saratov, and by the pretended Tartars, settled in those of Astrachan and Orenburg. The *Turcomaun*, spoken by the nomadic nation of Turcomauns, divided and subdivided into a prodigious number of branches: the *Caucaso-Danubian*, spoken in three principal sub-dialects by the Basians, the Koumouks, and the Nogais dependent on the Russian empire; the *Kirghis* and the *South Siberian*, spoken by various Turkish tribes inhabiting that region.

3658. *The Yakoutes*, who speak the language so named, are the most northern and most eastern of all the Turk tribes: the *Tchouwaches*, called by the Russians the *mountain-Tartars*, are most numerous in the governments of Kasan and Wiatka.

SUBJECT. 7.

3659. *The languages of the Siberian region* are thus classed:—1. The *Samoyede* family, which includes the different languages and dialects spoken by the nomadic nation of that name, part of which still inhabits the centre of Asia, and the others are scattered over its northern region from Olenok to the straits of Warjatz, and in Europe from these straits to the White Sea. 2. The *Yeniseï* family, so called from the river Yeniseï, by the philologist Klaproth, who classed the languages of which it is composed. The people who speak them, improperly called Ostiaks of the Yeniseï, live in the government of Tomsk, along that river and

its tributaries, from Abakansk to Touroukhansk, separating the Samoyedes of the south from those of the north. 3. The *Youkhagire*, spoken by the Youkhagi, or Adon Dommi, a nation now reduced to some hundreds of families, who have almost all embraced Christianity. 4. The *Koryeke* family, which includes the idioms spoken in the north-east of the government of Irkutsk by several communities called Koryekes, and some others, comprised under the denomination of Tchuktches. These tribes dwell to the east of the Youkhagires, and are surrounded by the real Tchuktches, by the Kamtchadales, and the Tunguses. 5. The *Kamtchadale* family comprises the idioms spoken in the peninsula of Kamtschatka, by the Kamtchadales, who call themselves *Itulmen* or *Itelmen*. Those who escaped the ravages of the small-pox in 1768, 1784, 1800, and 1801, have embraced Christianity, and adopted the Cossack manner of living. 6. The *Kurilian* family includes the idioms spoken by the Ainos or Kurilians, the aborigines of the Kurilian archipelago, the isle Taraikai, and part of Mandshuria. The languages comprised in it are the Kurilian proper, the Jesso, and the Tarakas.

SECT. VII. *Divisions of Asia.*

3660. *In dividing Asia into parts*, we may view it as consisting of Southern Asia, Middle Asia, and Northern Asia.

3661. *Southern Asia* comprises Asia Minor, Syria, and the other Asiatic parts of the Turkish empire; Arabia; Persia; Hindostan; India beyond the Ganges; China. To this division are appended the great Oriental archipelago, and the archipelago which constitutes the empire of Japan.

3662. *Middle Asia* consists almost exclusively of the vast regions of Tartary, divided into Chinese and Independent Tartary. To this may be added the Caucasian territory, situated between the Black Sea and the Caspian.

3663. *Northern Asia* consists wholly of an immense uniform plain, subjected to the sway of Russia, and bearing the name of Siberia.

CHAP. I.

TURKEY IN ASIA.

3664. *Asiatic Turkey* is a very extensive region. We have seen several of the finest portions of Europe, and some of the principal seats of ancient civilisation subject to the Turkish yoke. It is also extended over a number of the finest and fairest regions of Asia. No countries in the world are more favoured by nature, or more marked by grand historical features. Babylonia, Assyria, Armenia, Lydia, Syria, Judea; all these once renowned empires and kingdoms are now mostly included in Asiatic Turkey: which consists not so much of any one single country, as of several detached and dissimilar states, which the sword, wielded by fanaticism, has combined into one vast heterogeneous mass.

SECT. I. *General Outline and Aspect.*

3665. *The extensive territories thus united* are bounded on the west by the Mediterranean and the long succession of straits which connect it with the Euxine, and divide Asia from Europe. On the North they have the Black Sea and the Caucasian territory, where Turkey is conterminous with Russia. To the east is Persia, separated by a line varying with the fortune of war, but which at present nearly coincides with the course of the Tigris, beyond which the mountains of Kurdistan afford a doubtful and debatable ground. To the south a portion of the empire, nominally at least, touches the Persian Gulf, but is circumscribed by Arabia. Of that vast region, at the time when all Asia was yielding to the Ottoman power, the leading positions, particularly along the Red Sea, were occupied by Turkish garrisons; but it now defies them at every point, and pours its desolating bands over the fine plains of Syria and Bagdad. These vast precincts, taken in their greatest length from east to west, may comprehend about 12° of longitude, making in that parallel 1200 miles; from north to south, 11° of latitude, or nearly 900 miles in breadth; but it is so irregularly formed, and branches into so many angles, that the square of these dimensions could not be taken as an estimate of the superficial extent. In particular, a vast encroachment is made, and an almost complete separation of parts effected, by that vast expanse of Arabian desert which runs up between Syria and the Euphrates.

3666. *This wide region presents a peculiar variety of culture and aspect.* Its ranges of mountains are numerous, of great celebrity, and second in magnitude only to the gigantic

chains of Andes and Himalayah. Above that chaos of mountains, valleys, and torrents, which constitutes the kingdom of Armenia, primeval Ararat rears its snowy peaks, reminding mankind of the most memorable event in the physical history of the globe. The peninsula of Asia Minor is entirely girded with chains of mountains, leaving between them and the sea sometimes only narrow passes, sometimes broad and fertile plains; and enclosing wide ranges of high table-land which form the interior. Lebanon, the pride of Syria, though no longer crowned with its majestic cedars, contains in its recesses villages, culture, and varied vegetation, while its summits are crowned with perpetual snow. Judea is entirely a country of mountains, some wooded and cultivated, as Bashan and Carmel, others naked and rocky, as those which encircle the Dead Sea; but none of them rivalling the lofty heights of Lebanon or Ararat.

3667. *These high and numerous chains give birth to many large and celebrated streams; but none attain the character of rivers of the first magnitude, except the joint and boundary course of the Euphrates and Tigris. Both spring from the depths of Ararat, and in their early course dash through its dark and rocky glens, till they swell by degrees into great rivers. The Euphrates takes a long course westward, till by a wide circuit it becomes parallel to the Tigris, which has proceeded direct from its origin with a rapidity which is expressed by its ancient name of Teer, the arrow. Thenceforth the two rivers pursue a parallel course southwards, enclosing that large and celebrated plain, the Mesopotamia of the Romans, within which were situated Babylon and Nineveh, the most ancient capitals of the world. At length, above Bassora, the two streams unite their mighty waters, and form a broad channel, called Shat-ul-Arab, which, after a course of about 150 miles, pours itself into the Persian Gulf. The numerous branches, however, into which it is represented as separating, are said to belong not to it, but to the Karoon and other rivers of Khusistan, connected with it only by an artificial channel. If we consider the whole course, from its source to its mouth, as the Euphrates, it will possess a length of 1400 miles, forming, indeed, a very great river, yet not equal to its renown, derived chiefly from the ancient fame and civilisation of the regions through which it flows, and of the cities that have been founded on its banks. The course of the Tigris is not more than about 800 miles.*

3668. *All the other rivers of Asiatic Turkey are of secondary magnitude, and only distinguished by the brilliant historical and poetical associations connected with their names. The mountains among which they rise extending in long ranges parallel to and near the sea, they have not sufficient space to expand. The Kizil Irmak and Sikaria, far better known under the classic names of Halys and Sangarius, cross nearly the whole of Asia Minor, in their course to the Black Sea. The most western tract is still adorned by the beautiful windings of the Meander. The Scamander and the Granicus, notwithstanding their high place in history and song, can scarcely be named as geographical features. Orontes and Jordan, the rivers of Syria and Judea, attain a considerable course by flowing north and south along the back of Lebanon: the former falls into the Mediterranean; but Jordan terminates in the Dead Sea.*

3669. *Turkey in Asia cannot be said to be a country of lakes, though in some provinces they are a characteristic feature. Asphaltites lays claim, with some plausibility, to the appellation of sea. Tiberias, or the Lake of Galilee, enclosed by cultivated lands and wooded mountains, forms a rich and picturesque object. The beautiful lakes of Antioch and Damascus attract little notice on the great scale. Chains of saline lakes, of considerable magnitude, extend through some parts of the interior table-land of Asia Minor.*

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

3670. The reader is referred to the remarks under Chap. I. Sect. II. *antè*, p. 854.

SUBSECT. 2. *Botany.*

3671. This country, so interesting in an historical point of view, as being that portion of our globe where the transactions recorded in the earliest part of Scripture took place, is comparatively, owing to the jealous disposition of its inhabitants, but little known as to its individual vegetable productions: still, the labours of the learned enable us to give a tolerably satisfactory sketch of their distribution. As it is from hence that the arts and civilisation were carried to other regions of the earth, so are we indebted to this country, and the neighbouring one of Persia, for many of our most precious European fruits. The Walnut and Peach are from the last-mentioned kingdom; the Vine and Apricot from Armenia. The Cherry and the Sweet Chestnut from Lesser Asia, with the Fig, the Olive, and the Mulberry; our most ornamental garden plants, especially

“the garden’s queen, the Rose,”

of which one of the most esteemed varieties, the Damask Rose (*fig. 538.*), is supposed to have been originally brought, at the time of the crusades, from Damascus; the Hyacinth, the Tulip, several kinds of Iris, and the Ranunculus; to which we may add the Horsechestnut, the Lilac, the Sweet Jasmine, the Melon, and the Cucumber.

DAMASK ROSE.

east it reaches the plains situated between Bagdad (lat. $33^{\circ} 9'$) and Kermanshah; on the north it advances to Tekrid (lat. $34^{\circ} 40'$); on the west it casts its shadow over the ruins of Palmyra, and penetrates Palestine and Syria as far as the plains of the Mediterranean.

3673. Owing to a circumstance peculiar to the climate of Bagdad, neither the Henna (or *Chenna**), *Lawsonia inermis* (fig. 539.), the Banana, nor several other plants of the warmer zone, which grow

HENNA.

* The use of henna is of very remote date; its ancient name was Cypros. Among the mummies have been found several whose nails preserved the yellow colour still customary among the Orientals; unless, as Olivier suggests, this hue may have been imparted by the action of the bitumen used for embalming the body. The Arabs and Moors cultivate henna to the present day, and use it to dye their hair, and especially the nails of the hands and feet; also the back, the mane, and hoofs of their horses, and even a part of their legs: the women, especially, employ it as an ornament, but abstain from it at the death of their husbands and parents. The leaves of henna are gathered at the beginning of spring, then dried in the air, and reduced to powder, and applied in the form of paste to the parts which they wish to tinge. It dries in the course of five or six hours, and imparts a durable colour. The foliage is also used to cure recent wounds and abscesses.

The henna, according to Olivier, is the Cypros of the Greeks, and the Hacopher of the Hebrews. Its flowers have a strong penetrating odour, like that of chestnut or berberry. By distillation an extract is

elsewhere in higher latitudes, can be cultivated there with success. It is not because the temperature of the summer is insufficient; for the heat is excessive and unremitted. It is even said that the thermometer rises to 50° of Reaumur during the period, happily a very short one, when the *samiel* occasions desolation and death; but in winter the temperature falls sometimes to -2.5° , and perhaps even lower. Niebuhr saw at Bagdad, in February, 1765, ice two inches thick. These sudden colds, which the Orange tree is capable of bearing, destroy the Henna. Thus, Bagdad, in spite of its high medium temperature, which is estimated, perhaps incorrectly, at $+23.2^{\circ}$, presents only the vegetation of the northern limit of the Transition Zone.

3674. *From Bagdad to Moussoul* (lat. $36^{\circ} 28'$) the banks of the Tigris are fringed with Willows and Cucumbers. Beyond this narrow bend the soil is but a dry and burning sand.

3675. *Palestine and the south of Syria*, which spread like an amphitheatre along the shores of the Mediterranean, offer a most remarkable instance of the combination of the vegetation of hot and temperate countries. There may be seen together the Date, the Sugar-cane, the Banana, the Henna, the Orange and the Citron, the Pistachio, the Olive, the Carob tree, the *Cordia Myxa*, the *Guilandina Morinda*, the Indian Tamarind, the *Melia Azedarach* (commonly called Pride of India), the *Acacia nilotica* and *farnesiana*, with almost all the forest trees of Greece and Italy, and all the fruit trees of Europe. Each species fixes itself, according to its nature, on higher or lower plains, on the slope of the mountains, or on their summits.

3676. *The mountains in the interior of southern Palestine* form two chains, which run in a parallel line from south to north. In the low

SOLANUM SODOMÆUM.

part of the intermediate valley lies the lake Asphaltites, which receives the waters of Jordan. The west bank of this lake is bordered by rugged and barren mountains. At their foot Hasselquist found the *Solanum sodomæum* (fig. 540.), the fruit of which, destroyed internally by insects, preserves its colour, but contains only dust. The opposite shore is very fertile, and partly covered with large forests. Burckhardt remarked there the Gum trees (*Acacia* or *Mimosa*) and a tree of the family of *Apocineæ*, which the Arabs call Ochejir, and which, according to Delile, is the *Asclepias procera* of the Equatorial Zone.

3677. *To the north of the lake, along the eastern shore of Jordan*, lies a hilly country, more than 120 toises above the level of the river, and full of delightful scenery and uncommonly rich vegetation. The hills produce abundantly the Oak, the Pine, and the Wild Olive, &c. The streams which pour their

waters into Jordan, flow under the shade of Plane trees, Almonds, Olives, Oleanders, &c. The valley of Damascus and the shores of the Orontes are no less fertile.

3678. *In the absence of meteorological observations*, the vegetation of southern Syria suffices to assure us that its temperature can be little different from that of Cairo. It is not so with the northern districts, with Caramania and Anatolia. The annual variations in the temperature are increased by the influence of a more northerly latitude, to which may be added some peculiar and local causes of cold. This double action is evident at Aleppo, lat. $36^{\circ} 11'$. The Date tree does not grow spontaneously there, and the *Lawsonia alba*, with the varieties of Orange and Lemon, can only be cultivated by giving them shelter. The Myrtle and Oleander are only seen in a cultivated state. It is certainly possible that some cause may exist, independent of the winter's cold, which prevents the Myrtle and Oleander from growing wild at Aleppo, as these shrubs flourish without any such assistance in the Crimea, Istria, Italy, and Provence: and the former even stands abroad, without protection, in Cornwall, during the winter. The spring, summer, and autumn are very hot at Aleppo, especially in July and August; the thermometer varying from 25° to 28° . From the end of May to the middle of September, the power of the sun, aided by the dryness of the atmosphere, burns up all verdure; but these great heats are incapable of compensating for the inconveniences of a forty days' winter, during which it snows and freezes alternately. During Alexander Russell's residence of seventeen years in Aleppo, he thrice saw the frost so severe as to bear the weight of a man without the ice breaking.

3679. *It is no error to suppose* that local causes may affect the climate of Aleppo; since at Smyrna, 2° farther north, the Orange grows in profusion. Hasselquist even remarked some old stems of Date trees which had survived the winter: but he could not find any young

obtained from them, which is used in the baths, and with which the people perfume themselves on a visit, or during religious ceremonies, as marriage and circumcision, as well as at the festivals of Bairam and Courban-bairam. It was, no doubt, on account of their odour that henna flowers were scattered by the Hebrews in the apartments of a bride, and for the same reason the Egyptians keep them in their rooms. A considerable trade is carried on in henna leaves, which yields a large revenue to Egypt. Experiments made by MM. Descourtils and Berthollet go to prove that they might be advantageously employed in dyeing woollen stuffs of a yellow colour. For a description of this plant, see, further on, an account of some of the more interesting vegetable productions of the Holy Land.

ones. The latitude of Smyrna probably marks the utmost northern boundary of this equatorial tree. Every traveller remarks the absence of the Olive on the coasts, from the Dardanelles to Sinope: it reappears in the vicinity of that town.

3680. *The central part of Turkey in Asia*, comprehended between lat. 35° and 40° , is rural, elevated, and intersected by numerous ridges of mountains, of which the most important is Taurus. Though the summer be very warm, and the thermometer often rises in the plains and valleys to 30° , 35° , and even 40° , in the month of July, yet many of the productions of the south do not succeed there, on account of the winter cold. The ground is hardly free from snow at Erzeroum (lat. $39^{\circ} 59'$) till the middle of April; sometimes it even falls in June: the high situation of this town, 1500 toises, may occasion this. A few clumps of trees are thinly scattered on the plains. These were formerly clothed with forests; but since agriculture has been pursued there, the country is bare and unsheltered, and at a distance, almost appears sterile.

3681. *Generally speaking*, it is to the valleys and the slopes of the hills and mountains that the forests of Asia Minor are confined. The Pine, Fir, and Juniper occupy the most elevated spots: the *Larix Cedrus*, of which M. de la Billardi re fixed the boundary line on Lebanon at 991 toises, grows also on Mount Taurus. There are several species of Oaks; no country of the Old World produces so many: the greater number are of the evergreen kind. The Beech prevails in Caramania, Bithynia, Paphlagonia, Pontus, and Colchis, where many of our fruit trees, as the Plum, the Cherry, the Apricot, the Peach, the Almond, the Medlar, the Quince, the Apple and Pear, the Service tree, the Chestnut, the Walnut tree, and the Fig and the Vine, grow wild in the heart of the forests. It is doubtless from this favoured soil that most of these valuable trees have been derived that now adorn Greece, Italy, and the rest of the world. Vast tracts are covered with Olive, Myrtle, *Arbutus Unedo*, (or Strawberry tree), Terebinth, Lentisk, Pistachio trees, Laurels, Pomegranates, &c.

3682. *We should convey but an imperfect idea of Oriental vegetation*, if we did not enumerate the following species which compose the greater part of the forests. The names that are marked with an asterisk are such as have not been hitherto found in Europe or Africa.

3683. *Pinus halepensis*, *sylvestris*, and *Tournefortii**; *Abies orientalis** and *taxifolia*, *Larix Cedrus**; *Juniperus drupacea*, *f etidissima**, and *ph enicea*; *Cupressus sempervirens*, *Taxus baccata*, *Betula alba* and *pontica**, *Quercus Robur*; *Ilex coccifera*, *pseudo-coccifera*, *rigida*, *infectoria**, *Libani**, *Haliphleos**, *Tournefortii**, * gilops*, and * sculus*; *Fagus sylvatica*, *Castanea vesca*, *Ostrya vulgaris*, *Carpinus Betulus* and *orientalis*; *Populus alba*, *nigra*, *tremula*, and *euphratica**; *Salix babylonica*, *monandra*, *alba*, *fragilis*, &c.; *Platanus orientalis*, *acerifolia**, and *crinita*; *Liquidambar imberbe**, *Celtis australis* and *Tournefortii**, *Ulmus campestris* and *effusa*, *Osyris alba*, *El agnus angustifolia*; *Vitex Agnus*, *Fontanesia*, *phyllireoides**; *Fraxinus Ornus*, *excelsior*, and *rotundifolia*, *Arbutus Unedo* and *Andrachne*, *Diospyros Lotos*, *Styrax officinale*; *Tamarix orientalis*, *Africana*, *Germanica*, and *Gallica*; *Sambucus nigra*, *Cornus mascula*; *Pyrus Sorbus*, *Aucuparia*, *eleagnifolia*, *terminalis*, *saticifolia*, *Aria*, &c.; *Crat gus trilobata*, *Azarollus tanacetifolia*, &c.; *Prunus avium*, *Cerasus Padus*, &c.; *Amygdalus incana* and *orientalis**, *Mespilus germanica*; *Mimosa agrestis*, *Stephaniana*, and *Julibrissin**, *Cercis Siliquastrum*, *Ceratonia Siliqua*, *Paliurus australis*, *Zizyphus vulgaris*, *Ilex agnifolium*, *Juglans regia**, *Acer monspessulanum* and *heterophyllum* &c.

3684. The Olive, the Terebinth, the Pomegranate, the Sweet Bay, the Oleander, the Myrtle, the Fig, and the Vine, follow the shores of the Black Sea through Pontus, Mingrelia, and Colchis, and appear on the coasts of the Crimea, from lat. 44° to 45° . In these parallels, the lowest temperature scarcely reaches -6° ; but on the other side of the mountains which protect these countries from the northerly winds, the cold is so severe, that one might believe it was 4° or 5° nearer the pole.

3685. *As the Holy Land* constitutes so important a feature in the dominions of Turkey, we cannot close this account of the Botany of that empire without noticing more particularly some plants for which Palestine is celebrated: "a land of Wheat and Barley, of Vines and Fig trees and Pomegranates, a land of Oil (Olive), and Honey;" and in innumerable other places do the Scriptures bear testimony to the abundant vegetable products of the country.

3686. *The size of the Grapes*, mentioned in Numbers xiii. 23., of which "one cluster was borne by two men, upon a staff," might almost lead to a suspicion that the fruit was that of some other plant different from what we now call the Vine, were it not for the testimony of modern travellers. Stephen Schultz relates, that at a village near Ptolemais, he took his supper under a large vine, of which the stem measured a foot and a half in diameter; its height was about thirty feet; and, including its wide-spreading branches, which required to be supported, it formed a tent of above fifty feet in breadth and length. The bunches of grapes produced by this and similarly large vines weigh from ten to twelve pounds, and the individual berries are like small plums. When such a cluster is cut, the inhabitants place it on a table or board, about an ell and a half wide, and three to four ells long, and, several sitting around it, they pull off and eat the fruit. Christopher von Neitzschütz assures us

that he has seen bunches of grapes in the mountains of Judea which measured half an ell long, and the berries were as long as two joints of the finger. This is corroborated by Mariti, who relates in his travels that none of the produce of the Vine, as it is known in other countries, can vie with the grapes of Judea and Syria, of which one man certainly could not carry a cluster far without destroying the fruit; thus rendering it probable that the spies conveyed the bunch between them, as much in order to preserve it entire, as on account of the weight, so that the beauty of the grapes might be fully seen in the camp of the Israelites.

3687. *With the grapes of the true vine* must not be confounded the vines of Sodom and Gomorrah:—"For their vine is of the vine of Sodom and of the fields of Gomorrah: their grapes are grapes of gall, their clusters are bitter:" and again, "Wherefore, when I looked that my vineyard should bring forth grapes, brought it forth wild grapes?" This is supposed to be a species of Nightshade, which bears its berries in bunches, the *Solanum Sodomæum*; and according to Hasselquist produces the apples of Sodom spoken of by Josephus in his *Wars of the Jews*, which, besides their widely different properties from the vine, have the fruit frequently destroyed by the attacks of an insect, and thus rendered full of dust (see p. 874.).

3688. *The fig tree (Ficus Carica)* abounds in Palestine, and not in gardens only, but growing in open places. Besides the branch with one cluster of grapes, borne between two upon a staff, and brought by the men who were sent by Moses from Paran to spy out the land of Canaan, there were "Figs and Pomegranates." So that, if not aboriginals of the country (and their native place has long been a matter of dispute), we know that these fruits existed there before the entrance of the Israelites. Josephus tells us that they have figs for ten months in the year; and it is certain that two or three crops are gathered annually. "For, lo, the winter is past; the rain is over and gone; the fig tree putteth forth her green figs," preparatory to the first crop, which sets about the spring equinox, and ripens about June: these are reckoned great delicacies, and are of short duration, as expressed in Isaiah, "The glory of Ephraim shall fade like the early fruit" (figs?). Jeremiah saw in a vision "a basket of figs that were very good, like *early figs*." The summer figs set in the middle of June, when the early ones ripen, and are themselves in perfection in August. The third crop is ready late in the autumn, when the tree has shed its leaves. In mild winters, fruit may be found on the trees even so late as January. Figs are eaten both fresh and dried. To render the fruit more certain of ripening, the process of caprification has been employed; and the advantage of this is very evident, when we consider the true nature of the fig. What we commonly esteem the fruit of a fig is no fruit at all, any more than the substance which is eaten of the common artichoke. Both of them are receptacles, or a fleshy base, upon which a number of florets are inserted. In the artichoke, the receptacle is plane, or nearly flat; and, consequently, all the florets that are placed upon the receptacle are visible without dissection. Now, the fleshy part of a fig, that part which so much resembles a pear, is also a receptacle, but hollowed out in the centre in a very curious and peculiar manner: and on the surface of that hollowed part are innumerable florets, male or female, or sometimes both, within this common receptacle. And the whole is so closed at the top, that it may easily be supposed that, in the case of the receptacle containing only female flowers, the male dust could hardly find access to them; and if there be mixed flowers, a more free passage for the air must be requisite. Even in France, it is well known that the quality of a fig is improved by making perforations in the top of it. The Eastern nations do more than this. Caprification is by them performed by going to the woods, and thence collecting from the wild fig trees a little insect which is very abundant, a species of *Cynips*, and bringing it home to their cultivated figs. These minute creatures fall to work directly, piercing the fruits, in order to deposit their eggs within them; and fluttering from one to another, with their limbs and wings all charged with pollen, they by this means convey fertility to the otherwise barren pistils.

3689. *The sycamore tree (fig. 541.)* of Scripture, into which Zaccheus climbed, must not be confounded with the tree so called in our country. It is a species of fig (*Ficus Syca-*

SYCAMORE.

morus), and is sometimes termed the Wild Fig tree; although it is the true sycamore, its name being derived from *sycos*, a fig tree, and *moros*, a mulberry; but this appellation is now generally, though very incorrectly, given to the *Acer Pseudo-Platanus* of Europe. The prophet Amos says, "I was no prophet, neither a prophet's son; but I was an herdsman, and a gatherer of sycamore fruit." From this and from other passages in Scripture, it may be inferred, that this tree was of very great importance among the Jews; although its fruit is extremely inferior to that of the true fig, for it has a disagreeable bitterness; nay, it is said by Pliny and other naturalists to be intolerably nauseous, until rubbed with iron combs, after which it ripens in four days. This evidently alludes to the process of caprification. Theophrastus observes, that, when the fruit is mature, it should be pulled some days before it is eaten. Abdollatif says, that, previous to gather-

ing the figs, a man ascends the tree with a punch, and pricks all the fruits with it, one after another: a kind of milky fluid oozes from this opening, and the wounded part afterwards turns black, and in a few days after the fruit becomes sweet and fit for use. This is indeed the only one (besides the *Ficus Carica*) of all the 120 species of Fig, of which the fruit is eatable, and a vast quantity is consumed by the Arabs and the natives of the Levant. It forms a large tree, said to be among the loftiest in Palestine, with heart-shaped angular leaves, whose wood is of considerable value, and alleged to be indestructible: of this we have a proof in the fact of the Egyptian mummy-cases being made of this wood. And so abundant were these trees in Palestine, that, in allusion to the building of the temple, it is stated that Solomon "made cedars to be in Jerusalem as the sycamore trees that are in the valley for abundance:" so plentiful, indeed, were they, that "David set overseers over them, and over the olive trees that were in the low plains he set Baal-hanan the Gaderite." Yet they were sometimes destroyed by the frosts. The fallen state of the Jews, and their future prosperity, are thus typified by Isaiah: — "The bricks are fallen down, but we will build with hewn stones; the sycamores are cut down, but we will change them into cedars."

3690. *The Pomegranate* (*Punica Granatum*) is common in Syria and Palestine, particularly in all the gardens of Aleppo. The ripe fruit is in abundance in August, and is then laid up for a winter stock. There are three sorts; a sour kind, a moderately sweet kind, and a very sweet kind. The juice of the first is used instead of verjuice, or the juice of the unripe grapes. The others are eaten at table, after being cut open, the seeds taken out, strewed with sugar, sprinkled with rose water, and served up on little plates. The pomegranates, on account of their round and graceful figure, formed a frequent ornament in the chapiters of the building of the Temple: — "And the chapiters upon the two pillars had *pomegranates* also above, over-against the network; and the pomegranates were 200, in rows round about." They were also embroidered upon the hem of the high-priest's ephod. A wine is sometimes extracted from these fruits, and probably was so by the ancient Jews, as may be inferred from the word "Gath-Rimmon," signifying "the press of pomegranates." The seeds, according to Russell, constitute an important culinary article, being used for conserves and syrups. This fruit was much prized by the Israelitish people, as appears not only by its description among the products of the land of Canaan, but also by the murmuring of the tribes when they came into the desert of Zin. "Wherefore," said they, "have ye made us to come out of Egypt into this vile place? It is no place of seed, or of figs, or of vines, or of pomegranates." We must not judge of the Pomegranate from the stunted specimens cultivated in England: in warmer countries it constitutes a tree, and several towns and places have derived the name of "*Rimmon*" from the abundance or excellence of this production.

542

FRUIT OF THE CAROB TREE.

"Saul dwelt at Gibeah, under a *pomegranate* tree which was in Migron." The bark has been used in dyeing, and yellow morocco leather is thus stained.

3691. *The "HUSKS," in Scripture, which "the swine did eat,"* in the affecting and beautiful parable of the Prodigal Son, in Greek *κερατια*, are generally, and with much propriety, considered to be those of the fruit of the Carob tree, or Locust tree (*fig. 542.*)

(*Ceratonia Siliqua*); sometimes called St. John's Bread, from an idea that its fruit was the Locusts eaten by the forerunner of our Saviour; but as Locusts have from time immemorial been the food of the people of the East, that word may, very fairly, be taken in its literal sense. The Carob forms a middle-sized tree, not unfrequent in the gardens of the curious in England: it belongs to the natural family Leguminosæ, having large pinnated leaves, with inconspicuous flowers, rather large pods, and seeds embedded in pulp. The husks are still commonly employed for feeding cattle in Palestine, after the seeds are taken out, and the juice is pressed from them, which is much esteemed, and used for preserving fruits. Mixed with liquorice root, dry grapes, and other fruit, the Mussulmans make sherbet of it, and it is with them an article of daily consumption. The pulp, too, is eaten after the seeds have been thrown away: it is dried in the sun, acquires a pleasant flavour, and contains a great deal of saccharine matter. The leaves and bark are used for tanning skins.

3692. *The Palm tree of Scripture*, generally spoken of, is the Date Palm (*Phoenix dactylifera*), and its fructification requires the assistance of art. Theophrastus and Pliny allude to this process in terms which go to prove that the ancients had some knowledge of the sexes of plants, and the fertilisation of vegetables. In the East, and in Barbary, as soon as the Date trees begin to flower, the inhabitants carefully collect the male clusters before the pollen has escaped, and, climbing to the top of the female trees, they shake the male blossoms over them; and then fasten some bunches of male flowers in the middle of the female ones. By this process the successive fecundation of the several clusters of the date, which appear one after another, is ensured. The Date trees of Cairo, says Delile, in his *Flora of Egypt*, bore no fruit in the year 1800, because they had not been fertilised as usual. The French and Mussulman troops were at war during the spring, and the labours of the agriculturist had ceased in the desolated plains. Thus the pollen of the Date trees, scattered by the wind,

instead of being artificially carried, as was customary, to the female trees, failed to fecundate a single cluster of cultivated dates: but its influence was seen on the wild Date trees, several of which, though at considerable distances, bore fruit, though this fruit was so small and sour as to be unfit for food. The poet Pontanus has sung in glowing terms the history of two Date palms, of which the female was cultivated at Otranto, and the male at Brindisi; that is, at a distance of fifteen miles from one another. In spite of this immense interval, the Date tree of Otranto was fertilised by the other tree, and produced an abundance of delicious fruit. The winds performed the task of conveying the fecundating dust from the male tree into the young ovaries of the female. Many similar instances are recorded. Four or five months after the fertilisation has taken place, the Date trees begin to bend under the weight of their bunches of ripe fruit. The number of these clusters vary considerably. There are generally three or four on each tree, though some individuals have produced ten or twelve. Each weighs from twenty to fifty pounds. Before the fruit has acquired its full size, it is requisite to raise the clusters, and tie them to the base of the leaves, so that they may not be shaken and bruised against one another by the force of the wind. The dates must be gathered some days before they are perfectly ripe, or they speedily decay and ferment. When it is desirable to keep them for any length of time, they are spread on mats, and dried in the sun, and these are the dates that are sometimes seen in Europe. But the fruit, so parched, gives a very inadequate idea of the sweet and agreeable flavour that is found in the ripe and freshly gathered dates. They also prepare a kind of paste, by pressing the fruits very hard, and putting it in baskets made of the leaves of the tree, which are generally carried by the caravans. Jericho was called the city of Palms, from the number of Date trees in the neighbourhood; but they are now comparatively rare. They were emblematic of Palestine on the Roman coins, "where lone Judea wept beneath her palm," with the inscription "*Judæa Capta*." We shall not enter into a history of the uses of this celebrated and most valuable plant, for that may be found in various well known publications; but we shall content ourselves with observing, that, on account of its evergreen foliage, it has been considered by the Psalmist as an apt emblem of the flourishing and happy state of "the righteous," who "shall flourish as a palm tree;" and that palm branches or leaves (for palms have no branches) have been borne as indicative of joy and festivity, as is often mentioned in the book of Maccabees; and when our Saviour entered Jerusalem, the people "took branches of the Palm tree, and went forth to meet him." At the feast of Tabernacles, the Jews, as is well known, had a divine command to employ "goodly palm branches" in the erection of booths; and to this day, on the celebration of that festival, the Jews try, by every means, to procure dried ones, when living remote from the countries where they grow. In one part of the south of France, the sale of these leaves forms a staple article of trade. The village of Bordighiera, situated on an eminence sheltered towards the north by the Apennines, presents, from a distance, the aspect of a tropical spot, on account of the numerous Date trees which surround it. These are from forty to forty-five feet high; their fruit is seldom ripened sufficiently for eating; and it is for the sale of their leaves that these trees are cultivated. They are sold at two periods of the year, in spring for Palm Sunday, and in September for the Jewish Passover. The spring leaves are sold at 6*d.* or 7*d.*, Genoese money; but their price is annually falling, as the custom of substituting the branches of other trees for the Palms is much increasing in catholic countries. It is chiefly to the coasts of Italy, to Rome and Naples, that the palms of Bordighiera are sent. Those gathered in autumn, and destined for the use of the Dutch Jews, who adhere strictly to the letter of the law, yet cannot obtain recent Palms, fetch a higher price; they are sent off in parcels of 600, at 10*d.* or 11*d.* each. Many vessels are annually employed in this trade.

3693. *The Olive (Olea)* attains to a large size in Palestine, and the country has been considered eminently blessed for the abundance of this tree, and for the excellence of its oil, which the Israelites conveyed to the markets of Tyre. Solomon is said to have ordered to the workmen that king Hiram sent him, besides other provisions, 20,000 baths of oil. But the oil here spoken of, is supposed to have been not expressed from the cultivated olive. Schultz found near Jericho, in the bed of a brook that was dried up, several wild Olive trees, whose fruit was as large again as that of the cultivated kind, and from these the natives extracted an oil, which they used not for food, but as medicine.

CEDAR

3694. *The Cedar* (fig. 543.) must not be omitted in an enumeration of the interesting plants of the Holy Land; it is a fir of the group of the Larches, and hence called by some authors *Pinus Cedrus*, and by others *Larix Cedrus*. It is remarkable for its stately size, its wide-spreading fan-like branches, and its not deciduous leaves, in which latter particular it differs from all the other larches. It is a native of several places in the Levant, and especially of the famed Mount

Lebanon, which has been celebrated from the most ancient times for its cedars. The temple of Jerusalem and the royal palace there were built of this wood; and in the last structure, so great a quantity of this tree was employed, that it was called the House of the Forest of Lebanon. Masts of ships were made of it at Tyre; and so important was it to the ancient Jews, that the Psalmist compares the boughs of "the vine brought out of Egypt" to the cedars of God ("goodly cedars," in our translation). Pococke measured a stem that was twenty-four feet in circumference. Abundant as were the cedars in Lebanon during the days of Solomon, they are now greatly reduced, and confined to the steep declivity of the more elevated parts of the mountain, in the neighbourhood of the Carmelite monastery of St. Sergius. Mayo, in the summer of 1813, calculated the number of trees, of which this grove consists, at 800 or 900, large and small. Among them were nine principal cedars, whose circumference, at four feet from the ground, was nearly twenty feet; so that it is with some justice that Professor Martyn has remarked that we have probably now more cedars in Britain, than there are in all Palestine. It is hardly necessary to remark, that the cedar wood, of which pencils are made, is not the produce of this tree, but of a species of juniper (*Juniperus virginiana*), called the red cedar.

3695. The Terebinth tree (fig. 544.) is often mentioned in Scripture: this is the Pistachia

544

TEREBINTH.

Terebinthus of Linnæus, if Celsius be correct in calling the Oak of our translation his Terebinthus judaica; and Rosenmüller, to whom we are indebted for much valuable information respecting the natural history of Scripture, informs us that the words El-Elah, in our Bible rendered oak, are particularly applied to the Terebinth. Jacob buried the idolatrous images that his family brought from Mesopotamia under a Terebinth tree. An angel appeared to Gideon under a Terebinth tree. It was in a valley of Terebinth trees that Saul encamped with his host, and under one of them were he and his sons buried. Absalom hung upon a Terebinth tree, and Isaiah threatens the idolaters (ch. i. v. 30.), that they shall be as a Terebinth tree whose leaves fall off; that is, being an evergreen, when the tree dies. On account of their great age, they are employed metaphorically to indicate the prosperous and enduring state of the Jews when they were to be again restored. One of them, under which Deborah is said to

have dwelt, according to Josephus, was shown near Hebron at the time of St. Jerome. Towards the middle of the seventeenth century, between Jerusalem and Bethlehem stood an old tree, under which tradition relates that the Virgin Mary rested, when she went from Bethlehem to Jerusalem, to present her son in the Temple; and this was equally venerated by the Mahometans as by the Christians: but in 1646 it was accidentally destroyed by fire. The wood of the Terebinth tree is white, hard, and abounding in resin. The turpentine is obtained by making incisions, which should be done annually, else the accumulated fluid swells, and finally bursts and destroys the tree. From the neglect of this practice, Terebinth trees, which used to be so frequent in Judea, are now become of rare occurrence.

3696. Gladly as we would enlarge upon the subject of the plants of the Holy Land, want of space compels us to be brief. The Plane tree (*Platanus orientalis*) (fig. 545.) is abundant in Palestine, and is supposed by some commentators to be the same as the poplar, which yielded the rods that Jacob placed before the sheep in the watering troughs. The thorns

545

PLANE TREE.

with which our blessed Lord was crowned were the spiny branches of Zizyphus Spina Christi (fig. 546.), a frequent inhabitant of the Holy Land. Among the plants producing odoriferous gums or oils, of which the Balsam, or Balm of Gilead, or of Mecca, is the most celebrated, are the Amyris gileadensis (fig. 547.) and A. Opobalsamum

546

SPINA CHRISTI.

547

AMYRIS GILEADENSIS

of Linnæus; but these do not appear to be natives of Syria or Palestine, whatever they may have been of Arabia, the peculiar country of the precious balsams. Strabo, indeed, mentions a balsam garden at Jericho; and Judah is said in Scripture to have traded in wheat, oil, and balsam (or resin, as the margin has it); but whether the Amyris or not, must admit of great doubt. Gum ladanum is yielded by *Cistus Ladaniferus*, and is supposed to be the Lot of the Hebrews, and among the spices which the Ishmaelitic merchants brought from Gilead to Egypt. It is a beautiful and well-known plant in our gardens. The gum or resin is

548

GALBANUM.

found on the branches, and being soft and clammy early in the morning, the goats are driven in among the plants, and it adheres to their beards. Myrrh and frankincense are the products of Arabian plants. Galbanum (*fig. 548.*) an ingredient in the incense of the sanctuary, was procured from the *Bubon Galbanum*, an umbelliferous plant of Syria. What particular Rose, "the Rose of Sharon," and the "Rose plant in Jericho," is, it is perhaps impossible to conjecture. The plant, vulgarly known under the name of the Rose of Jericho, is no rose at all, but a small cruciferous plant, a native of the deserts of Arabia, the *Anastatica hierochuntica* (*fig. 549.*). After flowering, and when the seeds approach maturity, this plant dries up, its leaves fall, the branches, which are rigid and thorny, shrink together, and form a kind of round tuft, about the size of a man's fist. In this state, the *Anastatica* is driven by the winds, which tear it up by the roots, across the deserts, and as far as the sea shore, and is brought to Europe, where it is

designated as the Rose of Jericho or hygrometric Jerosa. The most ridiculous fables were invented respecting this plant, at a period when superstition greedily received them. It is an undoubted and remarkable fact, that the Rose of Jericho opens and extends its branches

549

ANASTATICA HIEROCHUNTICA.

when immersed in water, or when the atmosphere is very damp, and resumes its former appearance when exposed to the wind or to heat.

3697. To sum up all in the words of *Malte-Brun*, speaking of the state of the country, and of its most useful productions:—"It has been remarked, that if the advantages of nature were duly seconded by the efforts of human skill, we might, in the space of twenty leagues, bring together in Syria all the vegetable riches of the most distant countries. Besides wheat, rye, barley, beans, and the cotton plant, which are cultivated every where, there are several objects of utility or pleasure, peculiar to different localities. Palestine, for example, abounds in *Sesamum*, which affords oil, and in *Dhoura*, similar to that of Egypt. Maize thrives in the light soil of Baalbec, and Rice is cultivated with success along the marsh of Haoulé. Within these twenty-five years the

Sugar canes have been introduced into the gardens of Saida and Beirout, which are not inferior to those of the Delta. Indigo grows, without culture, on the banks of the Jordan, and only requires a little care to secure good quality. The hills of Latakia produce Tobacco, which creates a commercial intercourse with Damietta and Cairo. This crop is at present cultivated in all the mountains. The White Mulberry forms the riches of the Druses, by the beautiful silks which are obtained from it: and the Vine, raised on poles, or creeping along the ground, furnishes red and white wines, equal to those of Bordeaux. Jaffa boasts of its Lemons and Water-melons; Gaza possesses both the Dates of Mecca and the Pomegranates of Algiers. Tripoli has Oranges which may vie with those of Malta; Beirout has Figs like Marseilles, and Bananas like St. Domingo; Aleppo is unequalled for Pistachio nuts; and Damascus possesses all the fruits of Europe, Apples, Plums, and Peaches growing with equal facility on her rocky soil. Niebuhr is of opinion that the Arabian Coffee shrub might be cultivated in Palestine." (Vol. ii. p. 130.)

SUBJECT. 3. Zoology.

3698. The native zoology of Asiatic Turkey does not present us with any remarkable species that are not equally found in the adjacent extremities of Africa and Asia. The lion was once

550

ANGORA SHEEP.

common in Syria, and, according to Oppian, formerly over-ran Armenia; but this formidable creature is now, as M. Cuvier observes, almost confined to Africa and some parts of Asia. We have determined the fact of the African Lion (*Leo africanus* Sw.) being a distinct species from that of Asia, which we have therefore named *Leo asiaticus*. Noble specimens of both are now alive in the Surrey Zoological Gardens (1833). Angora is celebrated for its peculiar breeds of goats and of cats.

3699. The Angora Goats are very beautiful: the hair, mostly white, is long and soft, and much esteemed for fabricating shawls and other dresses: it has long buff-coloured ears, and the horns, pointing upwards, have a spiral turn.

3700. *The Angora Sheep* (fig. 550.) are also peculiar. There are three breeds, all well proportioned, called Coquo Muana, Coquo, and Zomba, in all which the horns are small. The Coquo has the finest wool, that of the others being more hairy. They all have very long tails, but the ears are horizontal.

3701. *The cats* are much larger than ours, with beards like the lynx, and, although seldom seen in this country, are common in the houses of Paris.

SECT. III. *Historical Geography.*

3702. *To detail the revolutions of the countries* now comprehended in Asiatic Turkey would be little less than detailing those of the world. Down to the capture of Constantinople by the Turks, in 1453, they were the scene of the greater part of the events which decided the fate of mankind. These revolutions, indeed, are so well known, that it is scarcely necessary even to indicate them to the intelligent reader. First to be noticed are the numerous little states in Canaan subdued by the Jews, and those which continued as their neighbours. At last Judea absorbed nearly all these states, and had for its enemy only Syria, and for its friendly neighbour, Phœnicia, with its splendid commercial capital, Tyre. In Asia Minor we find a similar multitude of small states, — Ionia, Æolis, Lydia, Caria, and many others. Then comes the era of the great empires, commencing with Assyria, and continued by Babylon, both founded in this region, and both yielding to the Persian empire, which, under the conquering arms of Cyrus, extended itself beyond any former state; reaching over all western Asia, including Egypt, and attempting to overpower Greece. But its contests with this last power had a fatal issue. The phalanx of Macedon, trained by Philip and led by Alexander, overthrew at one blow this colossal but ill-compacted and enfeebled power; and a Greek empire was established from the Nile to the Indus. When that mighty mass of conquest went to pieces with the sudden disappearance of its head, the kingdom of the Seleucidæ was formed, which included nearly the whole of what is now termed Asiatic Turkey, with the exception of some portion of Asia Minor. Amid the confusion of wars and contests which ensued among Alexander's successors, Asia Minor became not only independent, but the seat of some very potent and celebrated monarchies, — Pergamus, Pontus, Armenia; each of which might have even aimed at general monarchy, had not a mightier foe appeared in the field. To Rome all the nations that had ruled Asia were destined to bow; yet none maintained a harder struggle, or fell with greater glory, than Antiochus, Mithridates, and some others of these kings newly risen to greatness. Asia Minor, Syria, Judea, were completely reduced to the condition of provinces; but whenever her legions attempted to pass the desert, and were involved in the wide plains beyond the Euphrates, they were enveloped by the flying clouds of Parthian cavalry, and their career was closed with signal disaster. Western Asia, under the Roman government, enjoyed for many centuries a peaceful and voluptuous repose. This was broken, in the seventh century, by that mighty revolution which has changed the whole aspect, moral and political, of the Eastern world. The empire of the caliphs, established at Bagdad, soon ruled, with absolute sway, Syria and Assyria. Even after this original kingdom had yielded to the pressure of those numberless hordes who, under the appellation of Turks or Toorks, poured down from the northern interior of Asia, they all equally fought under the law and standard of Mahomet. The vanquished were either compelled to embrace his religion, or reduced to a subject and degraded class, deprived of almost all the rights of humanity. These successive irruptions continually hemmed in more closely the Eastern Empire; and, even after the Turkish power seemed completely fallen, it broke forth under the Ottoman dynasty with increased vigour. At this era, however, the progress of Moslem domination received a temporary check, by that series of powerful expeditions from Europe so celebrated under the title of *crusades*. The crescent was, for the time, humbled: Jerusalem was rescued, and erected into a kingdom, which subsisted for about a century. At length all the Christian powers in the East gave way before the victorious arms, first of Saladin, and afterwards of Mahomet and Selim. In the course of the fifteenth century, all that part of Asia of which we are treating terminated its long series of revolutions by becoming a portion of the Turkish empire: it has ever since been subject to the degrading and brutalising sway of this empire, and of the austere and bigoted religion on which it is founded. Under this influence, that grandeur and prosperity which rendered it the most celebrated region of the world has entirely disappeared. Volney, who traversed it with the eye of a philosophic observer, has painted its downfall in the most eloquent and affecting terms. "Every where," says he, "I saw only tyranny and misery, robbery and devastation. I found daily on my route abandoned fields, deserted villages, cities in ruins. Frequently I discovered antique monuments, remains of temples, of palaces, and of fortresses; pillars, aqueducts, and tombs: this spectacle led my mind to meditate on past times, and excited in my heart profound and serious thought. I recalled those ancient ages, when twenty famous nations existed in these countries; I painted to myself the Assyrian on the banks of the Tigris, the Chaldean on those of the Euphrates, the Persian reigning from the Indus to the Mediterranean. I numbered the kingdoms of Damascus and Idumea, of Jerusalem

and Samaria, the warlike states of the Philistines, and the commercial republics of Phœnicia. This Syria, said I, now almost unpeopled, could then count an hundred powerful cities. its fields were covered with towns, villages, and hamlets. Every where appeared cultivated fields, frequented roads, crowded habitations. What, alas! is become of these ages of abundance and of life? What of so many brilliant creations of the hand of man? Where are the ramparts of Nineveh, the walls of Babylon, the palaces of Persepolis, the temples of Baalbec and Jerusalem? Where are the fleets of Tyre, the docks of Arad, the looms of Sidon, and that multitude of sailors, of pilots, of merchants, of soldiers? Where are those labourers, those harvests, those flocks, and that crowd of living beings, which then covered the face of the earth? Alas! I have surveyed this ravaged land. I have visited the places which were the theatre of so much splendour, and have seen only solitude and desertion. I have sought the ancient nations and their works, but I have seen only a trace, like that which the foot of the passenger leaves on the dust. The temples are crumbled down; the palaces are overthrown; the ports are filled up; the cities are destroyed; and the earth, stripped of its inhabitants, is only a desolate place of tombs." Although this picture is overcharged in some of its features, its general character applies but too truly to the region now before us.

SECT. IV. *Political Geography.*

3703. *The principles and mode of government* are exactly the same in Asiatic as in European Turkey. The pachas, invested with the command of extensive territories, receive entire the power of the original despot from whom they derive their appointment. Their distance, indeed, affords them much more ample opportunities of acting independently, and of merely transmitting to the Porte such an amount of tribute and military aid as they can conveniently spare. Even Asia Minor, which is now the centre of Turkish power, has been the seat of formidable rebellions; and Paswan Oglou long governed an extensive tract of its western districts with little or no control from the Porte. The more remote pachalics of Acre and Bagdad have almost completely shaken off the yoke. The independence of the former dates from Daher Omar, in the middle of the last century, and was maintained still more completely under the ferocious Djezzar. Since the period first mentioned, the Porte has derived neither force nor revenue from an appanage which includes nearly the whole of the ancient Judea. A similar independence was earned by Ahmed, Pacha of Bagdad, after his gallant defence of that city against Nadir Shah, and afterwards against his successor Solyman. In 1810, indeed, the Porte succeeded in supplanting the reigning pacha by a creature of its own, who, however, effected the expulsion of his rival only by collecting a band of hardy Kurd mountaineers, who form at present the ruling power in Bagdad. In general, after a year or two of possession, a game begins between the Porte and the new pacha; the latter endeavouring to shake off his dependence, while the former strives to terminate the refractory vassal's life by the bowstring; and notwithstanding the decayed and decrepit state of the sultan's power, yet, by incessant perseverance, and by throwing his weight in the scale of a rival candidate, it has usually succeeded in the end. An attempt, indeed, partly successful, is even now making by the Pacha of Egypt to wrest the whole of these territories from the Porte; but its final issue is not yet ascertained.

3704. *This imperfect and precarious independence* is, generally speaking, the reverse of an improvement in the condition of the unfortunate people. The pacha rules with as complete and tyrannical a sway as the sultan: he is rendered cruel by the dangers by which he is surrounded; and careless of the welfare of his district by the precarious tenure on which his place is held. In order to maintain his power, he takes into pay the brave but fierce and predatory inhabitants of the mountains, and must secure their attachment by allowing them liberty to commit plunder and outrage. According to Volney, they raise a prosecution in one place against a rich man, and strip him under a specious pretext; in another, they hire false witnesses, and impose a contribution for an imaginary fault; they foment every where the enmities of sects, and encourage them to give informations against each other, in order to afford a pretext for *avanies*. Thus their imprudent avarice collects into one heap all the riches of a country. When the government pretends to avenge the oppressed people, it snatches to itself the spoil from the hands of the oppressor, and sheds his blood uselessly, for a crime of which itself is the accomplice, and by which it profits.

SECT. V. *Productive Industry.*

3705. *The causes which have rendered abortive the vast capacities* given by nature to this region for the production of almost every species of wealth, have been sufficiently explained in the preceding section. It is true that all these countries have, from the earliest ages, been distinguished rather by agricultural industry, and the rearing of cattle, than by the finer manufactures, which they have been accustomed to receive by caravans from the great empires of the East. In most of its districts, however, culture is rendered insecure by the oppression of the pachas, and the ravages of the Arabs, against which the government cannot, or at least does not, afford protection. Hence, in many parts, particularly in the tracts

behind Jordan and Lebanon, and in Mesopotamia, which were formerly covered with the richest harvests, no trace of fertility remains, except only in their overgrown and deserted pastures. The upper tracts of Asia Minor and Armenia, where horses and cattle are reared, are both less exposed to inroad, and better able to defend themselves, though they too often abuse their strength to plunder the inhabitants of the neighbouring plains. Here, however, is produced the fine goat's hair or mohair of Angora, which is sought in Europe as a material of some valuable manufactures.

3706. *The manufactures of Asiatic Turkey* are chiefly of an ordinary kind, coarse, and for internal consumption only. Yet silk, cotton, leather, and soap are staples of the Levant; and the two latter find a place in the markets of Europe. Finer specimens, however, of all these commodities seem to be afforded from the cities of Barbary. The manufacture of Damascus blades, so famed in the middle ages, ceased from the period when Timur carried to Tartary the artisans employed on them. At Tokat there is a great fabric of copper vessels. The women among the wandering tribes in the upper districts weave the admired Turkey carpets; but the finest are made in the mountain districts of Persia.

3707. *No part of the world* appears more expressly destined to be the seat of an extensive commerce. The command of the Mediterranean, the numerous coasts and islands by which it is surrounded, its position at the connecting point of the three continents, and its contiguity to countries whose dissimilar tastes and productions peculiarly fit them to supply each other's deficiencies, are advantages which naturally rendered it the earliest and most favoured seat of commerce. The splendour of its ancient emporia excited the astonishment of the world; and they continued for a lengthened period, notwithstanding the hostile influence of revolution and oppression, to preserve a considerable portion of their early commerce and magnificence. These, however, have at length almost totally disappeared. Only Aleppo and Smyrna survive; the former supported by Syria and the caravan trade of interior Asia, by which at one time it received even the muslins and jewels of India. Since the discovery, however, of the passage by the Cape of Good Hope, the Indian trade has taken almost wholly a different route. The internal distractions which agitated Persia for half a century rendered the intercourse with that empire both dangerous and unprofitable. Through these causes Aleppo, once the chief seat of commerce in the Levant, has suffered a great decline. Smyrna, as it carries on merely the local commerce of Asia Minor, the part of the empire which has suffered least by anarchy and rapine, still maintains a respectable place as a trading city. It exports raw silk, goat's hair, Turkey carpets, raisins, drugs, and gums, in exchange for the cloths and hardware of Europe. (There is a very full account of the trade of Smyrna in M'Culloch's *Commercial Dictionary*, under the head SMYRNA.)

SECT. VI. *Civil and Social State.*

3708. *The state of social existence*, religion, learning, and manners, so far as respects the ruling people, is precisely the same in Asiatic as in European Turkey. They present that austere, uniform, and gloomy character, which the precepts of Mahomet tend to form, and which is produced in its utmost purity in the cities of Turkey. The native and subject races, however, exhibit marked distinctions. The Greek population, which in Europe makes the prominent feature among the conquered people, exists only to a limited extent on the coasts and islands of Asia Minor. In its room all the mountainous Asiatic tracts contain bold and hardy tribes, who, availing themselves of their distance and the declining power of the pachas, admit little control over their internal proceedings, and establish independent and sometimes almost republican governments.

3709. *The high and uncultivated table-lands* in the interior of Asia Minor are occupied by a wandering and pastoral race called Turcomans, either because they are really descended from the people of that name on the east of the Caspian, or perhaps, because a similar situation, producing similar habits and aspect, has caused the two to be confounded. They drive their flocks in summer into the most elevated tracts, and, as winter approaches, lead them, down into the lower and sheltered valleys. All their habits are decidedly Tartar; and with the domestic simplicity of this race they combine its love of war and booty, with no nice consideration how this latter may be obtained. When summoned, however, to fight under the banner of the empire, and to unsheath the sword against the infidels, they are prompt in obeying the call, and form the main military strength of Turkey. They serve a short campaign without pay, but with little ardour, and with full licence of plunder. Though they cannot meet disciplined troops in the shock of battle, they make excellent irregular cavalry.

3710. *Syria, Palestine, and Bagdad* have attracted great numbers of *Arabs* from the vast deserts by which these countries are bordered. Besides those who make inroads for the sake of plunder, or who drive their flocks, with or without permission, into these more fertile pastures, there are many who have obtained a fixed settlement in the fields or the cities, and have become regular subjects of the empire. These conform to established manners, and have a more gay and polished address than the Turks. Many of them become

thriving merchants; but they never forget those long genealogies, that respect for the beard, and admiration for the horse, which form the pride of the Arab in his native desert.

3711. *The steep and rugged heights of Lebanon* have given shelter to races of quite a different character from the wandering or the settled Arabs. Those high slopes, unfit for pasturage, are made, by the laborious culture of the people, to yield them subsistence; they fight on foot with the musket; they have, what is most rare in Asia, national assemblies, with some form of republican government. Among these mountain tribes, the chief are the Maronites and the Druses.

3712. *The Maronites* were originally the proselytes of Maron, a saint of the fifth century; but being stigmatised as heretics, they, in the seventh century, sought refuge, under a distinguished leader called John the Maronite, in the hilly country of Kesrouan, behind Tripoli. Here, when the Saracens over-ran Syria, carrying on a war of fierce persecution against the Christian name, the Maronite territory became the retreat of many who were willing to sacrifice all for the free exercise of that religion. Having procured arms, they bravely defended themselves, and the Mahometans were unwilling to waste their time and resources on a territory so difficult and so poor. By degrees they not only freed themselves from subjection of every kind, but, availing themselves of favourable occasions, made inroads into the surrounding territories, and carried their arms even as far as Jerusalem. At length Amurath III., a fierce and active prince, became indignant at seeing his power thus braved. In 1588, he collected a large force, penetrated into their territory, and compelled them to acknowledge the supremacy of the Porte, and to bind themselves to the payment of an annual tribute, which has ever since been paid, or at least owned as due. In every other respect, they endure scarcely any control. The catholic rites are celebrated as publicly in Kesrouan as in Italy. Of the numerous villages built on the sides of the hills, each has its priest, its chapel, and its bell. The Maronites, notwithstanding their deviations from strict orthodoxy, have been received into the communion of the church of Rome, which nothing could ever induce them to renounce, and which connives at their retaining a patriarch of their own, who resides at the monastery of Kanobin. Kesrouan contains upwards of 200 convents; but as the monks till the ground, and have brethren capable of carrying on all necessary handicraft trades, they cannot be ranked as useless members of society. The numerous priests are supported solely by the bounty of their flocks, which they are obliged to eke out by the cultivation of land, or the prosecution of a trade; even the bishops do not usually enjoy a revenue of more than sixty guineas a year. For this poverty, the clergy are compensated by the great respect paid them by the people, who kiss their hands whenever they meet them. The Maronites, in general, live in a happy simplicity, in rude hamlets or solitary houses, among the acclivities of Lebanon. They recognise no distinctions of rank. Those indeed, whom they call *sheiks*, or, as we would say, little gentry, have a few advantages of dress and food, but live in the most frugal manner; while very few are in want of the absolute necessities of life. They have scarcely any form of government; the villages forming so many little communities, secured by simple and peaceful habits from those evils which, elsewhere, the sword of justice must remedy. When, however, any outrage is committed, they unfortunately assert and exercise the Arab right of private vengeance. The Maronites are all armed, and, when their strength is called out, can muster 35,000 men, on which Volney calculates the entire population at 115,000: we should rather suppose it 150,000.

3713. *The Druses*, who occupy the more northern and still loftier heights of Lebanon, are a people of much rougher aspect, and all the religion they have is of the Mahometan species. The notions that they derive their origin from the crusaders, and their name from the Count de Dreuse, are now completely exploded. Their creed is traced to Hakim, one of the Fatimite caliphs of Egypt, who, in the tenth century, commenced a radical reform of the Mahometan religion. In this career, he cut off at once all its peculiarities; the prohibition against eating pork and drinking wine, the pilgrimage to Mecca, the observance of fasting, and the recital of the five prayers. Unfortunately he extended this latitude to essential points of moral duty, permitting even incestuous marriages, and finally erecting a worse superstition than that which he had overthrown, by setting himself forth as an incarnation of the Deity. He finally fell a victim to the enraged multitude, whose opinions he trampled upon; but his dogmas, and even his wildest personal pretensions, spread throughout Syria. They were proscribed, however, as monstrous and heretical by the prevailing part of the Mahometan world; and their adherents, like the Maronites, were obliged to flee into the recesses of Lebanon. Being reinforced by other heretical sectaries, they proved extremely formidable, till Amurath III., in the same expedition in which he reduced the Maronites, compelled the Druses also to bind themselves to the payment of an annual tribute. He stipulated, moreover, that, instead of living in a species of anarchy under their sheiks, they should choose, subject to the approbation of the Porte, a prince or *emir*, who should be responsible for their peaceable deportment, and the regular payment of the tribute. This arrangement, however, had a result opposite to what was contemplated. It gave to the nation an union before unknown; the consequence of which appeared very obvious,

when Fakr-el-din, or Facardin, founded a sort of kingdom of the Druses. Having taken Bairout, he made it the capital, and such it has ever since continued. Having been induced, however, to visit Italy, he contracted voluptuous habits, unsuited to Oriental ideas, which weakened his influence, and led, finally, to his captivity and death. The Druses, however, continued to be ruled by his family, till it became extinct, when another was established in its place.

3714. *The Druses derive from their independence* an energy and a vigour of character unknown to the other nations of Syria. A considerable part of the land is in the possession of a few great sheiks, whose factions often embroil the natives, but at the same time maintain a spirit of liberty and activity. All the great affairs of the nation must be decided in an assembly of these sheiks, at which even peasants are allowed to be present, and to give their voice; so that this government presents a mixture of powers somewhat similar to that existing in the British constitution; but it wants the fixed laws and established order which secure the latter against anarchy. The Druses are prompt in flying to arms. As soon as a hostile resolution is formed by the assembly of the nation, the criers, from the tops of the mountains, sound "To war! to war!" at which signal 15,000 Druses speedily muster. They have no bayonets, are strangers to tactics or discipline, and are merely a crowd of peasants with short coats and naked legs; brave almost to excess, and entertaining a proverbial contempt of death. They never encounter an enemy face to face in the open plain. They are a sort of rude chasseurs, firing behind rocks and bushes with such accuracy as seldom to miss their aim. Thus, when met on their mountain ground, they are nearly invincible. In regard to religion, although by no means wholly devoid of it, as their enemies allege, they show a singular absence of that ostentatious and sectarian zeal which pervades the Oriental world. They pray indiscriminately in a church or in a mosque, and appear to view Christianity with less aversion than Mahometanism. Any strict outward observance is chiefly confined to an initiated class, called *okkals*, or doctors, who consider themselves as alone holy and learned among an ignorant people. Europeans, after long and vain attempts, have at length obtained a sight of their sacred books, but without being much the wiser. Amid an obscure mystical jargon, it only appears that Hakim is still regarded with the same boundless veneration, and that his pretensions to a divine origin are fully admitted. In practice they adhere to his rejection of circumcision, fasting, and all the characteristic Moslem observances; they even admit his permission of incestuous connection, to the extent of marriage between brother and sister. They have the virtues and the vices of barbarous life; the same boundless hospitality, the same deadly feuds, as among the Arabs. A general levy of the nation produces 40,000 fighting men, from which we may probably estimate the entire population at 200,000; a number which, on this small and poor district, denotes a superior density to that of the plains beneath, and fully illustrates the beneficial effects of liberty, even in this rude form.

3715. *Heresy in Lebanon* has given birth to other national distinctions. In a part of its most elevated interior, towards the south, dwell the *Motoualis*, a race of the most bigoted Mahometans, but who adopt the sect of Ali, which prevails also throughout Persia. They are therefore designated by the Turks as *shiites*, or heretics, while they call themselves by a name which expresses the fullest confidence in its truth. This deadly schism, which has caused so much blood to flow in the Moslem world, has rendered the Motoualis hated by all their neighbours, Christian and Mahometan. They will not even drink out of a vessel which has been used by either of these sects, till it has undergone a purification. At holy seasons they are said to study to wash away their sins by shedding the blood of a heretic. They fight with such intrepidity, and even desperation, that, though not mustering above 7000 fighting men, they have remained always unconquered, and this handful has put to flight armies of many thousands. The *Ansarians* dwell along a range of northern heights towards Antioch. They live in a sort of anarchy both as to religion and government; but they are very little known. It would be improper to conclude without mentioning the *Latins* or *Franks*, who are almost all monks, and act the part of *ciceroni* to strangers in the Holy Land; but, as their character is essentially European, and only modified by local circumstances, their peculiarities will be better distinguished when we come to treat of Jerusalem and its vicinity.

3716. *The mountains of the eastern frontier of Turkey* produce races exhibiting decided peculiarities. The great and ancient kingdom of Armenia, situated in a mountainous corner of Western Asia, has remained comparatively little affected by that mighty train of revolution which has swept over that region. Here, too, religious schism has given its stamp to the character of the natives. In the famous controversy of the two natures, the Armenians followed the dogma of Eutyches, who admitted in the Saviour only one, compounded of divine and human. The character of the Armenians, however, has been formed, not so much by a dogma transcending human comprehension, as by habits of religious quietude and political exclusion. Their course of life much resembles that of the Jews, with whom they are often found in conjunction. But what in the latter is sordid and grasping parsimony, appears scarcely in the Armenian to exceed the limits of steady and meritorious industry. This people, in fact, carry on all the trade, and many of the manufactures, of Persia and Turkey. Ispahan, in the days of its greatness, had Julfa, a large suburb, expressly appropriated to the Armenians. They have penetrated into India, central Asia, Africa, and the east of Europe; and have been sometimes, though not often, seen in France and England. In general they lead a peaceable and orderly life, under the government of heads of families. The court of Rome, by indefatigable efforts at conversion, has succeeded in effecting a species of schism, by drawing over to her communion 20,000 out of the 170,000 families of whom the nation consists. The great remaining majority adhere to the Eutychian creed, and revere, as their head, the patriarch of Erzeroum. They admit the marriage of priests, and are free from other catholic superstitions; but in return they carry fasting and ablution to a pitch unknown to any other Christian sect.

3717. *The Koords, or Kurds*, inhabit a long and rugged chain stretching south-east from the mountains of Armenia, parallel to the Tigris, along the frontier of the Turkish and Persian empires. They are the same people known under the ancient name of Carduchi, through whom Xenophon so hardly fought his way, when conducting the famous retreat of the Ten Thousand. They have still the same name, and are the same people; the boldest and rudest in all Asia. Those pastoral pursuits which, on the high table plains of Tartary and Persia, vary and soften the habits of war and plunder, are impracticable in a region which presents nothing but rugged steeps, frightful ravines, and narrow valleys. Here every chief is seated in his castle, where he meditates, and whence he attempts, the plunder of the rich plains which lie beneath him. The Koords have, however, the characteristic virtue of barbarians, a frank hospitality, and also a pride of pedigree, founded on a national existence which may be traced to a high antiquity.

SECT. VII. *Local Geography.*

3718. *The deep interests which attach to this region of Asia* depend little on the divisions established by the Turkish government. It calls them pachalics, from each being governed by one of its modern satraps. This circumstance often very seriously affects, for a time, the destiny of the people; but it does not, to European eyes, form any permanent or distinctive features. We know these territories, not under the name of the pachalics of Acre, of Tripoli, of Istchil; but under others, which refer to the memory of their departed glories, and to what they were when they presented to the eyes of mankind the Holy Land, Troy, Tyre, Syria, and Babylon. We seek on these shores exclusively the monuments and traces of the period when they bore these immortal names; and we gaze on the modern inhabitants and their abodes, chiefly in wonder at the sad and surprising contrast which they exhibit.

3719. *In surveying, on this principle, the Turkish Asiatic empire*, we shall divide it into four parts:—Palestine, or the Holy Land; Syria; Asia Minor; provinces on the Euphrates.

SUBJECT. 1. *Palestine.*

3720. *Palestine*, a name supposed to be derived from the ancient Philistine coast, has been applied, from the earliest of modern ages, to the territory anciently assigned as the portion of the twelve tribes. The dimensions of this country do not correspond to its fame: it may be 150 miles in length north and south, and nearly as much in extreme breadth. It is bounded on the west by the Mediterranean; on the north it ranges along the southern skirts of Libanus; while, on the east and south, it passes into the Arabian desert, amid long ranges of rocky hills. Judea is a high country, rising by successive terraces from a shore that is, in many places, bold and lofty. Its principal eminences, Carmel, Bashan, Tabor, do not ascend into bleak and rugged heights: they are covered with villages, rich pastures, and luxuriant woods; on their slopes are copious vineyards, and in the clefts of the rocks numerous bees, feeding on their aromatic plants, deposit their honey. Traces are even found of a cultivation, by artificial terraces, equal to that which prevails in the most improved parts of the East. There has been here, however, a busier work of rapine and oppression than even in any other part of this suffering empire. Acre, under the sway of Daher, of Omar, and of Djezzar, scarcely paid even a nominal submission to the mandates of the Porte. The former was endowed with some great qualities; but Djezzar, ferocious and ignorant, having raised himself to power only by headlong determination and uncompromising cruelty, converted all the countries over which he tyrannised into little better than deserts. A line, however, drawn from north to south through Judea, attaches a large part of it to the pachalic of Damascus, which has long been, perhaps, the very best governed part of the Turkish empire. Within these limits, reaching from the sea of Galilee through Napolose, to the vicinity of Jerusalem, the region displays much of its ancient fertility. The declivities of the mountains are even formed into terraces, that they may retain the moisture, and be fit for bearing ample crops. This part of Palestine, however, and still more the other, is cruelly infested by bands of Arabs, who not only carry on habitual

incursions, but have regularly established themselves on the line of the principal high roads, where they cause every traveller deeply to rue his temerity if he proceed without the security of a strong armed body, or without having propitiated by liberal gifts the favour of some great thief of the desert. In such a vicinity, the husbandman, of course, reaps his harvest in little or no security; and Judea, on the whole, groans under the double evil of being at once ill governed, and not governed, or at least defended, at all.

3721. *Entering Judea from the south*, after passing the confines of the desert, we come first to Gaza, called by the Arabs *Razza* (with a strong guttural sound on the *r*). This celebrated capital of the Philistines still derives some importance from its situation, which renders it a connecting point between Palestine, Syria, and Arabia. The surrounding country, a wide flat expanse, covered with date trees, is more than half Arabian; but the immediate vicinage consists of a black and fertile soil, the produce of whose gardens is valued even at Constantinople. Gaza has about 500 looms, which manufacture coarse cottons for the neighbouring Arabs. They collect from them the strong alkaline plants which grow in the saline and sandy soil, and from which a soap of superior quality is manufactured. Its main dependence, however, is upon the caravans to Sinai, Egypt, and Mecca, which, entering here upon a long route where no provision can be found, must lay in at Gaza a large stock of every necessary. Occasionally there occur good opportunities of making large profits, when the Arabs bring to Gaza the proceeds of such of the great caravans as they have succeeded in plundering. These rude bandits then often present the most precious commodities of the East, without being able to form the least idea of their nature or value. Volney mentions one who had procured a collection of the finest pearls, which, viewing them as a vegetable substance, he endeavoured to boil; but finding no appearance of their becoming fit for food, he gladly disposed of them for a trifle.

3722. *Coasting to the north*, along a rocky coral shore, where navigation is attended with some danger, we come to *Joppa*, now called *Jaffa*, so conspicuous as the port of Judea, and the only point of communication which David and Solomon had with the Mediterranean. At present, the port is one of the worst on that sea, being so encumbered with rocks and shoals that vessels can anchor only at the distance of a mile from the shore. There is, however, an ancient harbour, now choked up, but which might be made to contain ships of 300 tons. Great antiquity is ascribed to Joppa even by the heathen writers. In the middle ages it rose into fame, from being chosen, as the nearest point to Jerusalem, for the landing-place of the great crusade under Richard Cœur de Lion and Philip of France. Jaffa continued the head-quarters of the Christians in that celebrated campaign; and to the south extends the wide field of Ascalon, where the arms of the Crescent sustained so signal an overthrow. In the history of the present day, Jaffa has obtained a dismal celebrity from its capture by Bonaparte, and the subsequent massacre of the prisoners captured there. Jaffa is now a collection of poor huts built round the amphitheatre of a hill, with no military strength, though, from its situation, and two fine springs within its walls, it might be converted into a very strong fortress. At Jaffa is a convent of the monks of the Holy Land, a plain wooden building close to the sea, where Christian travellers and pilgrims meet a hospitable reception; but the fathers themselves live under continual apprehension for the safety of their property, and even their lives, from the bigoted enmity of the savage race to whose absolute sway they are subjected.

3723. *As soon as the pilgrim has secured a convoy*, he hastens towards the mountainous region before him, in the centre of which is Jerusalem, the main object of his expedition. He sees the vicinity stripped by the passage of hostile armies, at various periods, of the trees which once adorned it; but there are still a number of well-watered gardens, enabling Jaffa to make a considerable export of fruits, among which the water-melons appeared to Clarke the finest he had ever seen. The Vale of Sharon, which next presents itself, is still remarkable for its rose, celebrated in Hebrew poetry. After passing a number of villages, mostly in ruins, at the foot of the dark hills which ascend towards the rugged centre of Judea, we enter Rama or Ramla, the ancient Arimathea. No part of the Holy Land is more fertile than the plain round Rama, which resembles a perpetual garden. The Christian army found it a fenced city; strong, populous, and abounding with all the luxuries of the East. It is now only a collection of plaster huts, interspersed with olives, figs, and *nopals*, and overshadowed by fine palm trees. Three miles to the north of Ramla is Lydda, now Loudd, a place of some fame in scripture history, but much decayed, though a weekly market is held for the cotton spun by the neighbouring peasantry.

3724. *From Ramla we ascend at once to the hill country of Judea*, a dreary and gloomy region, the aspect of which appeared fully to explain to Chateaubriand why Jephtha's daughter and the prophets of sorrow repaired thither to pour forth their lamentations. To Dr. Clarke they appeared to resemble the rudest parts of the Apennines; the sides of the mountains consisting chiefly of naked limestone precipices towering like walls, and the strata of which resembled the seats of an amphitheatre. From their crevices grew dwarf oak, box, and rose-laurel; and considerable woods of olive trees in some places extend along their sides. Bands of Arabs have every where formed fixed stations in these rocky fastnesses, and render this the most dangerous part of the journey through the Holy Land. Between these hills, however, occur well-watered valleys, which produce plentiful crops both of grain and fruit. Some fine villages are embosomed in their recesses. At St. Jeremiah (named in memory of the prophet), Chateaubriand saw goats with pendent ears, sheep with large tails, and asses that, by their beauty, reminded him of the onagra of Scripture. In what is called the Terebinthine Vale may still be traced the scene of the great combat between Israel and the Philistines; the brook in which David collected the stones, with one of which he laid in the dust the gigantic boaster who had struck terror into the Jewish army.

3725. *After passing through about thirty miles of such territory*, the exclamation is made *El Kods!* (the holy city!) and the traveller sees Jerusalem (*fig. 551.*). Its aspect seems to

551

JERUSALEM.

3 L 4

have struck travellers variously. Chateaubriand describes it as a line of Gothic walls flanked by square towers, with the tops of a few buildings peeping above them. Dr. Clarke, on the contrary, who approached, indeed, from the north, says: — “Instead of a wretched and ruined town, described by some as the desolated remnant of Jerusalem, we beheld, as it were, a flourishing and stately metropolis; presenting a magnificent assemblage of domes, towers, palaces, churches, and monasteries, all of which, glittering in the sun’s rays, shine with inconceivable splendour.” It is probable that the difference of the aspect, and of the objects presented at the opposite sides of the city, may account for pictures so much at variance.

3726. *Jerusalem*, in its greatest extent, stood upon four hills, some of which might almost be termed mountains, were it not for the loftier elevations with which it was encircled. Mount Sion was the upper or principal quarter, — the Mount of God, the city of David, — on which were situated the finest edifices and strongest fortifications. To the east was Mount Acra, to the east and west Moriah, and to the north Bezetha. From the last, a broad and fine valley stretched towards the ancient Samaria. On the other side the deep valleys of Jehosaphat, Hinnom, and Siloe penetrated to the awful rocks which stretch towards the Dead Sea. These valleys are still watered by the brook Kedron and the pool of Siloam; and the rocky sides of the hills immediately bordering on them have been excavated into tombs; but they have never been built upon, and the inhabited part of the city has been always upon the summits and along the sides of the hills. The walls were formerly four miles in circuit, but this is now reduced to two and a half; and a part of what is commonly supposed to be Mount Sion is now covered only with ruins. Of the remaining circuit, a great part presents little more than the remains of a city. The gloomy desolation which pervades it is described by Chateaubriand as extreme. “The houses are heavy square masses, very low, without chimneys or windows. They have flat terraces or domes on the top, and look like prisons or sepulchres. The whole would appear to the eye one uninterrupted level, did not the steeples of the churches, the minarets of the mosques, and the clumps of nopals, break the uniformity of the plan. Enter the city, you will there find nothing to compensate for the dulness of its exterior. You lose yourself among narrow unpaved streets, here going up-hill, then down, from the inequality of the ground, and you walk among clouds of dust or loose stones. Canvass stretched from house to house increases the gloom of this labyrinth; bazaars roofed over, and fraught with infection, completely exclude the light from the desolate city. A few paltry shops expose nothing but wretchedness to view, and even these are frequently shut, from apprehension of the passage of a *cadi*. Not a creature is to be seen in the streets, not a creature at the gates, except now and then a peasant gliding through the gloom, concealing under his garments the fruits of his labour, lest he should be robbed of his hard earnings by the rapacious soldier. The only noise heard from time to time in this desolate city is the galloping of the steed of the desert; it is the janissary who brings the head of the Bedouin, or returns from plundering the unhappy fellah.”

3727. *Two splendid objects shine conspicuous* amid this gloomy picture, which is probably, however, a good deal overcharged, and place Jerusalem on a level with whatever is most splendid in the East. These are, the Church of the Sepulchre (*fig. 552.*), and the mosque

552

CHURCH OF THE HOLY SEPULCHRE.

of Omar. The former has long been the grand object of pilgrimage and visitation to the Christian world. It was erected by the empress Helena, the mother of Constantine, upon a site which was supposed to include the scene of all the great mysteries of our religion, — the crucifixion, the entombment, the resurrection. It consists properly of three churches or chapels, connected together by walls and covered passages. The first and most extensive is termed the Church of the Holy Sepulchre. The rock, however, in which the tomb was excavated is allowed to have been almost entirely cut away, and that part which contains the sepulchre now rises above

the ground in the form of a grotto covered with slabs of beautiful *verde antico*, rendered rough by the numberless fragments furtively broken off by crowds of devout pilgrims in search of holy relics. Close to the entrance is a block of white marble shown as the stone on which the angel sat, and in the interior lamps are continually burning. The two other churches consist of large apartments, one above, the other below. The lowest is called the Church of the Three Crosses, which were supposed to have been there miraculously discovered: it contains also the tombs of Godfrey and Baldwin, the Latin kings of Jerusalem; and a rent is shown in the natural rock, supposed to be that produced by

the earthquake at the crucifixion. The upper church is called that of Mount Calvary, where the rock again appears with the same rent, and with holes supposed to indicate the place of the Three Crosses.

3728. *Small apartments along the sides of the walls of these churches*, both within and without, are occupied by monks belonging to the different nations of the East and West; Latins, Greeks, Abyssinians, Copts, Armenians, Maronites, &c. According to Maundrell, the possession of these sacred places was often furiously contested. From abuse and vituperation, the combatants proceeded to wounds and blows; and the sacred floor was not unfrequently stained with their blood. The guide showed to the above-mentioned traveller, scars, which he had himself received in these unholy contests. In 1690, however, the French king is said to have secured for the Latins the exclusive command of these sacred places, the occupation of which is now distributed by them at will among the other sects. The monks are continually engaged either in keeping 200 lamps constantly burning, in preserving every spot in these churches strictly clean, or in celebrating the mysteries of their worship. "From the arches above, where they nestle like pigeons, from the chapels below, and subterraneous vaults, their songs are heard at all hours both of the day and night. The organ of the Latin monks, the cymbals of the Abyssinian, the voice of the Greek caloyer, the prayer of the solitary Armenian, the plaintive accents of the Coptic friar, alternately or all at once assail your ears; you know not whence these concerts proceed; you inhale the perfume of incense without perceiving the hand that burns it; you merely perceive the pontiff who is going to celebrate the most awful of mysteries on the very spot where they were accomplished."

3729. *It is remarkable that, after the precincts of this temple* have been so long venerated as containing the scene of all the mysteries of the Passion, a late great traveller has openly disputed, and even derided, the whole of the locality. Dr. Clarke insists that there is no hill such as could be Mount Calvary, and no space on which the crucifixion could take place; that the alleged sepulchre is not cut out in the rock, but is composed of a number of detached pieces of stone cemented together; that the stone does not fit it: in short, that it ought to be without the city, and by no means in its present position. He finds a much more probable site among a number of tombs, which he discovered in the valley of Hinnom, and some of which are spacious and handsome. We have not time or means to enquire what room there may be for this scepticism, and whether it is worth while to disturb a belief to which religious feeling has attached itself during so many ages. In general, we may observe, that the sepulchral monuments of Jerusalem, particularly the tombs of the kings, of the Virgin, and of the patriarchs, display no common share of labour and beauty. They are usually spacious chambers cut out of the solid rock, and elegantly ornamented with carving and sculpture.

3730. *By much the most splendid edifice in Jerusalem*, however, consists of the mosque erected by Omar on the site of the Temple of Solomon. It is an octagon surmounted by a lantern of the same shape, and is considered superior to any other structure in the Turkish empire, not excepting the mosque of St. Sophia at Constantinople: it yields only to the matchless boast of Saracenic art, the Alhambra. The walls are externally lined with painted tiles covered with arabesques, and with verses from the Koran in letters of gold. Its numerous arcades, its capacious dome, with the rich costume of Eastern devotees passing and repassing, render it, even from without, one of the grandest sights which the Mahometan world has to boast. The interior is in general rigorously shut against Christians; but Dr. Richardson contrived to effect an entrance. He found it a magnificent square 1489 by 995 feet, the floors and walls of marble, and the *sakhara*, or inner shrine, 60 feet square, of the finest materials, and covered with sentences from the Koran.

3731. *The manufactures of Jerusalem* consist chiefly of objects accounted sacred, and sold much above their real value. Among these are shells of mother of pearl, held as badges of pilgrimage, crosses, and beads made either of the stones of dates, of a species of hard wood, or of the black fetid limestone of the lake Asphaltites. These holy toys are largely purchased even by those who do not hold them in much account, but who know that they will form the most acceptable of all presents to the Greeks, and even to the Catholics. The Latin monks receive, lodge, and guide the pilgrims for a month, leaving it entirely optional with their guests whether they shall bestow a gratuity at parting. This, however, is usually done to the utmost of their ability; by which, with the remittances from Europe, Volney conceives that vast treasures must have been accumulated. Against this inference Chateaubriand urges, that the Latin pilgrims may be considered as nearly extinct, since not above 200 had been numbered in the course of a century; that the Oriental pilgrims do not exceed fifteen or twenty, often poor, and their purses drained by the exactions of the Turks and Arabs; that the monks themselves have often large sums extorted from them by the *avanies* or arbitrary demands of the government: in short, he does not think they can do more than support their establishment.

3732. *The highest and most desolate tracts of Judea* occur south-east from Jerusalem, and lead to Lake Asphaltites. The cultivated and smiling valleys of its lower stage appear no longer. The surface is broken only by deep and dreary glens, hemmed in by precipices so lofty as to exclude the sun; the chalky summits of the rocks, rent as by a convulsion, shoot into a thousand fantastic shapes. Their sides are perforated by deep caves, which served as a retreat to the saints and prophets of the Old Testament, and to the Christians of the middle ages. Every spot here recalls some of the great events of sacred history. "Extraordinary appearances every where proclaim a land teeming with miracles: the burning sun, the towering eagle, the barren fig tree; all the poetry, all the pictures of scripture, are here. Every name commemorates a mystery; every grot proclaims the future; every hill re-echoes the accents of a prophet. God himself has spoken in these regions: dried up rivers, riven rocks, half-open sepulchres, attest the prodigy: the desert still appears mute with terror, and you would imagine it had never presumed to interrupt the silence, since it had heard the awful voice of the Eternal." (Chateaubriand.)

3733. *The monastery of St. Saba*, rising perpendicularly from the ravine of the brook Kedron, appears in the heart of this desolate region. Once the refuge of the saints of the wilderness, it is now a scene of quiet monastic seclusion. In continual danger from the surrounding tribes of Arabs, it has less the aspect of a convent than of a fortress, the abode of some bold and ruthless crusader. Its immensely strong and lofty towers, frowning over hill and glen, are seen from a great distance; and one of the fathers, by turns, walks his nightly round on the top of the towers. Yet the Arabs, though continually hovering about in a menacing attitude, usually content themselves with levying a tithe of fine white bread, baked in the convent, and allow the convoys to pass unmolested. Somewhat to the south is Hebron, so venerable by its antiquity, and still a considerable Arab village. The court of Constantinople supports here a temple, built over the supposed sepulchres of the patriarchs, which are covered with magnificent carpets of green silk, embroidered with gold.

3734. These awful heights terminate in an object still more awful, *the expanse of the Dead Sea*. This lake, whose waves engulfed the guilty cities of the plain, presents, perhaps, the most dreary and dismal scene to be found in the circuit of the globe. The rocks by which it is enclosed present quite a different aspect on the eastern and on the western shores. On the former, which is that of Arabia or of Moab, a prodigious black perpendicular wall, in

which there is not a summit or the smallest peak, and in which the least bird of heaven could not find a blade of grass, throws its perpendicular shadow over the waters. On the western or Judean side the limestone and sandy cliffs tower in varied and fantastic forms, suggesting often the idea of piles of armour, waving standards, and rows of tents. The gloomy sea which these rocks encircle has been clothed by fancy with awful and supernatural characters. A pestilential vapour, it has been said, rises continually from its waters; fish cannot live in, nor birds fly over them; iron will not sink in them; nor have they ever been navigated by ship or bark. Recent travellers, however, in the hasty glances which they have caught of this extraordinary scene, have dispelled all that is marvellous in these descriptions, though they have at the same time shown that there was some foundation for them. The water contains forty-one parts in the hundred of salt; a much greater proportion than that of the sea, and derived from entire rocks of this mineral continually dissolving on its southern shore. It is impregnated also with other mineral substances, particularly bitumen, which often rises from the bottom, and floats in large quantities on the surface. Thus it acquires a much greater weight than any other water, and is able to support bodies that would sink elsewhere. A fetid and perhaps pestilential air often exhales from water impregnated with sulphur, bitumen, and similar substances. Late travellers may have found a few shell-fish on the shore, or seen a few birds on the wing over the waves; but these form only exceptions to the general absence of animal life. That boats and vessels are never seen on it, can only be owing to the want of any motive for its navigation. Every thing around, in short, bears that dead, dreary, and fearful character that ought to mark a country struck by the malediction of Heaven.

3735. *The shores of the Dead Sea*, and the valley to the north of it, consist of an expanse of salt, dry mud, and moving sand. In proceeding through the plain, Chateaubriand discovered what at first appeared to be sand in motion. On drawing nearer, he beheld a yellow current, scarcely to be distinguished from the sands on its shores. It was deeply sunk below its banks, slowly creeping towards the pestilential lake by which it is engulfed. This was the Jordan. In its higher course, however, as it descends from the Lake of Tiberias, it is bordered by trees and shrubs, and its banks are often picturesque; and in spring, when "the swellings of Jordan" take place, the river fills its deep banks, and flows with rapidity. Its vicinity is dreadfully infested by Arabs; notwithstanding which, the visitants of Jerusalem make crowded pilgrimages, for the sake of bathing in its sacred waters.

3736. Between the Jordan and Jerusalem is *the wide, flat, plain of Jericho*, twenty miles in length and ten in breadth, walled in on all sides by the high mountains of Judea and Arabia. It is, for this reason, very hot, and in many places parched; but the skill of the ancients conducted through it, with such skill, all the waters on its circuit, as to render it the most luxuriant spot in Judea. Even in its present neglected state, it yields good crops of wheat and barley; also the balm, for which this country has always been famous, though not equally with Arabia; the palm and, the *zaccon*, seemingly the *myrobalanum* of the ancients, which yields an oil superior to that of the olive. In this plain, the city of Jericho, famous through so many ages, is recognised, with some doubt, in the village of Ribha, a collection of about fifty Bedouin tents, that present no vestige of a city. Mr. Buckingham, however, noticed some ruins, at the distance of three or four miles, that appear to mark more precisely the real site of Jericho.

3737. Before quitting Jerusalem, it may be advisable to make an excursion south-west to

553

CHURCH AT BETHLEHEM.

Bethlehem, which ranks high among the sacred places. Bethlehem is still a considerable village, containing, according to Volney, six hundred men capable of bearing arms. It is chiefly visited for the sake of the convent built by Helena over the manger of the nativity (*fig. 553.*). The identity of the spot, seeing it is admitted even by Dr. Clarke, we shall not dispute; but the taste which has paved this humble scene with white marble, supported it with Corinthian columns, and hung it with blue satin embroidered with silver, may well be questioned.

3738. *From Jerusalem, the road northwards to Samaria* is through a rugged and stony country, which the industry of the people has, however, so formed into terraces, and so covered with vine and fig trees, and even with millet, cotton, and tobacco, that Dr. Clarke ranks it in many parts as the Eden of the East. Its flourishing state is the result of the beneficent influence of a better government, that of the Pacha of Damascus, within whose domain it was included. Here the traveller passes Bethel, the scene of Jacob's dream, and a fine valley called Kane Leban, the Lebonah of Scripture. After a march of sixteen hours, he reaches Napolose, or Napolose, near the site of the ancient Samaria. This city is one of the most beautiful and flourishing of the Holy Land. It stands in a bold and fertile valley, surrounded by hills, and embosomed in stately groves and rich gardens. The inhabitants, about 10,000, are employed in manufacturing for the extensive country around: soap is the chief staple. Here may be seen, seemingly well authenticated, the tombs of Joseph and Eleazar, and of Joshua, cut in the living rock. A small remnant is found of the ancient Samaritans, adhering to their worship upon Mount Gerizim, to their sacrifice of the ram, and to their peculiar version of the Pentateuch.

3739. Before proceeding onward to the fine regions of Galilee, it will be necessary to descend towards *the coast*, and notice some prominent features which it presents. Almost in a line with Napolose occurred Caesarea, the magnificent capital of Herod, long the seat of Roman government, and where Paul made his eloquent appeals to Felix and Agrippa. During its glory, no city of Palestine, scarcely any of Syria, could vie with Caesarea. Its marble palaces, theatres, and temples, looking towards the sea, struck with astonishment the passing navigator. Its temple rivalled that of Jerusalem; and its games, celebrated every five years, attracted a concourse of all the nations of the East. Plundered by Baldwin in 1101, and subjected to various turns of war and fortune, it was gradually deserted; and its materials have been employed in the ornament of modern capitals. Only a few remnants of marble walls and some porphyry columns remain scattered over its site.

3740. Quitting the ruins of Cæsarea, we approach the heights of Carmel, which, after running for a considerable space north-west, terminate in a rocky promontory about 2000 feet high, projecting into the sea. It contains a considerable number of grottoes, once occupied as cells and chapels by the austere order bearing the appellation of Carmelites. A very few still remain, who lead a recluse life, and are venerated even by the Mahometans, who supply their wants. The mountain bears the traces of ancient aqueducts, and of plantations of vines and olives; and on the top are the ruins of a considerable monastery erected by Helena.

3741. On the opposite side of the bay, partly enclosed by Mount Carmel, is Acre, which now ranks first in political importance of any town in this neighbourhood. Though often considered as Syrian, its position within the domain of the ten tribes, and its modern relations, appear to attach it to Palestine. During the crusades, it exchanged its ancient obscure name of Acon for that of Ptolemais, celebrated as a scene of siege and contest, and for the repeated change of masters which it had to endure. These vicissitudes reduced it almost to a desolate state, till, in the seventeenth century, the celebrated Emir Facardin began to rebuild it. In later times it became the capital both of Daher Omar and of Djezzar Pacha; and this last tyrant, while he desolated the rest of his dominions, made it his pride to restore and embellish Acre. It became still more famous when the Turks, fighting behind a mere garden wall, but guided and seconded by Sir Sydney Smith and a few British seamen, set bounds to the hitherto irresistible career of Napoleon, and forced him to retreat to Egypt. Acre is now a considerable place, though its streets, like those of most Eastern towns, are narrow and dirty; yet Djezzar, by collecting all the remains of Cæsarea and other surrounding ruined cities, erected the most elegant mosque and the finest baths that exist in Syria. More useful works are those of a bazaar and of a fine fountain for the supply of water, which was much wanted. He was even induced, by motives the urgent policy of which was obvious, to extend to commerce some measure of that protection which was elsewhere withheld: still, even here it was severely cramped by the blind cupidity with which he imposed duties and monopolies. There is, however, a considerable export of corn and cotton, the produce of the flat and fertile plain by which Acre is surrounded. The port, though it has lost much of its former importance, in consequence of being partially choked up with sand, has been in a good measure restored, and is the best on any part of this coast.

3742. The route from Acre into the interior is across the delightful plain of Zabulon, which Dr. Clarke compares to the finest parts of the Crimea or of Kent. On the other side is Sephoury, anciently one of the principal towns of Palestine, and augmented by the Romans under the appellation of Diocæsarea. A great part of its church, one of the stateliest edifices in the Holy Land, still remains: it is adorned with some very curious ancient paintings. The place itself is reduced to a miserable village.

3743. Between Sephoury and Nazareth a hilly and stony tract intervenes. This last spot, distinguished by the early residence of the Saviour, was raised to considerable importance during the crusades, and, after falling into almost total decline, was rebuilt by Facardin, and enlarged by Daher Omar. It now contains 2000 or 3000 inhabitants, who were reduced to great poverty under Djezzar; but, since his death, have enjoyed some tranquillity. The convent is large, resembling a fortress, and almost forming a little town by itself. It contains fourteen inmates, usually with a good many visitants. Nazareth ranks second to Jerusalem among the holy places, and the scenes of all the events in the life of Joseph and of the Virgin are carefully pointed out. The church, composed of three naves, is very handsome, adorned with magnificent staircases, and two beautiful columns of oriental granite. The most venerated spot is the Grotto of the Annunciation, the descent to which is by a flight of marble steps. The natives believe that, when sick of the plague, they may, by rubbing themselves against the columns, assuredly obtain restoration of health. Hence its approaches are continually crowded by the sufferers under this distemper; a circumstance which renders it very unsafe for other visitants.

3744. East from Nazareth is Mount Tabor (fig. 554.), a grand natural feature, rendered doubly celebrated by the transfiguration, of which it has, perhaps erroneously, been supposed

MOUNT TABOR.

the theatre. It is a very fine hill, about four miles in circumference, but rising so gradually that it may be ascended on horseback. On the top is a circular plain, about a furlong in length, which appears to have been at one time surrounded by a wall, when it formed a strong fortification; and traces of this wall are reported to have been discovered by some modern travellers. From the summit the view is truly magnificent, extending over the richest and most picturesque tracts of Judea; the plains, the hills, and the sea of Galilee; the mount

of Gilboa to the south, a high narrow ridge, famous for the signal triumph of the Philistines; and to the west, towards Nazareth, the plain of Esdraelon, which has been described as a portion of the Holy Land gifted by nature beyond any other. Abandoned, however, to oppression and misrule, it is nowhere turned up by the plough; it forms one vast meadow of the richest pasture, sustaining only a few scattered herds, guarded by trembling shepherds. This plain was the scene of the defeat of Sisera by Barak; of that of Josiah by Pharaoh Necho, and of many great encampments formed by the crusaders or the defenders of Palestine. Near its northern extremity is the small neat village of Cana, celebrated for the miraculous conversion of water into wine. Both Dr. Clarke and Dr. Richardson here observed traces of the custom to which the scripture narrative alludes, of water being kept in large jars or pots made of the compact limestone of the district.

3745. After passing Mount Tabor, and the range of which it forms the loftiest pinnacle, we enter the fine region of Galilee, a varied and fertile scene, extending along the western shore of the Lake of Tiberias. This large sheet of water, traversed by the Jordan in its early course, presents a different aspect from the dreary sea, begirt with naked rocks, in which that stream terminates. Enclosed by fertile valleys, and by verdant hills sometimes wooded to their summits, it presents, on a greater scale, the beauties of the finest lakes of

England. It is seventeen or eighteen miles long, five or six broad; its waters clear and transparent, with the current of the Jordan visible through them. On its shores were once many prosperous and flourishing cities, of which few traces remain. The only one which retains any importance is Tiberias, a Roman city founded by Herod the tetrarch, in honour of the emperor whose name it bears. Herod made it a splendid city, where he received with festive pomp deputies from many of the Asiatic princes, and entertained them with naval games upon the lake. Tiberias afterwards became the seat of a rabbinical university, in which character its fame was so great, that, notwithstanding its recent and Roman origin, the Jews still account it one of their four holy cities; Saphet, Jerusalem, and Hebron being the other three. As it continues to be a received opinion, that unless suitable prayers were addressed twice a week in each of these cities, the world would return to chaos, a just ground is afforded to solicit the contributions of all the wealthy disciples of Moses to avert such a disaster. Tabaria thus retains a population of 4000, of whom a large proportion are Jews. The present city is modern and Turkish; and though its site and fortifications have externally a grand and imposing aspect, the interior is very poor, and a great part of it deserted. The old city, at a little distance south, is marked by many fragments of walls and columns, but without any definite feature, or any great building in an entire state. In this quarter are baths, which retain their ancient reputation. Being very hot, and strongly impregnated with mineral substances, they are found of great virtue in rheumatic and eruptive diseases. Remains of other great cities may be found along the western shore; but the precise positions of Capernaum, Chorazin, and Bethsaida remain a subject of controversy.

3746. *In ascending to the high regions of the Upper Jordan*, and turning somewhat to the westward, we find the town of Saffad or Saphat. It is not mentioned in Scripture, and occurs only in the apocryphal book of Tobit; nor is it till the time of the crusades that it begins to figure as a place of importance. Notwithstanding this comparatively late origin, the Jews, influenced by its being the seat of a famous university, and the burial-place of some of their most learned rabbins, attach to it a degree of sanctity sometimes exceeding that of Jerusalem itself. It has been supposed that, 150 years ago, it was inhabited by 12,000 Jews. It became also a principal seat of the power of Daher Omar, who founded there a Mahometan college. After his time it was much neglected, and Volney represents it as dwindled into an almost deserted hamlet. Burckhardt, however, found it containing 600 houses, built on several small hills, in a high and commanding situation.

3747. *Returning eastward to the banks of the Jordan*, the general level of the country is found continually rising. The river here forms a flat marshy lake, some miles in circumference, called at present Lake Houle, anciently Julias, or Samachonitis. This upper plain of the Jordan is here shut in to the north by a lofty branch of Lebanon, called Jebel Sheik, or the Prince Mountain, which may be considered as forming the boundary between Palestine and Syria. Near its foot is situated Panias, which Herod, after embellishing and enlarging it, called Cæsarea-Philippi. It has now resumed its original name, and is sunk into a small village, though situated in a fine elevated country, fertile in grain, profusely embellished with plants and wild flowers, and abounding in game. Considerable architectural remains distinguish the vicinity, though it is still difficult to trace the magnificent temple erected by Herod in honour of Augustus. Round Panias, several rivulets, descending from the declivities of Jebel Sheik, unite, and form the Jordan. To the east of all these countries is a territory less closely attached to Palestine; that of the Hauran, called anciently the country beyond Jordan, which insensibly partakes of the character of the Arabian Desert, and becomes identified with it. For a considerable space, however, being traversed by Mount Gilead, it continues to be well watered, and contains a great extent of ground well fitted either for culture or pasturage. At present it suffers severely from the ravages of the Arabs; but under the Roman sway it appears to have been prosperous and flourishing. Djerash (the ancient Gerasa), Amman (Philadelphia), Bosra, and other towns, display on a great scale the remains of temples, theatres, baths, triumphal arches, and other structures which usually adorned a classic city. The remains of Gerasa have even been compared to those of Palmyra.

SUBJECT. 2. Syria.

3748. *After passing the northern boundary of Palestine*, we enter Syria, a great kingdom, equally famed in history, and presenting nearly a continuation of the same natural features: on one side the Mediterranean coast extending north and west; the high mountain chains parallel to it; the fine intervening valleys; and the great desert boundary on the west. Syria cannot boast an equal breadth of level territory; it may be considered in this respect almost a pyramid, of which Judea is the base. The mountains, however, are on a grander scale. Lebanon (*fig. 555.*) towers to a height unrivalled by any of the southern chains;

555

HEIGHTS OF LEBANON.

its summit crowned with perpetual snows, its sides still presenting the remains of those majestic cedars with which they were anciently covered. The plains of Syria, though narrower, are richer, and have been more highly cultivated; and more striking contrasts have thus been produced between the extremes of civilised and savage existence. Her cities have always outshone those of the neighbouring countries; her capitals of Damascus

and Antioch have been the most brilliant; her marts of commerce, Tyre, Sidon, Aleppo, the most flourishing and wealthy of any in the west of Asia.

3749. *Notwithstanding the strong natural barriers of Syria*, she has always with difficulty maintained an independent political existence. The early kingdom of Damascus is best known to us by its wars with the kingdoms of Israel and Judah. Being more directly on the road from the Euphrates, it was absorbed earlier into the empires of Assyria and Babylon. Following its successive destinies, Syria, after the death of Alexander, attained, under one of the heirs of his divided empire, a separate though not a native government. The powerful and warlike monarchy of the Seleucidæ endured until, after some brilliant efforts and with some glory, it was absorbed in the wide-spread empire of Rome. Syria was reduced completely to the condition of a province; but it formed always the centre of the Roman power in Asia, and Antioch was considered the eastern capital of the empire. On the decay of Rome, Syria was early occupied by the Saracens; although, as subordinate to Palestine, immense efforts were made by the crusaders to wrest it out of their hands. Syria, however, never assumed any independent aspect, and at last fell wholly under the Mahometan dominion. For the last three centuries it has continued subject to the Turks, except when agitated by the turbulent ambition of some of the pachas. Real independence has been achieved only in a certain partial degree by some of the mountain tribes, alluded to as inhabiting the ruder recesses of Lebanon, and who there, even in the very bosom of despotism, secure by their valour the enjoyment of the realities as well as the forms of liberty.

3750. *Syria, divided through its whole length by Lebanon*, like a huge spine, is formed into two portions, entirely distinct; one bounded by the coast, the other by the desert. Both are narrow and fertile; they contain many great cities, both ancient and modern. Tyre and Antioch, in the maritime district, are pre-eminent among the former; while, in modern times, the interior cities of Damascus and Aleppo have preserved, or acquired, a superior importance. A grand feature is the Orontes, which, rising near the southern extremity of Syria, flows behind Lebanon through its whole length, until it turns its northern point, and passes by Antioch into the sea. Perhaps, however, it injures the fertility of interior Syria, by receiving and conveying away all the waters which flow westward from the mountain, and which might otherwise have spread out, and watered a considerable portion of the sandy desert.

3751. *We shall commence our local survey with the southern maritime frontier.* Here, proceeding from Acre, under which pachalic this part of Syria is still comprised, we come at once upon a name which revives the grandest recollections. The little fishing town of Sour, or Tsour, is all that remains of ancient Tyre (*fig. 556.*). Modern times have seen the dread sentence fulfilled, that the queen of nations should become a

556

TYRE.

able houses have been built for the offices of government; and some of the Maronites, Motoualis, and other inhabitants of the neighbouring mountains, have been induced to settle there, and to undertake some trade. For this, scope is afforded by the grain, tobacco, and dried figs which are grown in the flat and somewhat fertile district by which Tyre is surrounded. The grain is sent to the islands; the other articles find a market in Egypt. Even under this faint revival, however, Tyre presents no image that can recall the memory of its

ancient magnificence. Jolliffe heard the population estimated at 5000, with a doubt, however, which is strongly confirmed by Turner, who does not think it can contain above 200 houses, two thirds of which are inhabited by Motoualis. The harbour can now admit only boats. There are traces of city walls about a mile in circuit, but none of any edifices more ancient than Christian churches, one of which is of very large extent. A priest still resides here, bearing the pompous title of Archbishop of Tyre.

3752. *From Tyre we proceed northwards* by a very flat plain, which becomes continually narrower till we arrive at Sidon (*fig. 557.*), the sister city of Phœnicia, superior, it is said, in antiquity, yet second in greatness

557

SIDON.

and fame. Though there is nothing corresponding to its ancient name, it has never suffered so total a downfall. A considerable trade is still maintained by the export of silk, and also of cotton, the spinning of which employs a considerable number of inhabitants. Sidon forms the principal port by which is carried on the maritime commerce of Damascus, from across the mountains. The vast moles, of which the ancient harbour was composed, are now entirely destroyed, though some of those huge stones which filled their entire breadth, may still be seen lying on the shore. Saïde, like other Turkish towns, dirty and ill built, contains from 5000 to 7000 inhabitants.

3753. *Northwards from Saïde*, the level plain of Phœnicia ceases. Lebanon, here towering to its loftiest height, throws down its branches to the sea, between which only deep and narrow valleys intervene. This is the seat of the power of the *Druses*, that remarkable people, who have been already introduced to the notice of the reader. Their capital, or, at least, the residence of their prince or emir, is at *Dair-el-Kamar*, merely an extensive rough village, with from 15,000 to 18,000 inhabitants, and a large *serai* or palace, which has no pretensions to elegance. Their most important town is *Bairout*, the ancient Berytus, now almost wholly in their possession. The mountains here enclose a fine plain, covered with mulberry trees, on which is reared the finest silk in Syria. Its export, and that of cotton, cause some trade at Bairout, and support a population which Volney and Jolliffe estimate at 6000.

3754. *The next place of any importance is Esbele*, called by Europeans Gibe, or Djebail; names which recall at once the Byblos of the Greeks, and the Gebal, whose ancient inhabitants, according to Ezekiel, were the calkers of Tyre. This place was the chief seat of the worship of Adonis, whose beauty and tragical history gained for him so conspicuous a place in the classic mythology. About a mile from Esbele flows the Ibrim, the ancient Adonis, the periodical reddening of whose waters, "supposed with blood of Thammuz yearly wounded," gave occasion to a wild and fantastic Phœnician festival. The circuit of the walls, about a mile in extent, was traced by Pococke, as well as the remains of a beautiful church of the Corinthian order, which must have been built in the fourth or fifth century: Volney reckons 6000 inhabitants.

3755. Behind Djebail is the hilly district of *Kesrouan*, a lower and extended branch of Lebanon, on which the *Maronites* have formed their establishment. Considerably in the interior, and far up the ascent of Lebanon itself, is the monastery of *Kannobin*, the residence of their patriarch. It consists merely of a number of grottoes cut in the rock, the largest of which has been excavated into a tolerably handsome chapel. Beneath rolls a river between two very high ridges of pine-covered mountains; so that the scene is awful and romantic. The ascending road becomes continually more wild and rugged, with numerous cascades dashing down the rocks; yet a few villages still occur, delightfully situated, and surrounded with groves of olive and mulberry. At length the inhabited part of Lebanon is terminated by a Carmelite convent dedicated to St. Sergius, which, in summer, forms a cool and delightful retirement; but the rigours of winter compel the monks to remove to Tripoli.

3756. *Although, however, human habitations be passed, the wonders of the mountain are not yet exhausted*; for in a plain, enclosed by its highest summits, is found the small but precious remnant of the cedars of Lebanon. About fifteen large old trees alone survive of that mighty forest, which recalls so many sacred and poetical ideas. The trunks are ample, one of them measuring twenty-four feet in circumference; but they soon part into several limbs, which rise parallel to each other for some space, till they begin to extend horizontally. The foliage is wide-spreading, like that of the oak. The wood is fragrant and white, but not materially unlike common timber. The young cedars, which, with the old, form a grove of about a mile in circumference, appear to be quite of an inferior race, scarcely to be distinguished from the pines with which they are intermixed. Although the remnant be so small, yet Volney, in pronouncing the view to be wholly unworthy the fatigue of reaching it, appears rather insensible not only to the influence of associations, but to the magnificent scenery which the traveller discovers on this route. An ascent of three hours from the cedars brings him to the snow-covered pinnacle of Lebanon, whence he discovers all the varied aspect of its mountain regions; the rich plains at its feet, and the distant shores of the Mediterranean. Before reaching this point, however, vegetation has expired, with the exception of a few stunted cypresses, which lose their spiral form, and, throwing out their branches sidewise, have the appearance of small oaks.

3757. *From Djebail the road leads close along the sea*, here bordered by the rocks of the Kesrouan, which shoot up into forms the most varied and picturesque. Nothing is passed except a paltry village, called Batroun, or Patrone, and a finely situated convent of the Greek catholics, called Belmont. At length the route opens upon the plain of *Tripoli*, stretching far to the north, and one of the most extended and fertile in all Syria. At its entrance is found *Tripoli*, capital of the pachalic of the same name, which consists of this wide maritime plain, reaching nearly to the northern limit of Syria. A mountain chain, indeed, continued from Lebanon, still runs through the interior, parallel to the sea, but neither so broad nor so lofty. It is thinly inhabited by the Ansarians. The plain along the sea is broader there than in any part of Palestine or the ancient Phœnicia. This plain is well watered, covered with rich pasture, and with extensive groves of mulberry, orange, and other valuable trees. Notwithstanding these natural advantages, it has, we know not why, been neglected, having never contained a capital city, or been chosen as the central seat of any of the kingdoms established in Syria. Even the pachalic into which it was formed has of late, according to the alternations of power and influence, been merged into those of Acre and Damascus.

3758. *Tripoli* is supposed by Burckhardt to contain 15,000 inhabitants, about a third of whom are catholic Christians. It is one of the few Turkish towns which have any pretensions to neatness, the houses being in general tolerably built, and of good stone. It is said to have been originally founded by three successive colonies from Tyre, Sidon, and Aradus; whence the Greeks called it Tripoli, or three cities. Some of the lower branches of Lebanon approach, and enclose round it a triangular valley, covered with the finest gardens and fruit trees. The situation is thus not only beautiful, but happily formed to command the advantages of every climate. It is, however, unfortunately subject to fever, in consequence of inundations made for the purpose of improving the growth of the mulberry trees. Under the crusaders this city was governed, with the

title of *count*, by Bertrand, son of Raymond of Toulouse. Six large towers, which had been built for its defence, still remain; but no fine ancient edifices. The trade is considerable, and before the last war was chiefly in the hands of the French. Its exports consist of raw silk, soap, and some sponges which are collected on the sea-shore. The harbour is tolerable, and the marina, or port, inhabited by Greek sailors and shipwrights, forms a little town by itself.

3759. *About forty miles north of Tripoli is Tortosa*, or Tortousa, once a very strong city, showing still the remains of two walls half a mile in circumference, the inner of which is fifty feet high. It contains

ISLAND OF ROUAD.

also a beautiful church of the Corinthian order. Nearly opposite to Tortosa is the island of Rouad (*fig. 558.*), the ancient Aradus, the Arad of Scripture, whence Tyre is said to have drawn her mariners. It is a mere naked rock, in which the spring of water by which the inhabitants were anciently supplied can no longer be discovered; but its position protected it from the despotism of the princes on the continent, and drew to it a great number of inhabitants, to accommodate whom the houses were raised to a surprising height. Only a few strong masses of wall, and numerous cisterns cut in the rock, attest the former existence of this thriving commercial state.

3760. *In journeying to Latakia*, a few striking objects present themselves; such are the strong castle of *Merkab*, seated on a hill, and about half a mile in circumference; the village of *Banias*, which scarcely presents any traces of the ancient city of Balanea; *Jebilee*, the ancient Gabala, equally poor in ancient and modern times. Much greater importance belongs to Latakia itself, the ancient Laodicea, founded by Seleucus Nicanor, and the port of Antioch. Its trade consisted in exporting to Egypt the fine wines for which the district was celebrated. At present this, being a branch of commerce prohibited by the Mahometan religion, has been superseded by that of tobacco. The returns are made chiefly in rice. The port is now small, as the Turks have allowed it, in a great measure, to choke up; but it is still the most secure of any on the coast. It is said that twenty years ago, Latakia was a very flourishing place, containing 10,000 inhabitants, and that it had nearly supplanted Scanderoon as the port of Aleppo; but of late it has deeply felt the effects of that misgovernment which extends over all this quarter.

3761. We have now traced the maritime plain of Syria, till it touches on that of Antioch, which forms the northern extremity of the kingdom, and which we shall consider in combination with that of Aleppo. It is time to retrace our steps, and, beginning afresh at the south, to survey the great plain situated on the opposite side of Lebanon, and bordering immediately on the desert, which forms Eastern Syria.

3762. *But before reaching this second division*, a striking feature claims our attention. In crossing from Sidon to the plain of Damascus, the great mountain appears separated into two parallel portions, distinguished by the ancients as *Libanus* and *Anti-Libanus*. These enclose between them a broad valley, anciently called *Cœlosyria*, or the hollow Syria; by the moderns it is named the Valley of Bekaa. The reflection of the rocks and mountains renders it intensely hot; but it is extremely well watered, and yields abundantly either pasturage or grain, according to the industry of the occupants. Of late, Turkish oppression, and the inroads of the Arabs, have almost entirely annihilated the peaceful labours of the husbandman, and converted great tracts of this fine territory into a desert. This valley presents, however, one grand and important feature, the ruins of Baalbec.

3763. *Baalbec* is situated at the northern head of this great valley, near to where the two Lebanons, uniting together, close in above its termination. From a town of some importance, it has dwindled into a decayed village, containing not more than 1000 or 1200 inhabitants. But Baalbec is famous for a mass of classic ruins, which, those of Palmyra excepted, nothing in Asia can rival. At the very entrance of the town, lofty walls and rich columns indicate the site of an ancient temple. The principal gate, obstructed by stones and rubbish, enters into a court 180 feet in diameter, strewn with broken columns, mutilated capitals, and various fragments; around it is a row of ruined edifices which display all the ornaments of the richest architecture. At the end of this court, another gate introduces the spectator to the view of a still more extensive range of ruins. The court here is enclosed by chambers, seven of which may be reckoned in each of the principal wings. It is difficult to discover their use; but this does not diminish the admiration excited by the beauty of the pilasters, the richness of the entablature, the large foliage of the capitals, and the sculpture of wild plants with which they are ornamented. At the end of this court appears the grandest feature of the edifice: six lofty solitary columns, formerly the peristyle of the chief shrine, to which all the rest of this temple was only subordinate. The square marked out by their foundations is said to be 268 feet long, and 246 wide. The shafts of the columns are 58 feet high and 21 in circumference; their entire height 71 or 72 feet. The order is Corinthian, and the workmanship of the richest and most splendid description. To the left is a smaller temple, the walls of which, and the peristyle, composed of thirty-four columns, are still entire. After passing over trunks of columns, ruined walls, and other obstacles, the gate may be reached, and a view obtained of the interior, now roofless; but instead of the grand spectacle of a prostrate and adoring people, and of sacrifices offered by a multitude of priests, the light of heaven shows only a chaos of ruins covered with dust and weeds. Nature and barbarism have combined in demolishing this noble fabric. When Wood and Dawkins visited it in 1751, there were standing nine columns of the great temple: Volney found only six; and of the small temple they found twenty-eight, he only twenty. These have been partly overthrown by the earthquake of 1751, partly undermined by the inhabitants for the sake of the iron cramps, by which the several blocks composing the columns are so closely held together as not to leave room for the blade of a knife. Of these blocks, now lying on the ground, some are of enormous dimensions; three of 58, one of 69 feet long. The natives, astonished at the power by which these fragments have been transported, ascribe the origin of the edifice to genii acting under the orders of king Solomon. It is customary in these countries to refer every great work to that prince; and Volney, with some reason, derides the idea of his having erected a Corinthian temple; preferring on good grounds the tradition which refers the erection of this noble structure to the reign of Antoninus Pius. Dr. Richardson, however, conceived that he clearly discovered, under the Grecian orders, a trace of Jewish foundations; in which case Baalbec would form a very natural position for the "house of the forest of Lebanon," on which Solomon bestowed so much cost and care; and, when accident and time had demolished it, the new edifice might have been built upon its site.

3764. After traversing all the branches of Lebanon to the eastern border of Syria, we arrive at the noble plain of Damascus. The environs of this city rank as the paradise of the East. Ranges of hills, branching off from the high chains of Lebanon, enclose it, and pour down

numerous waters, which unite in forming the boasted Abana and Pharpar of the ancients. These waters, indeed, cannot penetrate beyond the desert boundary on the east, where they are soon evaporated in a large lake; but before reaching it, they irrigate every portion of the plain and even of the city, and communicate to the former its matchless beauty and fertility. There is, perhaps, no city which has had a longer duration. From the earliest ages the existence of Damascus has been recorded, and always as a great capital. It is named in the history of Abraham; it is celebrated for its wars with the kings of Israel; it has survived all the variety of desolating revolutions which have passed over this part of Asia. Under the Turkish empire it has maintained a high importance, being on the route of the great caravans to Mecca, whence even the Turks esteem it holy, and call it the "gate of the Caaba." This causes not only an immense resort, but a great trade, which the pilgrims are careful to combine with the pious objects of their journey. Damascus has lost the manufacture of sword blades for which it was famous in the middle ages; but it has still considerable fabrics of silk and cotton; and the fruits of the neighbouring plain, dried and prepared into sweetmeats, are sent to every part of Turkey. It is at present the most flourishing city in Syria; a distinction which it owes to the excellent character of several successive pachas, through whose exertions the whole of their territory has assumed an improved and cultivated aspect, which strongly contrasts with the desolate condition of that of Acre. Damascus is built of brick, and its streets are narrow and gloomy, like those of all other Turkish cities, the people reserving their magnificence for the interior courts and palaces. The great mosque, of which Europeans can obtain only stolen glances, is very splendid, and the bazaar has no rival in the East for convenience and beauty. Several of the streets have rivulets running through them, which afford plentifully the great Eastern luxury of water. Many of the coffee-houses are built on the banks, and the Turk enjoys the luxury of smoking and sipping his coffee while the cool stream is flowing at his feet. The delight of the Damascenes is to make excursions into the environs of the city, adorned with numberless gardens, and to the "plain of roses," covered with that beautiful flower in its utmost perfection. The Hebrew name of Damascus, or Demesk, is not now known to the Orientals, who call it Sham, or El Sham. The inhabitants, amounting to about 100,000, have a bad reputation in the East, where *Sham Shoumi*, "the wicked Damascene," has even passed into a proverb; but perhaps the alliteration may have had some share in promoting its currency.

3765. *Almost all the remainder of the plain of Eastern Syria* is watered by the Orontes, in its long course from south to north along the foot of Lebanon. Though it has not the brilliancy and beauty of that of Damascus, it is yet well fitted for grain and pasturage, and anciently produced them in abundance. In modern times, from its exposure to the plundering Arabs, against whom the government has not energy to defend it, it has been in a great measure abandoned. On this route, however, occur two celebrated cities, still not wholly deserted. The first is *Hems*, about 100 miles north of Damascus, on the site of the ancient Emesa. It was a considerable place under the Roman empire, having acquired notoriety, though not glory, as the birth-place of Heliogabalus. At present, only a fourth of its site is occupied; and the place is noted merely for some antiquities of inferior importance. Forty miles farther north is *Hamah*, once supposed to be the ancient Apamea, but which Pococke seems to have proved to represent Epiphania. That traveller found in it no coins more ancient than those of the Greek empire. Hamah, which Volney reckoned at only 4000, is supposed by Burckhardt to contain 30,000 inhabitants. They subsist chiefly by supplying the wants of the Arabs, who roam over the vast desert to the east as far as the Euphrates. These freebooters are deterred from their usual violent proceedings, partly by a tacit convention, but more effectually by a body of 300 or 400 horse, stationed here for that purpose by the Pacha of Damascus. *Famieh*, called by Burckhardt *Kalaat-el-Medyhr*, is a mere village, with an old castle, containing all that remains of the real Apamea. This spot, where the kings of Syria once maintained 500 elephants and 30,000 horses, is now so marshy and inundated, that it can scarcely support a few buffaloes. Volney allows it 2000 inhabitants. It is situated near the banks of a considerable lake abounding with fish.

3766. *As the Orontes approaches the lower part of its course*, it is bordered on the east by a range of mountains, which reduces to a breadth of six or seven miles the valley through which it flows. This valley, inundated during the summer, yields fine pasture. Burckhardt there found the village of *Hoashu*, containing about 140 houses; and farther down, on the borders of the territory of Aleppo, is the large but dirty town of *Shogger* or *Shoggle*.

3767. *That we may visit Palmyra* before quitting the Orontes, we must make an excursion into the depth of the Syrian desert, which extends far to the eastward. The traveller sets out from the small village of *Hussia*, to the south of *Hems*. He finds himself on a great naked plain, where the stunted shrubs afford but a scanty browsing to the antelope. At the distance, however, of every three or four hours of march, occur little villages, or rather clusters of huts, where rest may be obtained: *Sodoud*, *Houarein*, *Karietein*. From the last place Palmyra can be reached only by a march of twenty-four miles over an expanse of uninterrupted desert. When this weary route has been passed, the hills, which have hitherto run in parallel lines about ten miles distant from each other, close in, and form a narrow valley, traversed by a ruined aqueduct, and on whose sides appear a number of tombs. At length the valley opens, and the eye is struck with a most amazing extent of ruins, covering a wide expanse of the desert; behind which, towards the Euphrates, stretches a level waste, as far as the eye can reach, without any object manifesting either life or motion. In this surprising scene, the front view presents a range of Corinthian pillars, occupying a space of more than a mile, and behind which, crowds of other edifices appear in dim perspective. The grandest, and also the most entire structure, is that called the Temple of the Sun. The court of this temple has a wall nearly complete, in which appear twelve noble windows. Behind rise the ruins of the temple itself, almost wholly

composed of magnificent ranges of Corinthian columns (*fig. 559.*) supporting a rich entablature, which has, partially at least, resisted the injuries of time. The

PALMYRA.

eastern gateway, on which all the resources of Grecian art have been lavished, is still in a tolerably perfect state. A noble arch, farther to the right, forms the commencement of a truly superb colonnade, which, even in its shattered and broken state, may be traced to the distance of 4000 feet. The vacuities left by the fallen columns open a view to the other ruins; and the remains of mag-

nificent structures are seen through the intercolumniations. Sometimes a group of three or four columns, standing entire, indicates some grand edifice, of which they are all that is left. But besides these ruins, from which definite indications may be drawn, a vast number of scattered columns cover the plain, some with and some without their entablatures; and the ground is every where strewn with broken pillars, scattered capitals, defaced sculptures, and large marble fragments, all lying prostrate in the dust.

3768. *The early and high importance of Palmyra*, or Tadmor, appears evidently derived from its being the channel by which Indian commodities passed across the desert to the countries of the West. Solomon, who occupied and enclosed it with strong walls, is reported as its founder; but was probably attracted by the wealth which commerce had already drawn to this desolate spot. The historical greatness of Palmyra, however, began only in the reign of Aurelian, when the spirited and high-minded Zenobia ventured to establish it as an independent kingdom, and to set at defiance the master of the Roman world. The issue of this daring attempt was fatal; Zenobia was carried in chains to Rome; and Palmyra never again recovered its prosperity. At present, beneath these hallowed monuments of a polished people are seen about thirty mud-walled cottages; the inhabitants of which, poor in the extreme, obtain a subsistence by cultivating a few detached spots, and feeding some flocks of goats and sheep. Two small tepid streams, impregnated with sulphur, which traverse the ruins, and are absorbed in the sand, might to ancient industry have afforded facilities for considerable culture.

3769. *Another portion of Syria still remains*, which has long been pre-eminent over the rest in power and commerce. It constitutes the pachalic of *Aleppo*, a sort of division which we have not much regarded, but which here coincides with that formed by nature. The vast mountain chain which has hitherto crossed Syria from north to south, sinks gradually, until it entirely disappears; but the mighty range of Taurus, projecting from Asia Minor, and crossing towards the Euphrates, here forms the northern boundary of Syria. It leaves, however, an interval of luxuriant plains and groves, which long rendered this region the pride of Syria, and the chosen seat of pomp and pleasure. Antioch, both under the Greek kings and under the Roman dominion, was celebrated as the gay capital of the East. Under the Turkish government it has yielded precedence to a rival of later origin.

3770. *Aleppo*, the modern capital of Syria, is, as it were, only an outpost of that country, and half belongs to the desert. From a number of low hills, however, which surround the city at a few miles' distance, streams descend, which water the chalky soil of the environs, and enable them to be formed into those beautiful gardens, with which the inhabitants of the East studiously surround their cities. Those of Aleppo are chiefly filled with fruit trees, of which the pistachio is the special boast. The city has some marks of antiquity, though none of them striking, and is usually supposed to be the ancient Beræa. It is built on several hills, above which are seen towering numerous minarets and domes which command a delightful prospect, especially to the eye fatigued with the monotony of the brown and parched plains that stretch around. Aleppo is very populous; Dr. Russel, who resided there for many years, reckons the number at 235,000, and is probably more to be depended on than other early travellers, who raise it to nearly 300,000. Volney, on the other hand, calculating that Aleppo does not stand on more ground than Marseilles or Nantes, and that the houses have only one story, reduces the estimate to about 100,000; but these data seem too vague to stand against the positive and careful calculations of other travellers. Seetzen has lately assigned 150,000; but whether that number result from a decline in the place, or a different mode of estimate, may admit of question. Aleppo is generally accounted the third city in the Turkish empire, yielding only to Constantinople and Cairo. This greatness it owes to the vast extent of its inland trade, for which it is most favourably situated, in front of Syria, and in close vicinity to Asia Minor, Armenia, and Persia. It is also a rendezvous for pilgrims from all these countries to Mecca. Although it contains no grand monuments, nor even any very magnificent modern edifices, it is yet reckoned the neatest and best built of the Turkish cities. At least its streets have those negative qualities which are almost all that can be expected in an Eastern city. They are less narrow, less dirty, and the walls, built of a species of white stone, have not quite so gloomy an aspect. The society is also represented as displaying more of toleration and urbanity than that of other Mahometan cities. This may be chiefly owing to the many strangers, of all religions, who are attracted

by its commerce; since the Christian population alone is reckoned at 31,000, and the Jewish at 5000. A violent principle of schism had, however, always subsisted between the janissaries on one side, and the pacha with his adherents on the other. While the Ottoman power remained entire, the latter easily maintained their predominance, and the discontent of the janissaries was vented in occasional tumult or impotent growling. In 1804, however, after a somewhat bloody contest, they succeeded in making themselves masters of the city. Aleppo thus, like Algiers and Tunis, became subjected to the sway of a turbulent soldiery. It suffered, but not in an equal degree. The janissaries preserved a good police, and chiefly employed themselves in systematically extorting as much money as possible from the inhabitants. Each of the latter was obliged to purchase, at a high rate, the protection of a janissary, and having paid this price he was secure in the possession of his remaining property.

3771. *Within the last ten years Aleppo has been visited by a calamity of the most dreadful nature, which has rendered its future existence as a city problematical. On the night of the 13th of August, 1822, not only the city itself, but every town and village in the pachalic, were shaken almost to pieces by an earthquake, which was felt from Diarbekir to Cyprus. The most appalling picture is drawn of the horrors of that dreadful night; the awful darkness, the quick repetition of the most violent shocks, the crash of falling walls, the shrieks, the groans, the accents of agony and despair, with which the city resounded. Twenty thousand persons are supposed to have been killed, and the same number bruised and maimed. Those who, amid falling houses, through heaps of rubbish, and stumbling over dead bodies, succeeded in reaching the open fields, found themselves destitute even of food and shelter. Exposed to a tropical sun and to nightly damps, and scantily fed, a large proportion became a prey to disease; and even the liberal subscription collected in London for the sufferers proved a very inadequate relief. It has been supposed that Aleppo would never again rear its head, and that its commerce would be removed to Smyrna. But its site possesses advantages which cannot be transferred elsewhere, and which must always, it should seem, occasion the existence of a great city in this part of Syria.*

3772. *The remaining cities in the pachalic of Aleppo present only faint traces of that grandeur by which they were formerly distinguished. Antioch (fig. 560.), the ancient queen*

560

ANTIOCH.

of the East, is only a poor, ill-built, little town, containing, according to Colonel Squire, not more than 11,000 inhabitants. This city was built by Antiochus and Seleucus Nicator, and was the capital of the Græco-Syrian dynasty. Under Rome its wealth and distinction were still further augmented; and it became, at an early period, the seat of the most flourishing of the Christian churches. In the great crusading expedition, Antioch was the first place which fell into the

hands of the Christians; and it continued a main centre of their power till 1269, when it was taken by Bibars, the sultan of Egypt. All the fury of Mahometan bigotry was then let loose upon a city long supposed a main bulwark of the Christian power. Its churches, accounted the finest in the world, were razed to the ground, and the site of those edifices, once the boast of Asia, can now with difficulty be traced. Aleppo, under Moslem auspices, became the emporium and capital of Syria; and Antioch soon sunk into insignificance. For the reason above stated, scarcely a remnant is left of those structures which rendered it the pride of the East. The most remarkable object is a portion of the city wall, which has resisted so many disasters, and even earthquakes. It is of great strength, built of stone, and defended by noble towers, at equal distances. In some places it is carried up the hills which border the city on the side opposite the Orontes; in others, along almost perpendicular heights. Yet a walk, rendered accessible by steps, has been carried all round it. The aqueducts also remain, and are fine, though not more so than those of some other Eastern cities.

3773. *The environs of Antioch have been particularly famed for their luxuriant and romantic aspect. Indeed, the banks of the lower Orontes, for a considerable space, are said to equal any thing in the world in point of picturesque beauty. Mount Casius, the termination of Lebanon, towers above it to a very lofty height, and the inferior mountain ranges run along the river, presenting broken precipices, rocks, and caves overhung with a luxuriant variety of foliage; myrtle, laurel, fig, arbutus, and sycamore. Travellers have particularly sought the grove and fountains of *Daphne*, celebrated for the temple of Apollo, and the dissolute superstitions of pagan Antioch. The site is usually fixed about five miles from the city, on the road to Latakia, and on a spot where a number of fountains, bubbling out of the earth with a loud noise, terminate in two beautiful cascades which fall into the valley of the Orontes. Instead, however, of magnificent temples and stately groves, it exhibits only a few clay-built water-mills surrounded with dwarf myrtles.*

3774. *On a plain to the south of the Orontes is the straggling seaport of *Suadeah*, and near it the remains of *Seleucia Pieria*, a city of great importance under the kings of Syria. Strength seems to have been chiefly studied, with the supposed object of forming a retreat in case Antioch should ever fall into the hands of an invader. There are still remains of a double wall built on high cliffs overlooking the bed of a mountain torrent. The outer wall is built of very large stones, and the inner defended by turrets of fifty paces apart. There are also remains of large piers which formed and defended the harbour. Pococke calls the place *Kopse*, and notices a singular ornament used there by the females, consisting of coins stuck round their head-dress, many of which, having been obtained from the ruins of Seleucia, were valuable as antiquities.*

3775. *About thirty miles to the south-west of Antioch is Scanderoon, or Alexandretta, which the Turks made the port of Aleppo. It possesses a very fine road, the only good anchorage in all Syria. On the other hand, extensive surrounding marshes render the town subject to epidemic diseases in a degree beyond any other in the Turkish dominions. Being, therefore, inhabited only by those whom the absolute necessities of commerce compel to make it their residence, it has never been any thing more than a large open village; and, of late, a great part of its trade has been transferred to Latakia. The only resource which the residents of Scanderoon possess, is an occasional retirement to Bedan, a cool and delightful village situated, among the mountains of the west. The houses are built along the declivity of a hill, so that the terraced roofs of one row serve as streets to the row immediately above.*

SUBJECT. 3. *Asia Minor.*

3776. *Asia Minor, another of the great divisions of Asiatic Turkey, derives a deep interest from sources unconnected with the degraded race by which it is now ruled. Its physical features, indeed, are not on so sublime a scale, nor does its past history recall events so awful and solemn as those which distinguished the banks of the Jordan and the Orontes. Still, the scenes of nature which it presents are full of grandeur, and its antiquities are replete with historical interest.*

3777. *Asia Minor forms a large oblong peninsula, about 700 miles in length, and somewhat more than 400 in breadth. It is almost completely separated from the rest of Asia, not only by the sea, which surrounds the greater part of it, but by the almost impassable mountains and elevated wastes which closely bar the broad isthmus by which it is joined. The structure of this country is remarkable. Its interior is completely encompassed with a girdle of lofty mountains. They run parallel to the sea-coast, sometimes closely approaching it, sometimes leaving intermediate plains and valleys of considerable extent. On the north runs the celebrated chain of Taurus, which extends across to the Euphrates, and was supposed by the ancients to intersect the whole of Asia. On the west it is continued by Tmolus and Sipylus, and these lock in with the southern chain, of which the most remarkable summits are those denominated Ida and Olympus. We give the classic appellations; for Ala Dag, Baba Dag, and other uncouth names imposed by its present possessors, will scarcely be endured by European ears. These mountains enclose a vast interior hollow, which is, however, considerably elevated, and into which they pour almost all their waters. We must, indeed, except those of the east, which are conveyed by the Halys, the modern Kizil Irmak, into the Black Sea; and part of the western waters, which find their way by the Sangarius into the same receptacle. But Mr. Leake calculates that there is an interior space, of 250 miles in length and 150 in breadth, of whose copious waters no part finds its way to the sea. They terminate in a long chain of little saline lakes, and during the rainy season cause wide inundations. It is even supposed that, at that period, the whole region would be laid under water, but for some elevated ridges by which it is penetrated. A territory covered with such profuse moisture would require a more industrious people than the Turks, to render it fit for the production of grain. It forms an immense range of pasture, over which are led numerous flocks of sheep, droves of horses, and, in the hilly tracts, herds of goats; while the inhabitants lead nearly the same irregular and nomadic life which prevails among the Tartar hordes.*

3778. *The part of Asia Minor which intervenes between the mountains and the sea presents a different and more smiling aspect. This is particularly the case with the western tracts of the peninsula. The Cayster, the Caicus, the Meander, and the Hermus roll through enchanted valleys stored with the richest gifts of nature. Taurus, on the south, presses closer upon the sea; but it still leaves ranges of finely watered, though not extended, valleys. On the northern shore, also, which extends along the Euxine, the interval between the mountains and the sea is often very narrow; though the plains of Sinope, of Amisus, and of Trebisond have been the seat of great and powerful kingdoms. They are marked, however, rather by the substantial productions of grain and pasturage, and in the mountains by the useful minerals of copper and iron, than by the gay fruits and smiling luxuriance of the south and west.*

3779. *In history, the interesting transactions connected with Asia Minor have been so numerous and varied, that we can attempt only a very rapid enumeration. The first picture is that of its nations when arrayed against Greece in the Trojan war. Troy, in that great contest, drew auxiliaries from Caria, Syria, Mysia, Phrygia, and Mæonia, so that it became almost a contest of Greece against Asia. Even the Greek pencil of Homer seems to delineate on the Asiatic side a people more polished and humane, though less energetic and warlike, than their invaders. Afterwards in the republics of the refined and effeminate Ionia, we find an early perfection of the sciences, poetry, music, and sculpture, then unknown to Greece, though that country, in arts as well as in arms, soon eclipsed the glory of its masters. Here, too, the kingdom of Lydia was early famous, first for power, but much more afterwards for wealth and luxurious effeminacy. These unwarlike states soon yielded to the arms of Persia, were included within its empire, and their arts and resources served only to swell the pomp of its satraps. In this humiliating situation, they lost all their former high attainments; and it became of little importance that they passed sometimes under the sway of Athens, and were ruled by Greeks instead of barbarians. After the conquest of Alexander, however, and when his rapidly formed empire fell so suddenly to pieces, some of the most conspicuous among the fragments were kingdoms established by his successors in Asia Minor. It was there that Antigonius and Demetrius collected a great portion of the resources with which they made such a mighty struggle for the supremacy among the Macedonian chiefs. After their fall, the kingdom of Pergamus was founded, whose princes, by their own ability, and the alliance of the Romans, became for some time the most powerful in Asia. Their glory, however, was surpassed by that of a kingdom formed in the opposite quarter of the peninsula, that of Pontus, by the powerful character and high exploits of Mithridates, under whom the last great stand was made for the independence of the world, which with him finally sunk. Asia Minor was*

reduced completely into a Roman province, and made few and feeble attempts to shake off the yoke. It was chiefly distinguished in ecclesiastical history by the formation of apostolic churches, and the assemblage of general councils; of which those of Nice and Chalcedon, in particular, had an important influence on the belief and worship of the Christian world. Protected by its distance from Arabia, and by the mountain chains of Taurus, this peninsula escaped in a great measure the tide of Saracen invasion. That great succession of hordes, however, who, under the appellation of Toorks or Turks, poured down from the north-east of Asia, after conquering Persia, crossed the Euphrates, and established a powerful kingdom in Caramania. Being divided, however, and crushed under the first successes of the crusaders, the Turkish power sunk into a languishing and almost expiring state. Suddenly, however, from its ashes, rose the family of Othman, who, collecting the Turkish remnant, and combining it with the neighbouring warlike tribes, allured or compelled to this standard, formed the whole into a vast military mass, which there was no longer any thing adequate to oppose. This power continued to have its principal seat in Asia Minor, until Mahomet II. transferred to the Ottoman Porte the dominion of the Cæsars, and made Constantinople the capital of his empire. Asia Minor, however, has always continued more entirely Turkish than any other part of the empire; and it is thence chiefly that the Porte continues to draw those vast bodies of irregular cavalry which form the chief mass of its armies. The peninsula has not, however, been exempted from that spirit of revolt which, amid the weakness lately exhibited by the Porte, has become so universal. The different pachas act nearly as independent princes, make peace or war with each other, and can only be displaced by manœuvre or intrigue. Paswan Oglou, in particular, established at Ooscat an independent kingdom, supported by an army of 40,000 men, and scarcely yielded to the Porte a nominal submission.

3780. *The Turks have made a political division* of Asia Minor into pachalics; of which the principal are Anadoli on the west, Trebizond on the north coast, Sivas and Konieh in the interior, Adana on the south coast, and the Mussellim of Cyprus. For reasons already stated, however, we shall not pay much regard to this ephemeral division, but recognise the country chiefly under other names which, though unknown in its present fallen state, are alone interesting to a European reader.

3781. *The local survey* to be made of this region, will most advantageously commence from the south-eastern corner, where the narrow pass of *Issus* allows the only communication with Syria and the countries on the Euphrates; and where Alexander, by a signal victory, opened his way into the boundless regions of Asia. Pococke and D'Anville place this celebrated spot near the village of Ayas, in a plain two miles long, and three quarters broad, enclosed between the hills and the sea. Mr. Kinneir, after a careful survey, seeks to transfer it to another plain more spacious, two miles in width, hemmed in by loftier mountains, and about sixteen miles north of Scanderoon. He contends that this space was necessary to enable two such armies to be drawn up in order of battle; and that it agrees with the data given by the ancient historians and geographers. We have not space to enter into the minute details of this controversy. Pias was till lately the wealthy and populous seat of a marauding freebooter, who plundered the caravans, and laid the neighbouring districts under contribution; but the Porte having succeeded in reducing him, his capital also went to ruin.

3782. *The ancient Cilicia*, now the pachalic of Adana, consists of two districts; the mountain range, composed of some of the most lofty and rugged branches of Taurus; and the level tract, composed of the two considerable and extremely fruitful plains of Adana and of Taurus. Adana, situated on the Gehoun, the ancient Sarus, is a very ancient capital, and still a flourishing town surrounded by extensive cotton plantations, tolerably built, and presents, in testimony of its former magnificence, some walls and a magnificent gateway. Its situation is agreeable, on a declivity above the river, which is larger than the Cydnus, and enclosed by fruit trees and vineyards. Tarsus retains its name and its position on the Cydnus; but Mr. Kinneir sought in vain for any monuments corresponding to its great name. The materials of all its ancient structures seem to have been taken down to build the modern city, which has thus a neater appearance than is very usual in Turkey; but as these fine hewn stones are merely built into houses of one story high, the place has no air of magnificence. Tarsus was not only the capital of Cilicia, but, under the auspices of Rome, rose to be one of the principal cities of the empire, both for wealth and for the cultivation of science and literature. It may be recollected as being the birth-place of St. Paul; and there is still an ancient church which bears his name. Tarsus continues a populous and stirring place. Its population, as well as that of Adana, is estimated at about 30,000 each; to a great part of whom, however, these cities afford only winter quarters. The Turcoman shepherds who, in summer, pasture their flocks on the heights of Taurus, during the rigorous season seek shelter for them in the rich plains around these cities. That of Adana is of exuberant fecundity, and, being tolerably cultivated, yields wheat, barley, sesame, and cotton, not only for home use, but in large quantities for exportation. To these are added copper from the northern districts, and gall nuts from the mountains. The returns are taken in coffee, rice, sugar, and hardware. Tarsus, however, is seven or eight miles from the sea.

3783. *To the east of Adana is another plain* equally fertile, on which the ancient Mopsus, or Mopsuesta, is still found under the name of Messis. This place, however, has been occupied by a band of Turcoman depredators, who have reduced the plain around to a state of desolation, and the place itself to a poor village, composed of mud cottages.

3784. *At the western boundary of Cilicia* begins the coast of Pamphylia, to which the moderns give the name of *Caramania*, from an early Turkish kingdom formed upon the coast, of which Karaman, in the interior, was the capital. This tract consists of a succession of valleys separated by ridges that branch from the loftier heights of Taurus. These valleys, though often narrow, are usually watered by fine streams, and very fertile. The ridges often terminate by presenting to the sea, in the boldest and most picturesque forms, lofty perpendicular cliffs of limestone or marble.

3785. *Selefkch*, on the Ghiuksu (the ancient Calycadnus), a river of some magnitude, is merely an assemblage of cottages built of wood or earth; but near it are considerable vestiges of the ancient *Seleucia*. There is a theatre partly cut out of the side of a hill; and in front of it a long line of porticoes and other remains of large ancient edifices. In the vicinity is an extensive necropolis or cemetery, consisting, as usual, of numerous tombs cut in the rock, with some sculpture, and a variety of inscriptions. An aga resides here, subject to the governor of Cyprus. Farther up the river, near its junction with a tributary called the Erminah, is *Mout*, a miserable village of 200 hovels, built with reeds and mud, while some wretched inhabitants seek their abode in the rocky caverns. This, however, was the site of a magnificent ancient city, supposed by Mr. Kinneir to have been Philadelphia, the plan and principal edifices of which may be distinctly traced. The cottages are intermingled with long colonnades and porticoes, still partially standing; and pillars of verd antique and other marbles lie half buried, or covered by ruined mosques and houses. The castle is large, and nearly entire; it is built on a precipice overhanging the Ghiuksu; its walls are surmounted with battlements flanked by square towers open to the interior. This scene of wretchedness, the result of misgovernment, is found in a valley, the aspect of which promises peculiar fertility. It abounds also with the most beautiful scenery; the pastures, groves, and streams, of the lower tracts contrasting admirably with the majestic forms of the mountains above, and the dark woods with which they are covered.

3786. *Proceeding westward along the coast from Selefkch*, is found *Kelendri*, called by the Turks Gulnar, a few wretched hovels, built amid the ruins of the ancient Celenderis, which lie about in scattered and mouldering heaps. Here, however, a magazine and a custom-house are kept, to maintain the communication with Cyprus.

3787. *Looking from Kelendri*, on the opposite side of a small bay, a grand feature presents itself in Cape Anamour, the most southerly point of Asia Minor, presenting to the Mediterranean a bold, and on one side inaccessible, cliff. The other side is secured by a castle, and a double range of lofty walls, within which are the remains of the ancient Anemuria. It appears to have been considerable; but scarcely a block or fragment of marble remains. Only the abodes of the dead remain entire, exhibiting a remarkable proof of the durability of their materials, compared with those which formed the habitations of the living. These tombs, many o

which display considerable magnificence, have all been opened ; but their walls are still standing. The spot is entirely deserted ; but about six miles distant is the modern castle of Anamour, a large edifice, now going to ruin.

3788. Cape Anamour is succeeded by a range of rocky coast, at only two points of which torrents penetrate into the sea : here ruins are all that indicate the site of *Charadrus* and *Antiochia ad Cragum*. At the end of this coast, the lofty and romantic cliffs of Cape *Selinty* project into the sea. On its pinnacle are the remains of a castle, which looks down perpendicularly from a great height upon the waters. At its foot, along the banks of a river, are the foundations of large edifices and bases of columns in long ranges, all the superstructures having been carried away. These are the remains of *Trajanopolis*. To the west is a beautiful plain, five or six miles in extent.

3789. Proceeding westward, the traveller meets numerous towns and villages, modern upon ancient sites, but both deserted, bearing marks of the desolation which now reigns in this part of the empire. At length are espied the white cliffs of *Alaya*, rearing themselves high above the waves. This mountain fortress, called in the middle ages *Castel Ubaldo*, is compared by Colonel Leake to a second Gibraltar. Two of the sides are absolutely perpendicular, the other is completely fenced with high solid walls and towers. The town, situated near the foot of the hill, is about a mile in circuit. It scarcely contains any vestige of *Coracesium*, on whose site it stands ; and as a modern town, though the residence of a sangiack, it is poor, destitute of commerce and thinly peopled, having, according to Captain Beaufort, only 2000 inhabitants.

3790. On a low and desert promontory, to the westward of *Alaya*, Captain Beaufort discovered the superb monuments of *Side*. They are numerous ; but the prominent object is a theatre, the most extensive preserved among those of the many Greek cities of Asia Minor. It is half excavated, half composed of masonry, and has an exterior diameter of 409 feet. There are forty-nine rows of seats, all of white marble, and of admirable workmanship. On these might sit 13,370 persons ; and by standing or sitting on the steps, an audience of 15,240 might be accommodated. Among other remains are those of a building dedicated to astronomical purposes ; those of a spacious bath ; and many others, now scarcely to be distinguished amid the thorns and brambles with which they are overgrown. The traces of a spacious double harbour accord with the report given by *Livy*, of the naval skill and prowess of the *Sidetians*.

3791. Passing *Laara*, the ancient *Magydos*, *Dashashehr*, and some smaller places, we come to *Attalia*, called by the Turks *Adalia*, and by the Italians *Satalia*, the principal town in this quarter. *Attalus Philadelphus*, by whom it was founded, made it his capital, and spared no cost in adorning it. The situation is peculiarly beautiful, along the side of a rising hill which fronts the sea, and upon which the streets are arranged like the seats of a theatre. Its ancient importance is attested by numerous granite columns and fragments of sculpture, particularly by a magnificent gateway of the Corinthian order. The gardens behind, interspersed with country houses, are filled with the finest fruit trees, and refreshed by the breezes from Mount *Taurus*. The population is estimated at 8000, of whom two thirds are Mahometan, and the remainder Greek. A considerable trade has of late been carried on in grain, which is copiously produced in the surrounding fields, watered by streams that are loaded with calcareous deposits.

3792. The coast now takes a southerly direction, forming a side of the deep bay at the bottom of which *Attalia* is situated. On this coast are found the ruins of *Phaselis*, in a swampy and unhealthy situation, at the foot of Mount *Solyma*, which rises to the height of 7400 feet, and by its frowning aspect, and the formidable sounds which echo through the caverns, inspires the natives with superstitious dread. *Deliktash*, situated on a plain, enclosed by mountains, is filled with the remains of the ancient *Olympus*. Its name, signifying the perforated rock, designates the principal object for which it is remarkable. Places of only secondary importance occur until, after passing Cape *Khelidonia* (the ancient *Promontorium Sacrum*), and reaching the river *Andraki*, we discover the ruins of the ancient and celebrated city of *Myra*. A theatre, tolerably entire, 355 feet in diameter, with other remains of public buildings and inscribed sepulchres, mark its ancient splendour. It is situated three miles up the river, in a plain, fertile, and tolerably cultivated. Westward, along the coast, is a crowd of rocky islands, abounding with fine creeks and bays, which might render them the seat of a considerable commerce and population. That they were so anciently, appears clearly from traces left on those of *Kakava* and *Castelorizo*.

3793. Winding round the interior of a deep and circuitous bay, we find at its eastern head *Macri*. This town, having an excellent harbour, is employed by the government as its medium of communication with Egypt. It exports firewood to that country ; timber, tar, cattle, and salt to Rhodes. It is, however, rendered extremely unhealthy by an almost constant malaria, arising partly from the damps of ancient edifices, partly from its situation, in a pit, as it were, amidst overhanging mountains which produce confined air and frequent chilling breezes. Nothing can exceed, in gloomy grandeur, the aspect of this part of Asia Minor, presenting an unbroken range of mountains, the tops of which are covered with perpetual snow.

3794. Near *Macri* are the ruins of the ancient *Telmessus*, which rank with the grandest and most perfect of any in Asia Minor, and have been described by Dr. Clarke in a manner peculiarly careful and interesting. The first object which strikes the spectator from the sea, consists of the remains of a spacious theatre (*fig. 561.*), built on the side of a mountain, to

561

THEATRE AT MACRI.

whose shelving sides the structure was adapted. Several of its portals are yet standing, of enormous magnitude, and built of stones eight or ten feet long, put together without any

cement. Dr. Clarke observes, that, "in the plans of Grecian architects, the vast operations of nature were rendered subservient to works of art; for the mountains on which they built their theatres possessed naturally a theatrical form, and towering behind them, exhibited a continuation of the immense *koilon* which contained the seats for the spectators, giving a prodigious dignity to their appearance. Every thing at Telmessus is Cyclopean: a certain vastness of proportion, as in the walls of Tirynthus or of Crotona, excites a degree of admiration mingled with awe; and this may be said to characterise the vestiges of the Dorian style

all over Asia Minor." Peculiar care has here been taken in adorning the tombs both with sculpture and architecture. The greater have both their interior chambers and the columns in front excavated out of the solid rock; and the stones are joined together so nicely, as to make it almost impossible to discover the entrance. Other tombs represent the Grecian *soros*, consisting of huge single stones pitched often on the summits of high rocks. Others, again, consist of a number of these stones joined together; and one was of such magnitude, that Dr. Clarke conjectured it might be the mausoleum of Artemisia (*fig. 562.*).

TOMBS AT TELMESSUS.

3795. *Emerging from the Gulf of Macri*, and passing along the deserted sites of Colynda and Cannus, the former capital of Peræa, the navigator descries a narrow passage, through which, if his vessel reach the dimensions of a frigate, he will work his way with some difficulty, unless the wind be favourable. On entering, however, he finds himself in the spacious bay of Marmorice, twenty miles in circumference, and which its lofty wooded shores secure from every wind. The town, at the head of the bay, is small, composed of whinstone cottages like those in the highlands of Scotland.

3796. *As we approach the confines of Ionia* and the western coast, the monuments of antiquity become more numerous and striking. The two deep bays of Symi and Cos, which follow almost immediately after that of Marmorice, are nearly unexplored by the moderns. At Cape Crio, however, the point of separation between them, are found the extensive ruins of *Cnidus*. No Greek city is said to present more varied specimens of ancient architecture; and in none has the work of destruction been more active. The whole area of the city is one promiscuous mass of ruins, amongst which are numbered three theatres, one of them 400 feet in diameter; several temples, many tombs, and some superb fragments of sculpture. The white marble steps of one of the theatres may still be found buried under the grass and bushes, and near it are the fragments of a Corinthian temple of the same materials. The remains of two artificial harbours, formed by long piers projecting into the sea, may still be traced.

3797. *At the head of the Gulf of Cos* is Melasso, rather a considerable modern town, the residence of an aga, though ill built; but it is distinguished as occupying the site of Mylasa (*fig. 563.*), once a capital of Caria. The temples of this city were in ancient times

so numerous, that a crier, entering the market-place, instead of the usual exclamation, "Hear, ye people!" called out, "Hear, ye temples!" They are now almost entirely demolished; and of one very fine portico, of the Composite order, which was found by Pococke, there remained, in Chandler's time, only the basement. The tombs are extremely numerous, and some are of peculiar structure. About ten miles to the south-east, Eskihissar, a poor modern village, stands on the site of Stratonicea.

ARCH OF MYLASA.

3798. *Lower down the same gulf*, to many parts of which it gives its own name, is Boodroom, on the site of Halicarnassus (*fig. 564.*). It is still a considerable Turkish cruising port, with a modern castle and palace that possess strength and magnificence. There are no remains at all entire, except that of a theatre overhanging the town; but the attentive eye of the traveller soon discovers numerous fragments indicative of the former existence of a magnificent city. A traveller of the sixteenth century asserts that he saw some vestiges of the mausoleum of Artemisia; and the exquisite beauty of several of the fragments now transferred to modern buildings seems to characterise them as having belonged to some

celebrated structure. Friezes inserted into the walls of the castle have been considered as specimens of sculpture equal to those of the Parthenon.

HARBOUR OF HALICARNASSUS.

adjoining whose beautiful site have been supposed by Spon and others to be those of Miletus (*fig. 565.*); but a different opinion now prevails.

MILETUS.

3800. *We have reached the finest and most celebrated region of Asia Minor; at the mouth of the Meander, whose winding stream waters the most extended and fertile of all the vales of Ionia. At every step we ascend occur the remains of magnificent cities. Those of Magnesia, on the Meander, are usually supposed to be found at Guzelhissar, itself a large town, and the Turkish capital of this district. It is about four miles in circumference, built on a hill which commands an extensive and beautiful view over the valley of the Meander, reaching downward as far as the sea. Even the city itself, though composed of the usual Turkish materials, presents considerable beauty in its exterior aspect, containing numerous courts and gardens, filled with orange and cypress trees, whose foliage mingles with its lofty minarets. Even the streets are broader and better disposed than is usual in Turkey. Guzelhissar is the residence of a pacha, and carries on a great trade in cotton and cotton yarn, part of which is manufactured within itself into coarse calicoes. These circumstances make it the residence of many Jews, and other rich merchants, and one of the most considerable places in Asia Minor. The ruins are scattered in fragments, and in general only their foundations can be traced; but Pococke saw on the north side remains of a very splendid temple, which appeared likely to be the celebrated one of Diana Leucophrène. Mr. Leake, however, places the site of Magnesia twelve miles lower down the river, at a place called Juckbazar, where Van Egmont found a number of large ruins. He makes the Guzelhissar ruins to be those of Tralles, which have been usually referred to the village of Sultanhissar, fifteen miles higher up, but where Mr. Leake finds the remains of Nysa. On the opposite side of the river, near the village of Yeni Bazar, is found a magnificent palace and other remains of the ancient Alabanda. Near Yeni Shehr are those of Antioch on the Meander, in a neighbourhood still celebrated, as in ancient times, for the excellence of its figs. Considerably farther up, some miles from the left bank, is Degnizlei, which was a large town at the beginning of the last century, when 12,000 of its inhabitants were swallowed up by an earthquake: it has since become a very poor place. From this point, the lofty cliffs and snowy pinnacles of the great encircling range, called by the Turks Baba Dag, the "father of mountains," begin to appear; but the foreground beneath them consists of a tract crossed by low calcareous hills. Amid these are the majestic remains of Laodicea and of Hierapolis.*

3801. *Laodicea is situated on a hill of dry, hard porous earth, which resounds under the feet; at the base of which flows the Lycus, a tributary of the Meander. It was founded by Antiochus, but did not rise to high importance until under the Roman empire, and about the Christian era. It presents, in shattered profusion, all the monuments which gave grandeur to a Grecian city; and its columns appear to have been formed of the most precious materials (*fig. 566.*). These remains cover the whole surface enclosed within the walls. At present the desertion is complete: there is neither house, church, nor mosque; a fox passing from behind a wall was found by Dr. Chandler the only inhabitant of Laodicea. On the opposite side, and nearer the Meander, is Hierapolis, whose mineral baths were formerly so celebrated. The mountain above it has been completely petrified by the*

566

STADIUM AT LAODICEA.

streams flowing down its sides, which have given it, when seen from a distance, the appearance of chalk, and, on a nearer view, that of an immense frozen cascade. The incrustation is alkaline, without taste or smell, and effervesces with acids. The ruins are extensive; a very beautiful and perfect theatre, the marble seats of which are still standing; two large churches; and, as might be expected, most ample and magnificent baths, composed of marble, combined with the petrified substances, and formed above into huge vaults, the appearance of which is almost awful. The site of *Colosse* appears to be in this neighbourhood, and has been fixed at a Turkish castle on a rock called Konous, which, however, presents no ruins of the requisite magnitude.

3802. *From the mouth of the Meander* the coast makes a large circuit, stretching out till only a narrow strait separates it from the island of Samos. This spot was the theatre of the celebrated naval action of Mycale, and has in our own times been distinguished by the exploits of the modern Greeks. The coast again bends inward, and we reach Scala Nova, a great modern Turkish sea-port, which carries on a considerable trade with Egypt and the neighbouring districts and islands. The population, prior to the late convulsions, was estimated at 1700 families, of whom more than a third were Greek. The site is that of Neapolis, and contains some ruins.

3803. *At a little distance from Scala Nova* is the mouth of the Cayster, which waters another of the beautiful vales of this fine region. Though every way inferior to the Meander, it contains one almost unrivalled site — *Ephesus*. This city, once the pride of Asia, is now represented by Aiasaluck, a poor village, of a few cottages, fallen even from what it once was as a Mahometan town. This is attested by a large castle and mosque, containing beautiful stones enriched with the finest sculpture: the traveller soon discovers, however, that these are not Ephesus, but fragments taken from its ruins. At the distance of half a mile, the traces of the city may be clearly recognised. The stadium, now converted into a cornfield, the theatre, the odeon, and the gymnasium (*fig. 567.*), may all be distinguished in outline, and their area is strewn with fine fragments. There is a particular part of the entablature of a Corinthian temple, delineated by M. Choiseul Gouffier, which, in the richness and variety of its ornaments, as well as their fine execution, has, perhaps, never been surpassed (*fig. 568.*). But it is not without difficulty, and even doubt, that he can determine the spot where stood that proud boast of antiquity, the temple sacred to Diana of the Ephesians. All that constituted the splendour of this edifice; its columns, of which 127 were the gifts of kings; its works of art, comprising the master-pieces of Apelles and Praxiteles, have disappeared. Af-

567

GYMNASIUM AT EPHESUS.

ter the temple had been repeatedly pillaged by the barbarians, Justinian removed the columns to adorn the church of St. Sophia at Constantinople. It can now be identified only by the marshy spot on which it was erected, and by the prodigious extent and magnitude of the arches raised above as a foundation. The vaults formed by them compose a sort of labyrinth, and pure water is knee-deep underneath. There is not an apartment entire; but thick walls, shafts of columns, and fragments of every kind, are confusedly scattered.

3804. *The Upper Caicus* presents, in its short course, no trace of any celebrated city. It has, however, on its southern bank a modern town, bearing the remarkable name of Tyria or Tyre, but presenting no monuments to justify the inferences which might be drawn from so remarkable a name. It is large and well built, and from fourteen to twenty minarets, rising amid trees and surrounding gardens, give it a very beautiful appearance. Its flourishing state is due to its situation in the finest part of the vale of Cayster, which yields large crops of rice, and affords the richest pastures.

3805. *From the mouth of the Cayster* the coast sweeps out into an extended peninsula, which runs parallel to the island of Scio; after which it turns inward, and forms a side of that deep bay, at the head of which *Smyrna* is situated. This modern capital of Asia Minor, and emporium of the Levant, presents almost the only remnant of that prosperity which was once so widely diffused. The situation is such, that Smyrna could scarcely fail to be a flourishing place. It has a fine bay, with good anchorage, a secure and capacious harbour, and, behind, a plain watered by the Meles, which produces abundantly fruits and vegetables. Although Smyrna be not placed in any of the great western valleys, it is so near, and in so central a position with respect to them all, that it can easily draw from them every valuable product. With so advantageous a site, this city rose early to eminence. Its first boast was to have given birth to Homer; and it was received, though somewhat late, into the Ionian confederacy. It was destroyed by the Lydians, but, having been rebuilt by Antigonos, rose then to its highest prosperity; so that Strabo pronounces it the most beautiful city of Asia. This praise it owed particularly to its gymnasium, its temple dedicated to Homer, and the general elegance and arrangement of its streets. Of the ancient edifices which stood on the hill above the city, only the ground plan can now be

traced, the whole materials having been removed for the purpose of building the modern Smyrna, which extends along the bay four miles in length and one in breadth. Its groves and minarets make a magnificent appearance from the sea; and the hill, though stripped of its classic edifices, has still a large Genoese castle on its summit. Within are gloomy walls, narrow and ill paved streets; but the houses along the shore are very delightful, having gardens stretching down to the water, and summer-houses at their verge. The city is liable to earthquakes, which, unless in 1739, have caused more fear than injury; and, what is worse, the plague seldom allows a year to pass without committing serious ravages. The population has been estimated from 100,000 to 120,000, of whom 30,000 are supposed to be Greeks, and 8000 Armenians. Upwards of 2000 Europeans, chiefly French, are settled here for the Levant trade, and form a numerous society within themselves, which enlivens the gloom peculiar to a Turkish city. The exports of Smyrna are those of Asia Minor; raw silk, cotton, carpets, mohair, raisins, drugs, and a few precious stones. The returns are chiefly in wrought silk, woollens, tin, lead, and glass.

3806. *From Smyrna*, after rounding a small promontory, we come to the mouth of the *Hermus*, the modern Sarabat, which watered one of the western valleys, rivalling in extent that of the Meander. At a considerable distance up, is another *Magnesia*, a celebrated ancient capital, which continues to be a large and populous town. Above rises a very lofty mountain, celebrated for the production of loadstone, whence the term magnet is supposed to be applied to that mineral. But the most remarkable place on the *Hermus* is that occupied by the ruins of Sardis, scattered over a verdant plain, near a miserable village, which yet retains the name of Sart. Of the Ionic temple of Cybele, the existing

568

ENTABLATURE OF TEMPLE AT EPHESUS.

remains show that it was one of the most stupendous of Grecian monuments, and the capitals of that order appeared to Mr. Cockerell the finest specimens he had any where seen. Some of the structures are of brick, and exhibit a striking proof of the durability which the ancients could bestow on that material. Five miles distant, near a small lake, is the tomb of Halyattes, celebrated by the ancients as a monument that might almost vie with those of Egypt or Babylon. This mound is a full quarter of a mile in circumference; but the rains have diminished its original altitude of 200 feet. We know not if Chandler has much ground for thinking that treasure would be found here, if any one would undertake the immense labour of digging.

3807. *We have still to survey the last and least of the Ionian valleys*, that of Caicus. It presents the name and the site of *Pergamos*, once the capital of a powerful line of kings, and containing a library which ranked only second to that of Alexandria. The place still flourishes, and has a great population, stated, perhaps too high, at 15,000. The ruins have not been accurately observed. In a fine plain, on a tributary of the Caicus, is a tolerably large but poor town, called *Akhissar*, on the site of the ancient Thyatira, of which, however, no monuments are now left. About fifteen miles distant is Kirkagatch, a town said to contain 10,000 inhabitants.

3808. *From the mouth of the Caicus*, the sinuosities of this coast form, with the opposite coast of Mitylene, a long succession of straits. On this part of Asia Minor lately rose *Aivali* or *Cydonia*. Half a century ago it was a poor village, when a Greek native, of the name of Economos, succeeded in obtaining from the Porte a firman, by which his countrymen on this spot enjoyed a protection, and even privileges, elsewhere denied. Under these immunities, and under the wise measures of Economos, who became the governor, Cydonia rose to be a sort of capital of the Greeks, and the centre of all the measures taken for their renovation as a people. A college was established there, which was soon crowded with youths ambitious to revive the ancient glory of the Grecian name. The adjacent country was brought into a state of high cultivation; large

manufactories of oil and soap were established. In 1820, Cydonia was estimated to contain 35,000 inhabitants: the houses were well built of stone; though, from the neglect of forming an original plan, they were arranged without order, and without any preventive against the accumulation of filth. The population was entirely Greek, and formed a sort of independent republic, governed by its own magistrates, and paying merely a tribute to the Porte. Next year, on occasion of the general rising of the Greek nation, the Pacha of Brusa sent a body of troops to occupy the place; a step which induced most of the inhabitants to abandon it, and seek shelter on the neighbouring islet of Mosconissi. A general descent being soon after made by the Greek fleet, the Turkish garrison was driven out; but, in retreating, they set fire to the city in more than twenty places; and the native population had scarcely time to make their escape, when it was reduced to a heap of ashes. No account has yet been received of its revival.

3809. *Passing round the Gulf of Adramyti*, with a small town of the same name at its head, we enter on a scene less adorned by nature and art, but surpassing in fame any of the splendid regions already surveyed. This is the "*campi ubi Troja fuit*,"—an interesting and mysterious subject; on which, in recent times, volumes have been written. Such a controversy would evidently be far beyond our limits. It is soon obvious that all the grand outlines of nature, as delineated by Homer, remain unaltered. The island of Tenedos, the neighbouring straits of the Hellespont, the plain traversed by several small and rapid rivers; and, behind, the lofty summits of Ida and the rugged steeps of Gargarus—these still form the characteristic features of *the Troad*. The details are involved in much greater perplexity. Perhaps, in regard to these, Homer may have been less exact, and may have taken such liberties as suited the objects of his poem. In a plain often inundated, considerable changes of surface and boundary may probably have taken place; and the parties in the controversy have assumed the right of supposing such as might best accord with their hypotheses. The leading data given by Homer are, the Scamander rising almost under the walls of Troy, from two fountains, one hot the other cold; the Simois afterwards flowing into it from the right; a plain between the Scamander and the Simois; and Troy from a height overlooking that plain. The actual features are, the Meander, a considerable mountain stream, which rises, however, as Dr. Clarke has shown, not near any possible site of Troy, but forty miles up the country, amid the heights of Ida. It receives, on the left, a rivulet from the height of Bonarbashi, the site of some hot springs, and several remarkable tombs; on the other, a small sluggish stream, called the Kallifat Osmack. A larger one, the Ghiumbrek, runs parallel to it on this side, but falls into the sea. The first hypothesis was that of Chevalier, according to whom Bonarbashi is the site of Troy, and the stream flowing from it the Scamander. He thus obtained for the site of the city a hill, the fountains, several large tumuli, and other ancient remains. Dr. Clarke, however, having clearly proved the Meander to be much the greater stream, and bearing still the ancient name, rejected the rivulet of Bonarbashi as unworthy of notice. The Simois appeared to him to be found in the Kallifat Osmack, which has a course of fifteen miles, and a tolerable body of water, but a slow current: floods, however, might render it "the rapid Simois." Between these rivers is the village of Tchiblak, which may, he conceives, have been the site of Troy. A late ingenious writer has sought to fix the Simois in the Ghiumbrek, supposed then to have fallen into the Meander, though its course is now changed. The intervening plain would afford ample room for the contending armies, and such as no other hypothesis presents; while within its circuit is a spot ascertained by Dr. Clarke to be the New Ilium of Strabo, believed, in his time, though not by himself, to be the spot on which Troy stood. Mr. Leake, again, has revived the almost forgotten hypothesis of Chevalier. He imagines that the Bonarbashi, in consequence of coming from Troy, was honoured with the principal name, while the Meander, above the junction, was considered merely as a tributary. In its height, in the two fountains, and in every other particular, it will then correspond to the description of Homer.

3810. *Dr. Clarke scaled the heights of Ida*, where he found the most rugged and romantic scenery, and

569

GYMNASIUM AT TROAS.

obtained from its summit a splendid view over a great part of Asia Minor. In the interior, on a fine plain, he found the village *Aene*, recalling the name of *Aeneas*; and *Beyramitch*, a populous town, the modern capital of the Troad. Below, opposite to Tenedos, appear the remains of *Alexandria Troas*, built by Antigonos and Lysimachus in honour of Alexander. Even now, when it has been robbed of most of its ornaments to enrich Constantinople, all the splendid appendages of a Greek city are traced on a great scale (*fig. 569.*); aqueduct, theatre, baths, and a very fine building, erroneously called the palace of Priam, the marble of which appears to have been covered with a coating of metal.

3811. *We now enter the narrow strait of the Hellespont* (the modern Dardanelles), forming the entrance into the Propontis or

Sea of Marmora. The passage is defended by two opposite forts, called the Castles of Asia; a little to the south of which are the remains of the ancient cities of Sestos and Abydos, rendered famous by the tragic loves of Hero and Leander.

3812. *As the Propontis approaches its eastern boundary*, it shoots up the long and narrow *Gulf of Modania*, about fifteen miles inland from which, to the south, is *Boursa*, or *Broussa*, the ancient Prusa, capital first of Bithynia, and afterwards, for a short time, of the Turkish empire, till the conquest of Constantinople, when the seat of government was transferred thither. Boursa is still a great and flourishing city, containing probably not fewer than 60,000 inhabitants. Its situation is noble, in a plain twenty miles in length, covered with magnificent forests, behind which, to the south, rise the snowy pinnacles of Olympus. The air is considered by Browne as very salubrious, with which quality, however, the ravages committed by the plague during Mr. Kinneir's residence seem ill to accord. The ancient structures have been entirely taken down, and re-constructed in the shape of modern mosques, which amount, it is said, to the number of 365, and some of them are very splendid. The ordinary houses are of wood; the streets very narrow, but clean; and Boursa is altogether a very fine Turkish city. Cloths are extensively manufactured out of the excellent silk and cotton produced in the neighbourhood; and a constant intercourse is carried on with Smyrna and Aleppo. These manufactures are chiefly in the hands of the Armenians, who inhabit the city to the number of 7000. Modania, which is situated on the gulf of that name, and may be termed the seaport of Boursa, is a town built of wood, inhabited chiefly by Greek sailors.

3813. *Only a few wretched cottages occupy the place of Nice*, so celebrated under the Lower Empire, particularly for two great ecclesiastical councils. Those humble dwellings are beautifully situated in a fine plain bordered by the lake, and enclosed by wooded hills, rising into the lofty heights of Olympus. At the end of this plain the yet entire circuit of its walls, with their lofty towers and massy gates, make a most magnificent appearance. The interior, however, presents an entire contrast. A considerable Turkish town had been built out of the ancient city; but this too is now deserted, and nothing appears but ruin upon ruin. The decaying walls of the mosques and palaces are seen every where variegated with columns and other fragments of the more ancient edifices out of which they were constructed.

3814. On turning the eastern boundary of the Sea of Marmora, we immediately descry another great fallen capital, *Nicomedia*, the modern *Is-Nikmid*. It was an early residence of the kings of Bithynia; but its highest greatness began under Diocletian, who made it the metropolis of the Roman empire, the wealth of which he lavished in raising it at once to a rivalry with Rome. In this character it was soon supplanted by Constantinople, and all its ornaments were probably carried off to embellish this new residence; for there does not now remain the vestige of an ancient city. *Is-Nikmid*, containing 700 families, has the appearance of a town entirely modern. Similar has been the fate of *Chalcedon*, so distinguished in ecclesiastical history; its unoccupied area is covered with cornfields and vineyards.

3815. *Scutari* is referred to Constantinople, of which it forms entirely a suburb. Passing, therefore, the Bosphorus, or channel of Constantinople, we reach the Black Sea and the coast of the ancient *Bithynia*. It is described as a romantic and beautiful country, intersected with lofty mountains and fertile valleys; rich in fruits and wine, and abounding in noble forests. Through this region the *Sikaria*, the ancient *Sangarius*, after traversing a great extent of the high interior plains, rolls a full and rapid stream into the Gulf of *Erekli*. A great part of its lower course is through a gloomy and intricate defile, bordered on each side by rugged perpendicular precipices. To the east of this river the country becomes very lofty and presents an aspect like that of Sweden, being covered with noble pine trees, above which rise the snowy tops of the mountains. These rugged and gloomy tracts enclose a large plain, in the heart of which lies *Boli*, the ancient *Hadrianopolis*, now a poor town of about 1000 houses, and twelve mosques; noted for the mineral baths in its vicinity. Due north from *Boli*, at the foot of stupendous mountains, is the seaport of *Erekli* (*Heraclea*), which still carries on some commerce, but retains nothing of the grandeur which it displayed under its original name.

3816. *Proceeding eastward, we enter the ancient Paphlagonia*, an elevated, rude, and naked region, with detached cultivated spots, but chiefly occupied by the pastoral tribes. The commerce is carried on by *Amassero*, formerly *Amastris*; by *Gydros*, once *Cyturus*; by *Ineboli*, *Inichi*; but above all by *Sinope*. This celebrated capital of Pontus, and emporium of the Euxine, though destitute of its former wealth and extensive fisheries, retains still a population of 5000 souls, carrying on an export trade in rice, fruits, and raw hides. Docks for the imperial navy are also maintained there, though no longer on a great scale. The modern metropolis of all this country, however, is *Kostamboul*, or *Kostamouni*, situated about thirty miles in the interior, in a bare dreary region, bounded on the south by the lofty ridges of *Olgassus*, one of the highest parts of the great encircling chain. It contains about 15,000 Turkish and 3000 Greek inhabitants, thirty mosques, and numerous baths. On a high perpendicular rock, in the centre, is a ruinous castle, that once belonged to the *Comneni*.

3817. *Eastward from Kostamboul* the country rapidly improves, being watered, among other rivers, by the *Kizil Irmak* (*Halys*), which is the largest in Asia Minor, and traverses, by a circuitous line, nearly the entire breadth of the continent. On this route we pass *Tash Kapri*, with 4000 families and thirteen mosques, situated in a rich valley, and carrying on some manufactures of leather and cotton. It is the ancient *Pompeiopolis*, and presents some beautiful remains of Greek architecture. Some of the pines in this neighbourhood measured sixteen feet in circumference, and were immensely high, well fitted to be "the mast of some tall admiral;" but they are left to rot, neglected and useless. Here, also, is found *Weiwode*, a large beautiful village, in a narrow valley watered by a rivulet, and surrounded by hills and groves. *Vizier Kapri*, beyond the *Halys*, situated in a rich pastoral district, has forty-six villages dependent on it, and contains 2000 inhabitants.

3818. A route almost directly east, through a picturesque mountainous and woody country, leads to the shores of the Euxine, and to *Samsoon*, the ancient *Amisus*. This city, celebrated first as an independent Milesian colony, and afterwards as a residence of *Mithridates* and *Pompey*, has not now above 2000 Turkish inhabitants; but many of the adjacent villages are inhabited by Greeks, who carry on a brisk trade with Constantinople.

3819. *The ancient kingdom of Pontus*, which we are now traversing, consists, in a great measure, of a very flat plain along the sea-shore, in many places highly cultivated; in others, the streams, unable to reach the sea, spread into swamps and morasses. About

thirty miles east of Samsoon, the Jekil Irmak, the ancient Iris, pours into the sea nearly as large a body of water as the Kizil Irmak, though after a much shorter course. A little beyond is the Thermodon, now called Termeh, only famous as the spot on which history or fable has placed the female warriors memorable under the name of Amazons. Farther on, a fine wooded ridge, which has formed a vast amphitheatre round the plain of Pontus, approaches the sea at Unieh, the ancient Ænos, a dirty wooden town, most beautifully situated, and carrying on a thriving trade in cotton stuffs, fruit, and wine from the interior. To the east, through a rugged and difficult country, is Keresoun, the ancient Cerasus, a town of 700 houses, with a ruinous aspect; and the Tereboli (Tripolis), about half this size, but in better condition. At length we arrive at Trebisonde, the ancient capital of the Comneni, and the chief emporium of this part of Asia Minor. Xenophon called it Trapezus, from the oblong form which it still retains. The houses are built of stone, but are as usual crowded and gloomy. The lofty ancient ramparts, also built of stone, extend along two deep ravines by which the city is defended; and considerable ruins show the site of the palace. The inhabitants are estimated at about 50,000, consisting of all the races that inhabit Turkey, mixed with the more varied tribes from the Caucasus. They carry on a considerable trade in fruit and wine, and in silk and cotton stuffs of their own manufacture.

3820. *The high and wide expanse of interior Asia Minor*, the most extensive, though by no means the finest or most productive portion, remains to be surveyed. The general character is that of a high bare table land, begirt with lofty ridges of mountains. Being for the most part destitute of trees, it has a naked aspect. Though capable of successful cultivation, the indolence of the natives, and the insecurity of property, prevent the raising of any adequate supply of grain. On the banks of all the rivers, however, are rich pastures, which, with the open country in general, are occupied by the nomadic tribes called Turkmans, or Turcomans, whose habits are almost wholly Tartar. They are subject to little princes, who, according to circumstances, do or do not pay a small tribute to the Porte; and, according to immemorial Scythian usage, combine their pastoral pursuits with that of plundering the unprotected traveller.

3821. *Interior Asia Minor may be divided*, though without any precise demarcation, into two portions, western and eastern. The former comprises the wide range of the ancient Phrygia, with the smaller bordering districts of Galatia on the north and Lycaonia on the south. In modern times it is divided between Anatolia and Caramania, forming the interior of both. The eastern division consists of the ancient Cappadocia, now the Pachalic of Sivas, or Sebaste, reaching almost to the Euphrates.

3822. *The western division contains several large cities.* Kiutayah, reckoned its capital, is situated amid the mountains which give rise to the rivers of Ionia; and the whole country around forms the vast mass of those mountains. Even in its decay, the population, amounting to between 50,000 and 60,000, of whom 10,000 are Armenians, carry on a lucrative trade. The houses are large, built on the model of those of Constantinople; and the streets adorned with many handsome fountains. There are fifty mosques, thirty public baths for the use of the people; and twenty large khans for the reception of travellers. About fifty miles to the north is Eski-shehr, situated on two rivers that fall into the Sikaria. Around it is an extensive arid plain, the same on which Sultan Soliman was defeated by Godfrey of Bouillon. It was the ancient Dorylæum, celebrated for its warm baths, of which an ancient one, adorned with columns of jasper, still remains: it is so hot as to be intolerable for more than two or three minutes. The modern town is of considerable extent, but the houses are poor and ruinous. On the other side, about sixty miles due south from Kiutayah, is *Osium Karahissar*, which D'Anville, on somewhat equivocal grounds, supposed to be the ancient Apamea. It is placed at the western limit of the great chain of Taurus, called here Kalder Dag, and is a large city, containing about 12,000 families, almost entirely Turkish, who are extensively engaged in the manufacture of black felt, and the culture and preparation of opium; both of which form articles of export.

3823. *The great road through Asia Minor runs now in a direction nearly south-east towards the southern coast.* On this route is Ak-shehr (the white city), the ancient Antiochia ad Pisidiam, at the foot of Taurus, whence cold winds blow, and torrents rush down upon the city; yet it contains 1500 houses, is adorned with many beautiful gardens, and with a mosque and college consecrated to the memory of Bajazet. Farther on is Ladik, the ancient Laodicea Combusta; but this is now a poor mud village, presenting only some fragments of marble columns, which the Turks have converted into tombstones.

3824. Proceeding on this route, and approaching the southern line of mountains, the traveller reaches *Konieh*, long one of the grand scenes of Turkish magnificence. It was Iconium, the capital of Lycaonia; but its splendour dates from the period when it became the residence of the powerful and warlike sultans of Roum; which it continued to be till that kingdom sunk beneath the arms of the Tartars. Konieh still displays superb specimens of all the edifices that constitute Turkish grandeur; mosques, colleges, baths, gradually crumbling into ruin. There are twelve large and above 100 small mosques: those of Sultan Selim and Sheik Ibrahim are spacious and magnificent structures; the marble gates also of the Capan

Madressa and other old colleges, richly adorned with fretwork and entablature, afford some of the finest specimens extant of Moorish architecture. The ruins of the ancient Greek city, however, had contributed largely towards its ornament. Among these, Mr. Kinneir remarked a colossal statue of Hercules, which appeared to him fully equal to any ancient sculpture he had ever seen. The modern city, destitute of commerce, is built of wretched brick huts, and is not supposed to contain above 30,000 inhabitants.

3825. *Fifty miles from Konieh*, about midway to the coast, is *Caraman*, which, after the fall of Iconium, became the residence of a chief or sultan of its own name; who reigned over a great extent of the south of Asia Minor, which is still denominated Caramania. It is much inferior in magnificence to Konieh, but carries on a considerable manufacture of coarse blue cotton cloth, and drives a brisk trade with Taurus, Cæsarea, and Smyrna.

3826. *In the heart of Phrygia*, and nearly in the centre of Asia Minor, is a considerable city, *Angora*, the ancient Ancyra, capital of Galatia. The surrounding pachalic consists of a vast plain, abounding in fruits and pasturage, but scantily supplied with grain. It is covered with Turkmans, from whose roving hordes the Porte in vain endeavours to exact even any regular tribute. Their principal chief can muster, it is said, 30,000 horsemen under his banner. The most curious product of this region is the Angora goat, the hair of which rivals silk in fineness. This beautiful animal thrives only within a limited tract to the westward of the Halys, immediately beyond which it degenerates. The city crowns a range of small eminences, one of which, having on its summit the now ruinous castle, resembles the castle rock of Edinburgh, being perpendicular on three of its sides. The foundations and scattered fragments of great ancient edifices may still be traced, but nothing more. Pococke estimated the population at 100,000; Mr. Kinneir at only 20,000. Probably the actual decrease has been considerable; as the present pacha makes a monopoly of the grain, and in various ways oppresses the inhabitants. They still, however, carry on a manufacture of fine camlet, from the goats' hair produced in the neighbourhood.

3827. *The eastern interior of Asia Minor* does not materially differ in its aspect from the western: it consists of wide plains, bare of trees and grain, but rich in pasturage. Subject to its roving tenants, the Turkmans, the frontier districts are also exposed to inroads from the Kurds, a fierce people, whom we shall find in their native seats on the upper Tigris. The people of Cappadocia were considered by the ancients as rude, stupid, and uninformed; but distinguished as rearing a breed of excellent horses: they still retain their reputation in both respects. In modern times this territory bore the name of Roum, or Romyiah, being that given to the kingdom formed by the great Turkish dynasty of the Seljuks; and this name it retains, through the Porte ranks it as the pachalic of Sivas.

3828. *The city of Sivas*, the ancient Sebaste, is a dirty, ill built place; the inhabitants coarse and rude, without any other industry than the old Cappadocian occupation of rearing horses. The finest city in this part of Asia is Tocat, about forty miles to the north-west of Sivas, rising in the form of an amphitheatre round the banks of the Jekil Irmak. Vessels of copper are here made to a great extent, from the mines in the neighbourhood; to which is added the manufacture of blue morocco and of silk stuffs. It is the great channel of the inland commerce of Asia Minor, communicating by caravans with Diarbekir and with Smyrna, and sending others to Bursa and Sinope. These resources support a population of 60,000, among whom, as in all the commercial cities, the Armenians form a large proportion. Proceeding seventy miles in the same direction, the traveller reaches Amasia, romantically situated on the banks of the same river, which here flows in a narrow valley enclosed between rocky mountains. The surrounding country is finely wooded, and produces excellent silk.

3829. *Changing our direction to the south-west*, after a course of eighteen miles we arrive at *Ooscat*, a city raised to celebrity in modern times by the residence of the powerful chief, Paswan Oglu. He long maintained an independent dominion over all the east of Asia Minor, which was greatly improved under his auspices. His palace occupied an immense space in the middle of the town; and though the exterior presented, as usual, only a mass of dead wall, the apartments were richly furnished, and profusely adorned with painting and gilding. The place was then supposed to contain 16,000 inhabitants, chiefly Turks; but since the death of this chief, and the fall of his house, it has probably sustained a considerable diminution. Nearly due south from Ooscat, at the foot of the stupendous and snow-capped mountain of Argish, stands *Kaisarieh*, capital of ancient Cappadocia, and called then Mazaca; but the name was changed to Cæsarea in honour of Tiberius. When sacked by Sapor, it was supposed to contain 400,000 souls. It still flourishes by the product and export of cotton, which occupies within a very narrow circuit a population of 25,000. To the south-east is found Ul Bostan, the ancient Comana, at the very head of the Kizil Irmak, in a finely watered plain covered with trees, and in high cultivation. It has 8000 or 9000 people, and forty flourishing villages under its jurisdiction. The vicinity forms one of the most agreeable spots in Asia, and affords a large quantity of wheat for exportation. To the south, in Upper Cilicia, below Mount Taurus, is Maragh, capital of a small pachalic of the same name, which immediately borders on Syria.

3830. *To complete the picture of Asia Minor*, we have still to survey its *isles*, once celebrated for wealth, beauty, and power, now reduced to a more complete state of desolation than even the continent. *Cyprus*, interposed between Syria and Phenicia, is the most extensive, and was in ancient times the most beautiful, as well as the most voluptuous. It is 140 miles in length, by 63 in breadth. The Cypriotes boast that the produce of every land and climate will flourish on their soil in the highest perfection. Its wheat is of superior quality, and notwithstanding the imperfect cultivation, a good deal is exported. Wine, however, may be considered as the staple product. The grapes contain the richest and most luscious juice of any in the world; and the wines made from them are peculiarly famed for their generous and restorative qualities. They resemble Tokay; but they are disliked by the English as having a sickly sweetness, which only great age can remove. Its fruits also are delicious, particularly the orange and apricot; and game is abundant. All these gifts of nature, however, are rendered abortive by the deplorable system under which the island is at present governed. The inhabitants, two thirds of whom are Greeks, are considered just objects for oppression of every kind. The governor, who resides at Nicosia, is changed every year; and, having obtained his place by purchase, is impelled to indemnify and enrich himself by every form of extortion. Thus, Cyprus, from a fertile and populous island, has been reduced nearly to a desert, not containing more than 60,000 or 70,000 inhabitants, and even these are sensibly diminishing. Such was the case, even before the recent Greek insurrection had afforded the pretext for letting loose upon this unfortunate island a horde of banditti, who exercised on an unresisting people every form of plunder and cruelty. Till then, Cyprus retained still a remnant of what was rich and beautiful in its ancient aspect. Its females still display that finest model of the Grecian form and features, for which they were anciently celebrated. These charms they seek to heighten by artificial and often meretricious decoration; and their conduct often accords but too well with the ancient ideas, which represented Venus as born on this coast, and as choosing Paphos for her favourite shrine. They still carry on the staple Turkish manufactures of leather, carpets, and cotton; all of great excellence, the colours being particularly fine and durable.

3831. *Nicosia*, chief of the cities of Cyprus, is situated in the centre of the island, in a noble plain, bounded by lofty mountains. Its fortifications appeared to Dr. Clarke the grandest he had ever seen; and their extent and solidity, with the domes and minarets rising amid the trees, give it an air of grandeur which, in Mr. Kinneir's apprehension, even Shiraz cannot rival. These fortifications are neglected, and indeed would not now be of much value, since the place is commanded by neighbouring hills. The church of St. Sophia, a very ancient Gothic structure, retains its magnificence; but the palace of Lusignan is almost entirely in ruin. The place contains about four thousand families, of whom half are Christian, divided between the Greek and Maronite churches. They carry on the three manufactures above mentioned, and are also engaged in the collection of medals and other antiquities, of which the neighbourhood is full. *Larnica*, on the southern coast, is the seat of Cypriote commerce, and the residence of the consuls from the different European powers. The ancient harbour is choked up; but the roadstead is good, and there is a considerable traffic carried on with Malta, Egypt, and Smyrna, by Levantine ships under English colours. The inhabitants amount to 3000, chiefly Greeks. A neighbouring cape, still called Chitti, exhibits the ruined fragments of the ancient Citium. Famagosta, the capital, held by the Venetians till it yielded to the arms of Selim, shows its former grandeur by a number of old churches, and by a handsome palace, now partly converted into a mosque. Cerina and Baffo (Paphos), though only villages, are the most agreeable parts of the island, particularly the latter, distinguished by ancient fable as the birthplace and residence of the goddess of love.

3832. *Another island, still more celebrated in antiquity*, and still more completely fallen, is *Rhodes*. It was at an early period renowned as a commercial power; but its existence as a great republic commenced under the successors of Alexander. It then alone asserted that independence which had been lost by the other Grecian states; extended its commerce to the most distant regions; and rivalled the splendour and power of the greatest kings. Demetrius, the first captain of the age, not only exhausted against it all the ordinary resources of war, but invented the *helepolis*, an immense machine, to batter its formidable walls. He was completely baffled, and suffered before Rhodes the wreck of his military fortunes. Even when this island was merged in the Roman empire, her commercial code was adopted by that wise people; and she acquired in after-times a high military glory, when the knights of St. John, expelled from the Holy Land, made Rhodes one of their last retreats, where they long baffled the arms of Mahomet and Solyman. Of all these glories the Turkish sway has obliterated almost every vestige. The city of Rhodes presents no longer a fragment of its colossus, one of the wonders of the world, or any trace of the numerous fine edifices with which it had been adorned by the taste and wealth of its inhabitants. It exhibits only some massy Gothic churches converted into mosques; and contains within about a fourth of its former area a population of about 5000 Turks and 1000 Jews; for, in consequence, probably, of the jealousy inspired by its former obstinate resistance, no Christian is allowed to reside within the walls. The Greeks occupy, however, almost all the remainder of the island, but

are not supposed to exceed 14,000 in number. Rhodes enjoys a delightful climate, the heats being cooled by the lofty mountain of Artemira, which rises in the centre, and is covered with those noble forests of pine, out of which the Rhodian navy was anciently constructed, and which are still conveyed in large quantities to the arsenals at Constantinople. The lower hills still produce a little of that wine, so much celebrated for its delicate perfume by the ancient writers. Industry and cultivation, however, are now nearly extinct, and Rhodes is obliged to import corn from Caramania.

3833. Proceeding in our circuit of the coasts of Asia, we find *Stanco*, the ancient *Cos*, the birth-place of Hippocrates and Apelles, and producing, in abundance, that stone which serves as a whetstone; *Stampalia*, *Amorgo*, *Patmos*, where St. John wrote the Apocalypse. *Samos*, a larger and more important island, which gave birth to Pythagoras, has been always celebrated for its industry, of which striking antique vestiges remain. It has been lately distinguished for its brave stand in the cause of independence, and it is to be regretted that the European states, from local considerations, have assigned it to Turkey.

3834. *Scio* has experienced a very different fate. Nature had rendered this spot almost a paradise. It is calculated by Mr. Turner, that among 150,000 inhabitants, there were not above 400 Turks. *Scio* had become a great centre of that intellectual regeneration at which the Greeks have lately aimed. A college had been established, to which resorted the youth of opulent families from every quarter of Greece, and which could number many eminent professors and scholars. All this prosperity and these fair prospects were in one day destroyed. A landing having been effected by part of the fleet from Hydra and Samos, the Sciotes made a general rising in the cause of liberty. Unfortunately, their habits had been those not only of peace, but of effeminacy; while their shores, unlike those of Samos, presented no barrier against invasion. They were unable, therefore, either to stop or resist the hordes of Asia, who poured across the narrow strait which separates *Scio* from the continent. The immediate consequence was, not a fight, but a dreadful and general massacre; the unfortunate Sciotes fleeing for shelter to the ships or to the rocky caves in the interior. Only a few escaped; 25,000 are supposed to have perished. For the survivors was reserved a fate, if possible, worse than death; the whole, including opulent citizens and ladies of high rank, being bound, and put on board the ships, to be sold as slaves in the markets of Smyrna; and *Scio* became at once a desert.

3835. *Mitylene*, the ancient Lesbos, of voluptuous and poetic fame, the country of Sappho and Alcæus, in later times gave birth to that daring piratical chief Barbarossa. At present it is in great decay, though still supporting a population of 40,000, half of whom are Greeks. These it maintains by the trade in oil, of which are exported 50,000 quintals, not, however, of very superior quality. *Tenedos* is a small rocky island, chiefly memorable from the position in which it stands with regard to the plain of Troy. It derives also some maritime importance from its proximity to the entrance of the Dardanelles; and it produces a wine more highly esteemed than any other in the Archipelago.

SUBJECT. 4. *Provinces on the Euphrates.*

3836. *The provinces on the Euphrates* have been one of the least secure appendages of the Turkish empire. Besides forming a sort of debatable ground with Persia, and beset on all sides by fierce and independent tribes, they have presented, in their remoteness and the difficulties of approach, a strong incentive for the usual ambition of the pachas to assume independent power. Although they possess a still greater name in history than the more western divisions, they do not attest it by the same magnificent monuments. No Greek or Roman kingdom ever possessed such a firm hold of this region as to rear on it structures marked by that high architecture and those durable materials which elsewhere excite the admiration of the world. The palaces of Nineveh, of Babylon, and of Bagdad, were composed of earth and brick, and have crumbled into dust. Nature, however, retains all her grandeur and original fertility, and presents her features of mountain, river, and plain, on a vaster scale, though not, perhaps, under such happy and beautiful combinations, as on the shores of Syria and Ionia.

3837. *We need scarcely name the great empires*, which established their seat in the plain between the Tigris and the Euphrates. *Nineveh*, the earliest, and *Babylon*, perhaps the most splendid in history, erected here their vast capitals, and endeavoured to reduce the world to subjection. They did not, however, nearly equal the extent of that established by the caliphs of Bagdad, which during its brief existence connected the remotest extremities of Africa, Asia, and Europe. Internal dissension, and the tide of Turkish and Tartar invasion had reduced it to a mere shadow, before Holaku made himself master of Bagdad. This event extinguished the lustre of this region as a seat of empire and power, and converted it into a mere frontier and provincial district, in a great measure laid waste and neglected. It has since been viewed by the contending powers of Persia and Turkey rather as an outer bulwark of their respective dominions, than an integral or valuable portion of them.

3838. *In commencing our survey of this region*, we shall begin at its summit, — *Armenia*. This is one of the most ancient kingdoms of Asia, and has almost always maintained a respectable and even independent rank. Though on the route, as it were, of all the great conquering

potentates, its inaccessible site prevented it from being entirely absorbed by any one of them. They merely passed by, demanding tribute and military aid, and allowed it to be governed by its native kings. Only once, under Tigranes, Armenia came forward as a conquering power, and its career might have been prolonged, had it not encountered the disciplined legions of Rome, led by Lucullus and Pompey, who soon reduced it to the rank of their humblest tributaries. When Parthia set bounds, however, to the Roman arms, her rivalry enabled Armenia again to rear its head; and amid all the subsequent revolutions, it preserved a native government, until it was finally reduced into a pachalic by the Turkish power. A part, however, was severed, and appropriated by Persia.

3839. *Armenia*, notwithstanding its fallen political situation, still encloses between its rugged mountains, cultivated valleys and even large cities. Erzeroum, which ranks as the capital, is situated on one of its highest points. The climate in winter is intensely cold: snow begins to fall in August; and covers the ground from October to March. Erzeroum however, is exceedingly healthy, and the country round it fertile; yet Major Sutherland has perhaps over-rated the population at 100,000, of which 15,000 are said to be Armenians, and the rest Turks. About eighteen miles distant is *Hassan Kela*, a small town defended by the strongest castle in Armenia. *Khars*, to the north, is a large town, fortified under Amurath III. and contiguous both to the Russian and Persian frontier; but the present pacha has attached himself in a great measure to the interest of the latter power. *Akiska*, which touches on the frontier of Georgia, and Imiretta, stand on the Kur, in the midst of a fine arable district. The latter is an open populous town, of considerable trade.

3840. *Proceeding southwards along the foot of Ararat*, we come to the fine city of *Bayazid*, the inhabitants of which are reported to be the most warlike and most learned of all the Armenians. It is adorned with a splendid and celebrated monastery, and is supposed to contain 30,000 souls. To the west is *Van*, noted as one of the bulwarks of the empire in its contests with Persia. Its situation is so strong as to be accessible only by a narrow passage, admitting two persons abreast; and it is carefully fortified, in the Oriental style, with a strong wall and a deep ditch. The surrounding country is equally beautiful and fertile; and at two miles' distance is the great lake bearing the same name, 168 miles in circumference, but the water of which is too brackish for use.

3841. On a lower level than the region now described is the *pachalic and territory of Diarbekir*. It forms a high table-land, about 120 miles long, between the Euphrates and the Tigris. Its surface is rugged, but interspersed with numerous valleys, that are highly picturesque, beautiful, and fertile. The city of Diarbekir is the ancient Amida, a bulwark of the Eastern Empire against the Parthians. Its wall of black stone, the work of the Romans, though now neglected and ruinous, was considered by Mr. Kinneir as superior, for height and solidity, to any he had ever seen in Europe or Asia. This wall, with the towers, and the minarets peering above, gives to the city a peculiarly grand and imposing aspect. It contains 38,000 inhabitants, and from its situation on the high road between Persia and Turkey, as well as on the communication down the rivers, forms a sort of key to the commerce of Western Asia. On the northern extremity is *Maden*, a town situated in the very heart of Mount Taurus, and surrounded by lofty ridges of bleak and barren mountains, through a prodigious chasm in which the Tigris is seen dashing. These mountains, however, are rich in metallic wealth, from which Maden derives its importance. They produce abundance of excellent copper, some iron, and even a little gold and silver.

3842. Crossing now to the eastern bank of the Tigris, we find ourselves in the *rude mountainous region of Koordistan*, occupied by the proudest, fiercest, and most predatory race of all who infest the Turkish dominions. They inhabit castles rather than cities; but Betlis, on the northern frontier, forms a sort of capital. This city is built on a number of narrow ravines, branching out from a perpendicular rock in the centre, on which the castle is erected. The streets are steep, but the houses are well built of hewn stone, surrounded by gardens, and each so constructed as to form a sort of petty fortress. The city is well supplied with fruits and provisions; but few merchants venture on the perilous tracts which lead to and from this mountain capital. Although Betlis is nominally included in the pachalic of Moosh, the real power is possessed by the Khan of the Koords, the descendent of a long line of feudal princes. About fifty miles to the south is Sert, the ancient Tigranocerta, so named from Tigranes, who made it the capital of his short-lived empire. At present Sert is a large mountain village, where each house is a castle, surrounded by a wall, and even a moat. These chiefs resemble the ancient heads of the Scottish clans: they possess the power of life and death over their vassals, whom, however, they treat with kindness and familiarity, and are regarded with reverence and affection. They feel unbounded pride in their pedigree, which they trace back to the age of Noah, cherish a rooted attachment to their native soil, and a hatred of strangers, towards whom they observe neither faith nor humanity.

3843. *Immediately to the west of Betlis is Moosh*, the town of which name has been made by the Turks the residence of a pacha. It is poor and ill built; but the district contains many fertile spots and large villages, cultivated and inhabited by the industrious Armenians. To the south-west of Diarbekir, on the banks of the Upper Euphrates, is found the small

pachalic of *Orfa*, marked by a gradual transition from the mountainous part of Armenia to the sands of the Syrian desert. Its capital occupies the site of the ancient Edessa, a city of some fame, both under the successors of Alexander, and afterwards when the arms of the crusaders placed over it one of the Courtenays, to whom it gave the title of *count*. It is said to be still well built, with a magnificent mosque consecrated to Abraham, and a population of 20,000 souls. A village inhabited by Arabs still bears the name and site of Harran, the original abode of the patriarch. Other places of some importance on the bank of the Euphrates are Racca, the ancient Nicephorium, a favourite residence of Haroun al Raschid; Bir, or Beer, where the passage of the river by the caravans is facilitated by a bridge of boats; Koum Kala, the ancient Zeugnia, a small castle and fort, formerly the great Roman military passage.

3844. Descending from these heights, we come to the great plain between the two rivers called at present *Algezira*, and by the ancients *Assyria* and *Mesopotamia*. Though partly rocky and sandy, it is in general capable of being rendered productive; but being in many places occupied by the Arabs, and in others exposed to the inroads of the Kurds, less cultivation is bestowed upon it than on the mountain valleys to the north. Mosul, the capital, is a large, ancient, gloomy-looking town, in a state of sensible decline. It contains about 35,000 inhabitants, with the remains of some fine Arabic structures; and carries on a little trade. On the opposite or western side of the Tigris, the village of Nunia appears to occupy a part of the vast circuit of the ancient Nineveh. The only monuments are mounds of earth, nearly a mile in circumference, similar to those of Babylon, though not nearly so lofty or so perfect. A rampart may still be traced some miles in circumference, surrounded by a fosse, and covered with grass, which gives it the appearance of one of the old Roman entrenchments. On a vast plain to the east was fought the battle of Arbela, in which the fate of the Persian empire was finally decided. Mosul, with a territory of two miles round it, has been formed into a pachalic by itself.

3845. All the rest of this country is included in the pachalic of Bagdad, the upper part of which, touching on Diarbekir, retains still the mountainous character of that province. The most northern town is Merdin, the old Roman position of Mardis, the walls of which are still in tolerable repair. The houses, which are rather well built, rise in ranges above each other, along the declivity on which the city is built, and which forms a branch of the great chain of Mount Masius. About thirty miles to the south appear the towers and ramparts of Dara, the deep foundations of which may be traced for more than two miles. The southern gate is ten feet in thickness and sixty in height, and some fragments of ancient architecture are scattered over the site, which is now occupied only by a few detached families, attracted by the abundance of water. But of all this chain of mighty fortresses, none equalled the strength of Nisibis, which stood always impregnable against the Parthians, till it was ceded to them by treaty; after which the Romans attempted in vain to recover it. Only the foundations of the walls can be traced for about three miles. The interior is filled with hillocks of stone and rubbish, amid which appear the black tents of the Koords and Arabs. On the Euphrates, opposite to Mosul, are only a few small towns, on the site, however, of some Roman stations; among which we may remark Kerkesieh, the ancient Circesium, raised to importance by Diocletian; and Annah, a pretty large place, which, being situated at the point where the Desert becomes of less immense breadth, is often a rendezvous of caravans coming up the river and proceeding across to Damascus.

3846. Between Annah on one side, and the ruined fortress of Tekrit on the other, the rivers approach to within fifty, and sometimes twenty-five miles of each other, enclosing between them that magnificent plain called, successively, *Babylon*, *Chaldea*, *Mesopotamia*, and now *Irak Arabi*. As it is completely a flat surface, and the waters of the Tigris and Euphrates, during the wet season, rise to a level with it, the irrigation of the whole region is practicable, and during its prosperous era was completely effected. Hence arose an extensive and luxuriant fertility, which was rivalled only by the Delta of Egypt, and rendered it the early seat of wealth and civilisation. Even under Persian dominion a tribute was drawn from it equal to a third of that paid by all the rest of Asia. At present, the luxuriant harvests which once covered this plain have entirely failed, for want of the simple processes necessary to produce them. The inundated banks of the rivers are overgrown with impenetrable brushwood; the interior, deprived of the canals which formerly watered it, is reduced almost to the level of the bordering deserts. "The humble tent of the Arab now occupies the spot formerly adorned with the palaces of kings; and his flocks procure a scanty pittance of food, amid the fallen fragments of ancient magnificence."

3847. Notwithstanding, however, the desolation to which this region is now consigned, the traveller still eagerly seeks in it the trace of those mighty capitals, which, both in the ancient and middle ages, gave to it a lustre unrivalled by any other part of the world. Of these, Bagdad alone retains any actual existence, and is still a large city, the metropolis of the extensive pachalic which bears its name. It exhibits, however, scarcely any remnant of the gay and romantic splendour of the court of the caliphs. Not even a vestige of their palace remains; and the same may be said of most of the costly edifices with which they embellished

Bagdad, when it was the capital of the Mahometan world. The chief monuments of that period are the gates and towers, which, even in decay, far surpass any of modern erection. To these may be added the tomb of Zobeide, with one or two colleges and minarets. Almost all that is modern of Bagdad is mean, and foreign to the ideas which the name excites. The streets are so narrow that two horsemen can scarcely pass; and the bazaars, though containing accommodation for a very extensive trade, are by no means handsomely fitted up. Bagdad, since its capture by Hulaku, in 1258, which finally extinguished the caliphate, has passed through many vicissitudes. Being the greatest of the debateable subjects between the empires of Persia and Turkey, the most strenuous efforts of both were exerted for its possession.

3848. From Bagdad, we proceed by a direct line almost due south to the Euphrates, in search of *Babylon*, a spot to which recollection gives an almost unrivalled interest. Here, over a space extending five or six miles in every direction, are spread the undoubted remains of that ancient "glory of nations," which none of the proud capitals of the ancient world ever rivalled in magnitude and the grandeur of its structures; and which is rendered still more imposing by the awful antiquity to which its origin ascends. It owed its foundation, or at least its splendour to Semiramis, whose era is that of the formation of the first of the great empires. Large additions were made, particularly by Nebuchadnezzar; and Babylon was thus the work of successive ages; but we have now no means of tracing the share taken by each in its erection and embellishment. The walls, according to Herodotus, were sixty miles in circumference, and, by the most moderate reports, at least forty-five. They were 365 feet high, and so broad that six chariots might drive abreast along the top. The form of the city was that of a regular square, with twenty-five gates on each side; and the streets ran in straight lines from gate to gate. Among the structures three were pre-eminent, and ranked among the wonders of the world. One was the palace, eight miles in circumference, enclosed within three successive walls, the interior of which was covered with paintings. Near it was the second wonder, that of the hanging gardens. These were raised, it is said, by Nebuchadnezzar, to gratify a Median spouse, accustomed to the bold scenery of her native country, and disgusted with the tame uniformity of the Babylonian plain. Having undertaken to transport thither the landscapes of her own land, he raised masses of huge extent, supported by arches upon arches, and covered with deep earth, which not only produced plants and flowers, but presented a range of wooded steeps, similar to those in the mountains of Media. Thirdly, the gigantic tower of Babel, or Belus, was a still more celebrated structure, respecting which tradition, fable, and history are strangely blended. Though dedicated by the Babylonian kings to an idolatrous worship, it traces its first origin to a much earlier period, when men, intoxicated by their first successful achievements, formed the daring project of an edifice reaching to the skies. Converted into the shrine of Belus, it was adorned by colossal images and statues of solid gold, the value of which has been rated by Herodotus, doubtless much too high, at 5000 talents, or 21,000,000*l.* sterling. Equally exaggerated has been its reputed height, which some Jewish authorities fix at twelve miles, and even Jerome quotes contemporary authority for its being four miles high. These ridiculous estimates give way before the sober testimony of Strabo, who states the height at a stadium, or 660 English feet, exceeding only a little that of the highest pyramid. Even after the downfall of Babylon as the capital of an empire, it continued to be the most splendid city in Asia. Alexander was strongly attached to it, and, if he had lived, would, perhaps, have made it his residence. The gradations of its utter decay are not distinctly traced by history. It seems to have been slow, as the powers which held sway in this neighbourhood chose other positions in the vicinity for their seats of empire. The kings of Syria chose Seleucia; the Parthians, Ctesiphon; the Saracens, Bagdad; and each, according to the custom of the East, sought to aggrandise his favourite city by transporting to it the inhabitants of Babylon, and the materials out of which it was built. Babylon is at present the scene of utter desolation:—"The wild beasts of the forest lie there; the dragons howl in her pleasant palaces." Yet even now, after so many ages of desolation, and after so many great capitals have been built out of its ruins, enough remains to attest the fidelity of those who described it as the greatest capital of the ancient world; "the glory of kingdoms, the beauty of the Chaldees' excellency." Its mighty structures, indeed, are resolved nearly into their original elements: instead of walls and towers, we see only confused heaps of earth, bricks, and rubbish; but these are piled almost in mountain masses; and, seen afar along the Mesopotamian plain, proclaim still the wonders of a distant age. Mr. Rich, in his careful survey, has described four remarkable masses, which cannot, however, without some difficulty, be traced to the ancient structures. The first is a large mound, called by the modern inhabitants the mound of Amran, 1100 yards in length, 800 in breadth, and from 50 to 60 feet in height. Its great extent and loose texture seem, with great probability, to suggest the idea of its being the remains of the hanging gardens. After crossing a valley somewhat more than a quarter of a mile in width, he came to another pile forming a square of about 700 yards, evidently the site of a finer and more elaborate structure. Several walls were entire, built of the finest brick, cemented with lime, ornamented with niches, and with some remains of painting and sculpture. The natives called it the *Kasr*, or palace, and its

appearance seemed strongly to warrant that appellation. About a mile to the north is another, called the *Mujelibe*, whose sides are only 219 by 136 feet in length and breadth; but its elevation is 141 feet, greater than that of those just named. The summit is strewn with various fragments, and the interior contains many cavities, tenanted by wild beasts, bats, and owls. From two of them Mr. Rich extracted wooden coffins containing skeletons in high preservation; and he was of opinion that a considerable proportion of this structure would, upon search, be found similarly filled. These relics indicate a royal cemetery, of which several, particularly that of Ninus, are mentioned by historians. Mr. Rich and some other travellers have considered it as the tower of Belus, or Babel. But there is another mass, of vaster dimensions, about ten miles distant, more strongly assimilating with the aspect which we should conceive that famous structure to present. It is of an oblong form, 762 yards in circuit, and rises to the height of 192 feet. The bricks are of the finest description, and cemented with lime so closely, that it is nearly impossible to extract one entire. It has some appearance of having been built in stages, and on its summit there is a solid pile of brick thirty-seven feet high, diminishing in thickness to the top. In short, it is in all respects the greatest monument of Babylon, and would have unquestionably corresponded to the most remarkable edifice of that city but for its great distance from the other remains, which causes a doubt how it could have been comprehended even within the vast limits of Babylon. Yet, when we consider how immense these were, suggesting the idea of a fortified territory rather than that of a city, it seems scarcely sufficient to outweigh so striking an accordance in other respects, especially as there is no record of any such extraordinary structure situated without the walls of Babylon.

3849. Adjoining to this remarkable scene is the *modern town of Hillah*, built on both sides of the Euphrates. It contains 12,000 inhabitants, has several stately caravanseras of Babylonian brick, well regulated markets, and carries on a considerable trade, both with Bassora and the districts higher up the river.

3850. Returning to Bagdad, and proceeding down the Tigris, we find, about eighteen miles below, the ruins of two great capitals, which had been built out of those of Babylon: *Ctesiphon*, by the Persians, on the east side; and *Seleucia*, by the Syrian kings, on the west. Of Seleucia, only the walls and ramparts are now discoverable; but Ctesiphon still presents the outline of the *Tauk Kesra*, a palace of Chosroes, the richness and beauty of which have been a favourite theme of Oriental history and romance. It contains in the interior a vaulted hall, which rises to the height of 106 feet, and its lofty walls are seen from far along the plain.

3851. *The banks of the Tigris, down to its junction*, cannot boast a single village; but *to the west of the Euphrates*, and even in the desert, occur several remarkable places. *Meshed Ali* was founded by Alexander; but its fame in the East rests on its being, as its name imports, the tomb of Ali, the great Mahometan prophet. This tomb forms a handsome structure in the centre of the city; and infidels are forbidden on pain of death to enter its walls. An elegant dome which surrounds it was gilded by order of Nadir Shah. It is supported by a constant influx of pilgrims, and by the number of Persians of rank, whose bodies are transported from the most distant quarters to be interred in this holy ground. Between Meshed Ali and the river is Koufa, a place of such antiquity, that from it the Arabic characters have been termed Koufic, or Cufic. It was enlarged by Omar, who made it the residence of the caliphs; but after the transference to Bagdad it fell soon into decay. At present there remains little more than the mosque where Ali was assassinated; a plain building, which the Mahometans, however, hold in peculiar veneration. Both banks of the Euphrates are here possessed by Arab tribes, among whom the most powerful is that of Montefidge, which can bring four thousand horse into the field. Among them are some of the finest specimens of the Arabian breed.

3852. *The Euphrates and the Tigris*, after having for so long a space enclosed this majestic plain in their parallel course, unite a little below the village of Korna. The combined stream receives the name of *Shat-ul-Arab*, and presents still some remnant of the fertility of the plain of Babylon, its banks abounding with grain, dates, and a variety of other fruits.

3853. On this branch is situated *Bassora*, or *Bussora*, a great city, which absorbs nearly all the foreign commerce of Persia and the Euphrates. It is seven miles in circumference, a great part of which space is laid out in gardens and plantations; and intersected by canals navigable for small vessels. Its most important trade, being that with India, is carried on partly by British, but chiefly by Arabian vessels, of which those of 500 tons burden can ascend the river to this point. The inhabitants are estimated at 60,000; a heterogeneous mixture of Arabs, Turks, Indians, Persians, and all the people of the East. They have not expended much of their wealth in the embellishment of the city, which is dirty in the extreme. The houses are meanly built of brick; the bazaars are wholly unsuitable to the valuable merchandise deposited in them; and there is only one mosque which has a decent appearance.

CHAP. III.

ARABIA.

3854. *Arabia* forms an extensive country, or rather region, of Asia. It is a peninsula comprising nearly the whole south-west portion of that great quarter of the globe.

SECT. I. *General Outline and Aspect.*

3855. *The boundaries of Arabia are*, on the west, the Red Sea, called also the Arabian Gulf, which separates it from the opposite coast of Africa. On the south it has the Indian Ocean, part of which separates it from Berbera. As the coast changes its direction, it has still for some time this ocean on the east, opposite to the distant shores of Malabar; but this great sea is soon narrowed into the Persian Gulf, which divides Arabia from the south of Persia. A line drawn from the head of the Persian Gulf to the head of the Arabian Gulf would seem the natural boundary of Arabia, were it not for the vast desert which stretches to the northward, and is of a character so decidedly Arabian, that it has always been referred to that part of Asia. This wilderness forms a gulf, as it were, between two of the finest portions of the continent,—Syria and Palestine, on the west; and the once great empires of Babylon and Assyria, now sunk into the Turkish pachalic of Bagdad, on the east. This tract of Arabia, continually narrowing to the northward, is finally closed at an angle, as it were, by the lofty mountain heads of the Euphrates and the Tigris.

3856. *The boundaries of this vast region are* somewhat imperfectly defined, especially towards the north; but if we close it, as seems reasonable, about Palmyra and Anna, we shall then have a length from north to south of 22° , or somewhat more than 1500 miles. The greatest breadth across from Mecca is not less than 20° , or 1200 miles; but this is narrowed by the Persian Gulf to little more than half that dimension, and gradually diminishes to the northward. With these dimensions, under such a climate, and in a position so central, Arabia would have been the finest country of Asia; had it possessed one essential element, that of water. Deprived of this, it has, for the most part, ever borne the character of *desert*, for which its very name has become proverbial. There are, however, some brilliant exceptions, particularly the country of Yemen, which has been called the Happy Arabia; but in general, over all the vast expanse, naked rocks and arid sands predominate.

3857. *The privation of water*, whence the barrenness of Arabia arises, is incident to all countries under the torrid zone in which moisture is not collected by great ranges of *mountains*. Lofty chains, like those of Ararat and Imaus, seem necessary to pour down those mighty streams that fertilise the burning plains of Asia. Arabia is not, indeed, destitute of tracts that have a mountainous character; but these present, in general, only long rocky ridges, whose scanty streams are quickly absorbed in the surrounding waste. Sinai and Horeb, towering over the head of the Red Sea, and rendered famous by great events, form, probably, the most elevated portion. In the Hedjaz, however, the country round Mecca and Medina, are found the Ramleah mountains, and other chains, whose aspect suggested to the ancients the name of the Stony Arabia. Another continuous chain of the same character appears to cross the whole of the Nedsjed, or central district. Between these stony ridges are interspersed what are called *wadis*, narrow watered valleys, which a degree of vegetation, sometimes even brilliant, distinguishes from the surrounding waste. Yemen, the *Arabia Felix* of the ancients, presents an aspect still more favourable. Along the whole of the Red Sea, indeed, extends a belt, called the Tehâma, of the most absolute and dreary barrenness. But behind this Yemen rises, not into the naked rocks of the interior, but into variegated hills, covered with some of the finest aromatic shrubs. Yet even this tract, though distinguished for beauty, is fertile by contrast, and cannot vie with the luxuriant plains of other Oriental countries.

3858. In all Arabia scarcely a *river* can be said to exist. Torrents alone are seen dashing down the rocks; and, after diffusing verdure over a valley of small extent, are absorbed in the sand. They seem never so copious as to form any thing that can properly be called a *lake*.

SECT. II. *Natural Geography.*SUBSECT. 1. *Geology.*

3859. The reader is referred to the remarks under Chap. I. Sect. II. antè, p. 854.

SUBSECT. 2. *Botany.*

3860. The general nature of the vegetation of this country may be at once surmised from the name of its two great divisions, *Arabia Petræa*, and *Arabia Deserta*. A third portion is the Yemen, or *Arabia Felix*, so called on account of its comparative fertility.

Another reason assigned for the name of *Happy* being given, is, that from this district were introduced, by way of Egypt, into Europe, so many precious spices, as spikenard, cinnamon, cassia, cardamoms, pepper, &c., which were supposed to be natives of the country, though the Arabs are now well known to have themselves imported them from the East Indies. Forskāl, however, who has published a flora of this particular district, tells us that an almost continual drought and a too serene sky grievously injure the soil, and render it unfit for cultivation. To this evil may be added whole armies of locusts ("the daughters of heat"), which every where devour the herbage; graminivorous birds, which are the pest of the corn-fields; and inundations of the sea, that impregnate the fields with salt, and destroy their fertility. Cryptogamic Plants are almost wholly wanting; the Grasses cannot bear a comparison with those of the north, and Junci and Carices are almost unknown. Littoral plants occupy the shore in a sandy or argillaceous soil. Campestral Plants (*Campestres*) abound more as you approach the mountains and under the shade of trees, and exist in society. There are perennial pastures, yielding *Holcus* and *Panicum dichotomum*. The *Phaseolus* is alone sown for fodder, as the *Trifolium alexandrinum* is in Egypt. The camel, when he enters the woods, luxuriates on Cucurbitaceous and Climbing Plants.

3861. *The Cerealia are not confined to the plains*, but they extend to the mountains; art assisting nature in the formation of hanging gardens and fields, these being supported by walls and earth carried thither. Coffee, esculent plants, and the *Cerealia*, are planted, especially Wheat. These amphitheatres of fields, supplied with water by cisterns, afford an extraordinary and novel spectacle to the traveller. In the plains the *Holcus Durra* (*H. Sorghum*) is almost the only bread-corn cultivated. Of this there are three harvests in the year; two months and a half sufficing to bring the grain to maturity. The first crop is sowed by the natives, the two next spring up spontaneously; but the grain can only be secured by keeping up a constant noise, and a perpetual watch, to drive away the birds.

3862. *The forests are confined to the mountains and adjacent valleys*. In all Tehâma (a district which occupies almost all the land between the mountains and the sea) there are none except at Surdud. These mountain-trees, though exposed to the most powerful winds, grow straight and lofty: they consist of various species of Fig, of which Forskāl enumerates no less than eight; Sceura, Keura odorifera, a superb tree, like a palm, but without a spatha, much prized on account of the delicious odour it exhales, one spike alone sufficing to perfume a whole apartment for a long time, if placed in a rather moist situation; *Tomex glabra*; *Cynanchium arboreum*; Catha, a tree also cultivated in the gardens along with the Coffee, the Arabs eating the leaves on account of their many virtues: no plague can come near the dwelling where this is cultivated, nor any infectious disease attack a person who carries a branch of this tree in his bosom; and Mœrua, besides some unknown species. Palms inhabit the sandy plains of Tehâma.

3863. *The gardens of this country contain little more than esculent, odoriferous, and dyeing plants*. Thus much M. Forskāl.

3864. *Rather than attempt an account of the distribution of the vegetable productions of Arabia*, of which so little is known, we shall content ourselves with noticing some few of the plants which are most valuable in the arts or in commerce, and in a greater or less degree peculiar to the country. And in the first rank will undoubtedly stand the

3865. *Coffee* (fig. 570.), of which Arabia Felix, if not the native country, is the favoured spot where this shrub arrives at the greatest perfection. It is a production of the highest

570

COFFEE PLANT.

value. Some say it is a native of Upper Ethiopia, whence it was introduced to Arabia; others consider it an aboriginal of Yemen. Bruce maintains that it grows spontaneously in Abyssinia, being found wild in the greatest abundance from Caffa to the banks of the Nile. In that country, indeed, it has been considered to be cultivated from time immemorial; and the same author tells us that the Gailæ, a wandering tribe of Africans, in their incursions into Abyssinia, being obliged to traverse immense deserts, carry with them nothing to eat but coffee, roasted till it can be pulverised, and then mixed to a consistency that will permit of its being rolled up in balls and put into a leathern bag. One of these, about the size of a billiard-ball, keeps them, they say, in strength and spirits during a whole day's fatigue, better than a loaf of bread or a meal of meat. Be this as it may, it is from Arabia that Europe first became acquainted with coffee; and it is from Arabia that the islands of the East and the islands of the West have derived

it, where it is, perhaps, cultivated to a much greater extent than in Arabia itself. We can, at best, form but a very incorrect idea of the quantity of coffee grown, from that which is exported to Europe: for all Arabia yields to Europe annually only 1,500,000 lbs. weight; while St. Domingo has in one year exported 71,665,187 lbs., Surinam 15,387,000

lbs. ; and other American islands, and even Persia, and Suez, have greatly exceeded in export the quantity derived from Arabia. The plant grows to the height of forty or fifty feet, with a stem four or five inches in diameter. Its copious evergreen foliage, white flowers, and red berries, are too well known in the stoves of our own country to need description.

3866. *The Mocha Coffee*, as the seeds of the berry cultivated in Arabia are called, is distinguished from the coffee of other countries by the roundness and smallness of the grain ; the reason for which is, that one out of the two seeds in the berry is abortive, and the other assumes a rounded form, for want of the mutual pressure that would otherwise have been given. The superior quality depends partly on the time and manner of gathering the Mocha coffee, and still more, perhaps, on the soil and site chosen for the cultivation of the plants. The best sort is grown on the mountains of Hadje, about sixteen miles east of Beit-el-fakieh, a spot, of which, besides an execrable plate, we have a description in the first volume of *Voyage en Arabie*, by Niebuhr. "My travelling companions," says he, "whom I had expected to find at Hadje, were in the gardens on the mountain where the coffee grows. I followed them thither the next day, taking a nearly east-south-east direction, towards Kusma ; and I overtook them at Bulgose, one of the villages which principally depend for subsistence on the culture of coffee. Neither asses nor mules can be used in climbing these mountains : it is necessary to ascend the steep places by a road, which, being only mended at wide intervals, is extremely bad. To me, however, who had just quitted the arid and sandy plains of Tehâma, where I had been accustomed to walking, it appeared delightful, as I was surrounded on all sides by gardens, which formed the principal plantations of coffee.

3867. "It was only near Kahhme that I had seen a single small hill of those long and pentagonal stones that I have formerly described ; but here a great portion of the mountain seemed to consist of this sort of stone ; the detached rocks, likewise composed of it, presented a striking appearance, especially where water was trickling from the summit of the rocks, and formed cascades which appeared as if supported on little upright columns. It is easy to detach these stones from the rocks, and they are used to make steps on the road, as well as for the walls with which it is needful to prop up the gardens where the coffee is grown, on the slope of the mountains ; from which it appears that these stones are very serviceable to the inhabitants of this hilly country.

3868. "The tree that produces coffee is well known in Europe. It was covered with flowers near Bulgose, which diffused an agreeable scent. All the gardens are situated on platforms, one above another. Some are only watered by rain : in others there are large reservoirs (*Birket*) on the higher parts, whence the running water is conducted and distributed over all the beds, where the trees are generally grown so close together, that the sun cannot make its way between them. We were told that the trees, thus artificially irrigated, bore fruit twice a year : but that the beans ripened only once ; those of the second crop, which did not attain to complete maturity, being inferior to the first."

3869. *Balsam, Frankincense, and Myrrh, Gum, Aloes, Senna, and Tamarinds*, are other staple commodities of Arabia, that have given the country a name and a rank among commercial nations. The Balsam (*Amyris Opobalsamum* or *gileadensis*, perhaps both one and the other) has already been noticed when treating of Palestine ; it being generally supposed to have been introduced from Arabia to Mount Gilead. Frankincense is the produce of *Juniperus lycia* (which, however, does not appear to be a native of Arabia), — and was extensively employed in their sacrifices by the Hebrews, who obtained the best from Arabia, as do the Roman catholics at the present day for their incense. According to Niebuhr, the plant affording it is chiefly cultivated on the S. E. coast of Arabia, and is there called Liban or Oliban. Yet, on the authority of a paper in the *Asiatic Researches* by Mr.

571

ACACIA ARABICA.

Colebrooke, the true Olibanum is the gum of an East Indian plant, the *Boswellia serrata* of Dr. Roxburgh, and the frankincense it yields was very likely to be imported by the Arabians, and thence sent to different countries.

3870. *Myrrh* is a gum-resin which is supposed to exude from the *Amyris Kataf* of Forskål. Gum-arabic, as it is called, is produced by *Acacia arabica* (fig. 571.), (of which an excellent figure is given by Dr. Roxburgh), and probably many other individuals of the same genus.

3871. *Of the Aloes*, the Aloe

572

ALOE SOCCOTRINA.

officinalis of Forskäl is mentioned by that author as the species which affords the famous East Indian Aloes, called Soccotrine Aloes: the same, probably, as the Aloe Soccotrina (fig. 572.) of De Candolle, and a native of the island of Socotra, at the mouth of the Red Sea. Perhaps the same species exists in Africa. In the presence of six species of this genus as mentioned by Forskäl, of several Stapelias, and some Mesembryanthema, Arabia has some affinity in its vegetation to that of the Cape of Good Hope.

3872. *The Arabian physicians* first made known the valuable properties of Senna as a medicine, and the Senna of Arabia is the foliage of *Cassia lanceolata* of Forskäl.

3873. *Tamarinds* are the fruit of *Tamarindus officinalis*, a beautiful tree, now cultivated in all the hot parts of the world, on account of the valuable nature of the fruit.

3874. *The fruits* of temperate and warmer climates are equally grown in Arabia. Gourds and Melons, Cocoa-nuts, Pomegranates, Dates, Apricots, Peaches, Almonds, Filberts, Pears, Figs, Oranges and Lemons, and even the Mangosteen.

SUBSECT. 2. Zoology.

3875. *The Zoology of Arabia* is nearly of a similar character to that of Northern Africa and Caspian Russia; nor is it possible, with our present knowledge, to detect the slight variations in the productions of countries artificially separated by man. Arabia, in common with the whole extent of Northern Africa, Persia, and Western India, possesses the Camel and the Dromedary, to which travellers also add Lynxes, Jackals, Hyenas, Monkeys, Jerboas, and various Panthers. Information so desultory and vague is of little value, as leading to no correct knowledge of the particular species intended.

3876. *The Arabian horses* (fig. 573.) are well known to be the finest in the world; but the

ARABIAN HORSE.

idea that they are found wild in the deserts, as asserted by the old writers, is now justly exploded. Major Smith is of opinion that this noble animal was aboriginal in Great Tartary. In no country is he more esteemed, or are his faculties in consequence more developed, than in Arabia. The wandering Arab of the desert places his highest felicity in his horses, and is so attached to them, that they are more his companions than his servants. It is by these tribes that nearly all the horses are bred; and they are known under two denominations. *Kadeschi* are horses of an unknown race, and *kochlani*, those whose genealogy is known for 2000 years: this race, they assert, originated from the stalls of Solomon. To establish the genealogy of a *kochlani*, the most rigorous vigilance is employed, and such formalities and certificates required, as defeat all attempts at imposition. The horses of this noble race are sold at enormous prices, but no consideration whatever will induce the Arabs to part with the mares. An Arabian will generally carry his master from eighteen to twenty leagues in the day. They perspire little, and possess in the most eminent degree the qualities of endurance, vigour, and admirable temper.

3877. *Locusts in vast numbers*, and of different species, periodically devastate this and the neighbouring regions of Africa, from whence they have emigrated, at distant intervals, to Sicily and the south-eastern shores of Europe.

SECT. III. Historical Geography.

3878. *In taking a retrospective view of former periods of Arabian history*, we find reason for surprise at the little change that has taken place in the social life and manners of the people. By the aid of scripture, we are enabled to ascend to a period long anterior to the commencement of ordinary record; and in the patriarchal ages, we find a mode of existence precisely similar to that of a modern Arabian sheik. In the Ishmaelites and Midianites, on the borders of the desert, we find the same combination of plunder and traffic which has ever since formed the occupation of their countrymen. The borders of the desert, however, where it merges into the fertile territory, became ultimately the seat of several demi-Arabian states, which attained to considerable power and even opulence. Foremost among these were Ammon, Moab, and Edom or Idumea; countries which, besides their other advantages, appear to have been enriched by a portion of the transit trade with India. The most brilliant and distinguished part of Arabia, however, was that designated "the Happy," and called Sabæa, and in scripture Sheba. Adding to its own productions the myrrh and balsams of the opposite coast of Berbera, it seems also to have been a depôt for the gold, spices, and other precious commodities of India and tropical Africa, which appear even to have been often considered by the ancients as its native products. The Arabs, indeed, of this and of the eastern coast of Ommon appear to have always been the most active mercantile navigators of the Eastern seas.

3879. *Thus, during the whole of that long era which belongs to ancient history, Arabia preserved its interior pastoral state, while its relations with foreign nations were confined to commerce and to petty marauding. It also preserved its independence unaffected by those great events which changed the fate of the surrounding nations. It was not until the sixth century of the Christian era, that, after a singular revolution, it came forth with a mighty sweep to change the destinies of the world. The decline of the Roman empire, the corruption and distractions of the Eastern church, all favoured the impulse given by a fierce and warlike fanaticism.*

3880. *Mahomet, after being for years an exile and a fugitive, at length succeeded in uniting under his standard all the nomadic and warlike tribes of central Arabia. In less than fifty years, that standard waved triumphant from the Straits of Gibraltar to the hitherto unconquered regions beyond the Oxus. Wherever it came, it stamped on mankind a new character, — dark, gloomy, severe, — combining a hard austerity with a voluptuous indulgence, and, except in some transient instances, hostile to all the improvements of art and science. The caliphs who first succeeded Mahomet, and ruled the most extensive empire on the globe, still retained the rude simplicity of the Arab pastoral life, with the ascetic self-denial of saints and religious teachers. The messenger who brought to Omar the tidings of the capture of Alexandria found him sleeping among the beggars on the steps of the temple of Mecca. The wealth, however, which flowed in from every quarter soon produced their usual effect of exciting a taste for pomp and pleasure. The court of the caliph acquired an almost magic splendour; while poetry and the sciences, regarded with contempt and horror by the earliest of these militant apostles, were raised to the highest pitch under the patronage of Haroun Al Raschid and Almamoun. By that time, however, the rude rocks and desert sands of Arabia had ceased to be regarded as a fit residence for the opulent commanders of the faithful. They had transferred their residence to Bagdad, within the old and favourite seat of empire, on the rich Mesopotamian plain. Thus left to herself, Arabia seems to have resumed her natural and original character, even long before the court of Bagdad had been swept away by the torrent of Tartar invasion.*

3881. *Arabia was thus again detached from other countries, and restored to her pristine state of rude and roving freedom. Her coast, however, suffered severely from the extended domination of the Turks, who two centuries ago had occupied its eastern ports as far as Mocha, and established a system destructive of the commercial prosperity which they had so long enjoyed. The decline of that empire, first felt in its extremities, enabled the Arabian sheiks to regain their independence.*

3882. *A fresh fermentation, similar to the former, during the last century agitated the interior of Arabia. A prophet of obscure birth, Abdul Wahab, appeared, about 1720, and drew numerous followers. His first aim seems to have been to effect a reform in the Mahometan religion, to remove the traditions which had been grafted upon it, and to prevent divine honours from being paid to any human object, even to Mahomet. Ultimately, perhaps, he has only, by becoming a prophet himself, added one to its superstitions. He does not appear in the first instance to have contemplated the diffusion of his tenets by force. But Ibn Saoud or Sehoud, a young and warlike prince, inspired either by religious proselytism or political ambition, not only espoused the Wahabite tenets, but undertook, by the sword, to compel mankind to embrace them. Successively conquering and incorporating the little surrounding communities, he at length united under him all the warriors of the Nedsjed, the central and purest seat of the Arabian manners. He made himself master of the sacred cities of Mecca and Medina; and, extending his conquests, threatened at once Mocha, Cairo, and Damascus. Perhaps he and his successors might have established a new empire over the East, had they not been encountered by the kindred energies of Mohammed the Pacha of Egypt. That chief, directing with equal vigour more regular resources and more disciplined troops, proved an overmatch for the militant apostles of the desert. He drove them from Mecca and Medina, and obliged them to sign a humiliating treaty. Ibrahim, his son, pursued them down to Deraie, the capital, which he took, making prisoner Abdallah, the son of Saoud, who was conveyed to Constantinople and put to death. A situation so remote, however, girt with so wide a circle of desert, rendered it impossible to extirpate the Wahabites, who watch, probably, a more favourable moment, if such should arise, for another invasion of the more favoured regions by which they are on every side surrounded.*

SECT. IV. *Political Geography.*

3883. *Arabia is, and has been from the earliest ages, ruled by a number of princes and petty lords, independent of each other, and exercising within their own territory a sort of supreme independent power founded on patriarchal principles. The sway of the father of a family, the first source of subordination among men, is that of which the influence is still most strongly felt among the Arabs. Each little community is considered as a family, the head of which exercises paternal authority over the rest. These, in the course of succession of migration, are split into several branches, that still form one tribe, without being dependent*

on each other ; but their genealogies are carefully counted, and the representative of the senior branch is always regarded with a high degree of respect and deference. The republican form, which originated in the bosom of cities, has never been known or even attempted in Arabia ; but a certain form of confederation is made by the election of a great sheik or " sheik of sheiks," who holds the supremacy. This dignity belongs to a certain family, but out of that family the election is made by the inferior sheiks, from general favour or the opinion of merit. This sway, however, can never be said to assume a feudal aspect, or enable him to summon the other chiefs as vassals. Each, entrenched in his rocky castle, or roaming with his camels and flocks over the expanse of the desert, holds himself independent of every other human power. Individual followers, however, are always ready to flock in considerable numbers to the standard of some successful warrior, who promises either daring adventure or rich booty. Hence it is no difficult matter to collect some thousands of freebooters, sufficient to lay under contribution all who pass by the route near which they hover. On that between Egypt and Palestine, the borders of Syria, and the tract along the Euphrates, large moving encampments continually pass to and fro, observing the progress of the traveller and the caravan, and ready to avail themselves of any favourable juncture. In the interior, among the Bedoween camps, this warlike temper vents itself in almost perpetual petty conflicts with each other. Twice only, men of powerful and aspiring genius have succeeded in uniting together these multitudinous tribes, who then formed armies which the mightiest kingdoms of Asia attempted in vain to resist. These eruptions, however, were only transient, and even that of the followers of Mahomet, though it altered the aspect of the rest of the world, left Arabia itself almost wholly unchanged.

3884. *Yemen forms an exception* to this proud and aristocratic independence of the Arabian tribes, in a district distinguished from all the rest by its populousness and fertility. The Imam of Sana, who succeeded to the government upon the expulsion of the Turks in 1630, has established a government formed strictly upon the model of the despotic kingdoms of Asia. He claims an authority both spiritual and temporal, demands from his subjects the most unqualified submission, and the extreme abuse of his power can only be checked by the desperate expedient of deposition and strangling. He governs the districts and towns by *dolas* and *sub-dolas*, raised usually from the lowest ranks, and the passive instruments of his will. Some traces yet remain of Arabian independence in the *cadis* and the college of justice, without whom no sentence of death can be pronounced. Though they are appointed and may be removed by the sovereign, this last prerogative is one which he seldom ventures to exercise, and their decisions are said to be often distinguished by a high degree of independence and integrity.

SECT. V. *Productive Industry.*

3885. The industry, wealth, and commerce of Arabia may be very briefly described.

3886. We have already seen, *that the general character of the soil* of Arabia is, in a peculiar degree, arid and barren. In a great part of its surface no grain can be raised at all, and in others only that coarse kind of millet, called *d'hourra*, which is the general food of the inhabitants in dry tropical climates. The Arabs, notwithstanding their natural disadvantages and their wandering life, display in some quarters considerable industry in cultivation, particularly in turning to account the scanty rills with which their valleys are refreshed. In Yemen, the contrivances for this purpose are elaborate and extensive. Terraces are formed, and dikes constructed to retain the waters, which are also raised from wells by the labour of the hand to irrigate the fields ; for the use of water-wheels, which answer this purpose with so much more ease and effect, has never been imported from Egypt. But the most interesting culture of these upland tracts consists in the coffee tree, which has now become a necessary of life over a great portion of the civilised globe. This plant grows at a considerable height, where it can be well watered and enjoy even a measure of coolness ; to promote which, it is often fenced round with other trees. The coffee has been transplanted with success to other climates, particularly the Island of Bourbon and the West Indies, where most of that consumed in Britain is now grown. None, however, has ever rivalled in quality the coffee grown on its native hills. That of Bourbon ranks second, though still at a great distance. Its value here is derived from culture, for the wild coffee is altogether unpalatable. The date is extensively produced, and forms a great part of the food of the people. The balsam of Mecca, the most agreeable of all the odoriferous woods, is collected in the neighbourhood of that city, and thence transported to the different Eastern countries. In Yemen it is used only as a perfume, and in Egypt is burnt as firewood in cookery, for the sake of the agreeable odour which it communicates to the dishes. The incense and myrrh, for which southern Arabia is famous, are found there only in small quantities, and are chiefly brought from the opposite African coast.

3887. *If the vegetable culture of Arabia* be thus scanty, its natives, a race wholly pastoral

and wandering, have cultivated with care and success the breed of *the nobler species of animals*. The horse of Arabia, as to swiftness and beauty, enjoys a higher reputation than any other species in the world. This, as already observed, is maintained by an almost fantastic attention to their birth and training. The camel, which seems created expressly for the soft soil and thirsty plains of Arabia, is indigenous to that country, and seems to have been transported thence to the wide tracts, of similar character, which cover so great a part of northern Africa. Even the ass is here of a very superior breed, tall and handsome, generally preferred for travelling to those proud steeds which, reserved for state and for war, cannot be subjected to any species of drudgery.

3888. *Manufactures* can scarcely be said to exist, with the exception of some quite common fabrics for domestic use. But for commerce Arabia enjoyed an early celebrity, of which only faint traces are now to be found. At all periods anterior to the discovery of the passage by the Cape of Good Hope, the greater part of the rich commodities of India were transported either up the Red Sea, or across Arabia from the Persian Gulf. The desert glittered with pearls and gems; and majestic cities, that lie now in ruins, arose amid the waste. Now that the whole of this trade has taken a different channel, the maritime commerce is almost wholly limited to the export of coffee, in exchange for the manufactures of Hindostan. This intercourse, after having been for a long time nearly engrossed by the English, when it centered in Bombay, has of late been appropriated by the active rivalry of the Americans, who, though they give a higher price for the commodity, bring it to Europe thirty per cent. cheaper. The entire quantity exported is now estimated at 16,000 bales, of 305 lbs. each, which the Americans sell at 7*l.* sterling per bale. Aden exports gum arabic, myrrh, and frankincense, chiefly brought, however, from Berbera. Besides this maritime trade, the pilgrimage to Mecca forms a commercial tie between the remotest extremities of the African and Asiatic continents; for the numerous devotees who, from every part of the Mahometan world, resort thither, scruple not to combine with their pious object a good deal of profane traffic, which is made at least to pay the expense of the journey.

SECT. VI. *Civil and Social State.*

3889. *The social existence of the Arabs* is, in one respect, remarkably interesting, as it presents, almost unaltered, an image of what human society was in the earliest ages. The whole going out and in of the patriarchs, their feelings and habits, as described in the book of Genesis, are found unchanged in the tent of the Arabian sheik. A recluse and monotonous life, in the midst of the desert, distance from great cities, and from all the scenes where rivalry and the eager pursuit of pleasure inspire the spirit of change, has left the veneration of ancestry, and the love of antique habits, to operate in full force.

3890. *The Arabs are of small size, spare, and even meagre.* They are less distinguished by strength than by extreme agility. Few nations surpass them in horsemanship, and they are alike intrepid and skilful in the management of the bow, the javelin, and latterly of the musket, since its manifest superiority has introduced that weapon. Their complexion is sallow; a defect which some endeavour to cover by staining their whole body of a brownish yellow colour with the juice of the plant *el henna*.

3891. *The Arabs* are not only temperate, but extremely abstinent. Animal food is scarcely used at all: even among the rich there is little variety of vegetable diet; the milk of their camels, with its several preparations, particularly butter, is the only article with which they season their bread. Among the rich, this bread is composed of rice imported from abroad, and which they boil into pilau, and serve up in a large wooden plate; but the body of the nation are obliged to content themselves with such as can be made from the *d'hourra*. This abstemiousness, no doubt, arises chiefly from necessity; but the higher ranks seem also to value it as a means of preserving those habits of delicacy and cleanliness on which they pride themselves. Any of those symptoms of indigestion which excesses of the table are apt to produce, are marked by them with the deepest disgrace; and instances have been known of individuals who, in consequence of having so exposed themselves, have fled their country, never to return. Though coffee is little valued in its native district of Yemen, where they drink merely an infusion of the husks, it is the favourite liquor in eastern Arabia, and over the desert. They pound it in a mortar, which appeared to Niebuhr to preserve the flavour better than grinding it in a mill.

3892. *The dress of the Arabians* is, in its outline, extremely simple, though set off, among the rich, with ornaments somewhat varied and fantastic. A piece of linen over the shoulder, another round the middle, a girdle, with a *jambaa* knife, form the attire of ordinary Arabs during the day, and their bedclothes when asleep. Some wear only drawers and a shirt. Their sandals, sometimes of wood, cover merely the soles of the feet. The head-dress is the part on which they bestow a lavish profusion of covering and ornament, regardless of comfort, convenience, or any adaptation to the climate. Persons of fashion wear often as many as fifteen caps, piled one above another, and some of thick cloth. This mass is

surmounted with one very splendid cap, embroidered with gold, and having always a sentence of the Koran worked into it. A muslin turban is then wrapped round the whole, the ends of which, flowing loosely upon the shoulders, are ornamented with gold and silver fringes.

3893. *The chiefs of the desert* are deeply imbued with aristocratic feelings, and dwell on their high descent with a pride as lofty as ever prevailed in feudal Europe. This dignity is the more flattering, as it is not conferred or withdrawn at the will of any monarch. It is founded on ideas thoroughly rooted in the mind of the nation, who, like the Highland clans, view every sheik as the natural head of a race so ancient that its origin is traced back for thousands of years. A sheik of an ancient Arabian family would not exchange his title for that of sultan. Another hereditary Arabian dignity is that of *sheriffe*, or descendant of Mahomet, marked by the nearly exclusive privilege of wearing a green turban. This is a distinction of a different class, more widely diffused, and descending often to the poorest among the people. When the green turban is worn by the head of an ancient tribe, it denotes the highest dignity that can exist in Arabia. Such are the twelve families of the Koreish, who can establish by undoubted proof their descent from the immediate office-bearers under Mahomet. In general, however, the inhabitants of cities are viewed by the chiefs of the desert as a mixed and debased race, whom they scarcely own as belonging to the same nation with themselves.

3894. *The most prominent feature* in the Arab character consists in the combination of hospitality and robbery, which are practised, the one most liberally and generously, the other in the most deliberate and merciless manner. It is towards strangers that these opposite dispositions are exercised; and the alternative of good or ill treatment often depends on very nice particulars. The rich traveller, who journeys in caravan over the open plain, is considered as a rightful prey; while he who approaches singly, in a defenceless state, and soliciting protection, acquires an irresistible claim to it. The being once admitted to partake common bread and salt is a sure pledge of safety and protection; and he who, by whatever means, has penetrated into the tent of the Arab, has reached a sanctuary. A change of circumstances often renders the same person an object of the most opposite feelings. He who, under the domestic roof, has experienced the most lavish kindness, may, if met on the open plain, be robbed and murdered; and he who, after being plundered of every thing, enters with confidence the tent of his enemy, will be commiserated, and his distress relieved. In the daily habits of life the generous feeling predominates. A Bedouin, as he sits down to his meal before the door, hesitates not to invite the passenger to share, without consideration that he himself is poor, and the provision scanty.

3895. *The right and practice of private vengeance*, always prevalent among rude tribes and in irregular governments, is carried by the Arabs to the greatest height, and reduced to the most regular system. The fastidious pride of the high Bedouins lays them open to many fantastic wrongs unfelt by others. To say to such an one, "Thy bonnet is dirty," or, "The wrong side of thy turban is out," forms an insult which only blood can efface. Even for one to spit in the presence of another is deemed a provocation that calls for vengeance. In case of murder, the right and duty of inflicting punishment is supposed to devolve upon the friends of the deceased; and they seek to exercise it, not against the guilty individual, but against the head of the tribe, or at least the highest whom their swords can reach. Thus the distinguished Bedouins, especially when they visit the cities, must be armed at all points, and cannot for a moment sleep in security. This fierce pride, however, tolerates and admits a composition not very consistent with itself, which yet is not peculiar to the Arab. It is "the price of blood," upon the acceptance of which the deadly feud is appeased. Such a compensation, however, is of course considered as very little honourable, when compared with the exaction of the bloody vengeance for which it is substituted.

3896. *The Arab, like the European nobleman of the old school*, is ceremoniously and ostentatiously polite. When two Bedouins meet, they shake hands more than ten times, often with fantastic and peculiar ceremonies. The common salutation is "*Salâm aleikûm!*" (peace be with you!) to which the aged commonly add their blessing. Coolness, command of temper, and a great exterior gravity, are considered as the only deportment becoming manhood, and are even affected by children at an early age. Although this studied decorum, and the habits of an ascetic religion, estrange them from every thing which in Europe is called gaiety, they are of a curious and social disposition. This they indulge by frequent resort to coffee-houses, the only public places known in the East: the markets, also, in which all business is transacted, are frequented, as affording opportunities of entering into social intercourse.

3897. *The right of polygamy*, and the seclusion of the female sex, are established principles in Arabia, as in all Mahometan countries; but not to the same extent as among the great in Turkey and Persia. Niebuhr assures us, that the idea which has been held out, of the whole sex being for sale, and going off to the best bidder, is altogether chimerical. Only the poorest and least respectable submit their offspring to that degradation. Such, on the contrary, as are at all in easy circumstances, make it their ambition to provide a dowry for their daughters. Even in the rude tents of the desert, two apartments are provided, of

which the inner is reserved for the females. Here, unless when the husband receives visits of ceremony, they go about almost as freely as European females. In the cities, on the contrary, they never appear in public without a veil, like that of the Egyptians, having only two holes for the eyes to peep through. It is a remark, that Arabian women often maintain great sway over their husbands, and even hold them in open subjection.

3898. *The religion of Mahomet*, which originated in Arabia, still maintains undisputed sway; and Christians, who were once numerous, are now so completely extirpated, that Niebuhr could not hear of a single church existing. The *Sunites* and the *Shiites*, who divide between them the empires of Turkey and Persia, and wage such mortal hostility about they know not what, have also their respective districts in Arabia. The *Sunites* rank foremost, having always had in their possession the holy cities of Mecca and Medina. The *Zeidites* and the *Beiari*, two native sects, reign in the eastern territory of Ommon. These, though they unite in acknowledging the authority of Mahomet and the Koran, have, like other religious sects, some differences, in virtue of which they account themselves the only acceptable worshippers, and all others as heretical and profane. A much more mild and tolerant spirit, however, animates the sects peculiar to Arabia, and is thence communicated to those of foreign origin. They are not affected by the same hostile feelings towards those of other religions, and are strangers to that furious spirit of proselytism which rages among Mahometans in general. Contempt towards foreign sects has with them three gradations: it falls lightest on the Christians; on the Jews next; and heaviest of all on the Banians. The Christians, when they appear in the character of merchants, the only capacity in which Europeans of any consideration usually resort to this country, experience little difference of treatment on account of their faith; and even the Banians, on the same footing, are allowed to settle, and carry on, in Ommon, extensive traffic. Lately, the Wahabite sect, whose political influence has already introduced them to our notice, had absorbed nearly the whole of central Arabia; but their contest with Mohammed Ali, and his triumphant success, have now reduced their influence to a very low ebb.

3899. *The Arabic*, akin to the Hebrew and the Persian, ranks among the classic languages of the East. The distinguished works, however, which have raised it to this eminence were produced out of the limits of Arabia, in the splendid courts founded by the Mahometan conquerors. Yet the spirit which breathes in them is still to a great extent Arabian. The perpetual movements among this multitude of little tribes, their wanderings, their feuds, their wars, the comparative estimation of the female sex, have generated a spirit of romance and adventure affording scope for the imagination. The tale, in listening to which the Asiatic, as he reclines at ease in the coffee-house, finds his most refined and animating amusement, seems to be the form of composition carried by their writers to the greatest perfection. The stories, indeed, so celebrated under the name of the *Thousand and one Nights*, were produced at Bagdad, under the brilliant reign of Haroun Alraschid. That work has, however, a basis of Arabian ideas mingled with those inspired by a splendid and mercantile capital. The romance of *Antar*, lately introduced to the British public, was produced within Arabia itself; and, though of ruder construction, and less suited to the general taste of mankind, is by no means destitute of poetical merit. The Arabians have still poets, who celebrate the exploits of their sheiks; but none of these can dispute the palm with the ancient bards of the nation. The works upon astronomy, history, geography, and medicine, by which Arabian writers have distinguished themselves, were produced at Bagdad, Fez, and Cordova; and these sciences, in Arabia itself, have always been and are in a very low condition. The first elements of knowledge, however, are pretty generally diffused. Schools are attached to every mosque; and there are others, by means of which many, even among the lowest of the people, learn to read and write. The schools are merely sheds, open toward the street, in which the scholars repeat their lessons aloud, undisturbed by what is going on without. Printing, however, has not made any progress; and the Arabs, who value themselves on an easy and flowing mode of writing, dislike the stiff appearance which their characters make when they issue from the presses of Europe.

SECT. VII. *Local Geography.*

3900. *In making the circuit of Arabia*, we shall begin with the region at the head of the Red Sea, one of the most desert tracts of this desert land; yet a celebrated and sacred spot, where rise the holy mounts of Horeb and Sinai. The wilderness in which they are situated is most gloomy, presenting long ranges of rugged and precipitous rocks, intersected by deep valleys, at the bottom of which are found the only traces of verdure. Sinai is ascended by a very steep route, which in many places is rendered practicable only by steps cut in the rock. The summit is marked both by a Christian church and a Mahometan mosque; and this combined veneration is further cherished by a pretended impression made in the rock by the foot of the camel on which Mahomet was conveyed up to heaven. Sinai can boast of two spacious convents erected on opposite sides of the mountain, for the reception of the numerous pilgrims by whom it was once visited. The largest, called the Monastery of the Forty

Saints, is now entirely in the hands of the Arabs, who have driven out the monks, its former tenants. The convent of St. Catherine, however, is still supported by the contributions from the faithful of the East. It is really a handsome building, 120 feet long, having a church paved with marble, of which the altar is enriched with gold and jewels. At a little distance is an excellent garden, accessible from the convent by a subterraneous passage. This precaution is necessary, as the roving Arabs, who keep the place in constant blockade, are always on the watch to kill and carry off whatever they can. A little to the west of Sinai is Horeb, a mountain neither so lofty nor so rugged, but containing on its top some springs and verdure.

3901. *Proceeding south-east*, along the Red Sea, we come to the Hedjaz, or Stony Arabia, a region sacred over the East, as the birth-place of Mahometan superstition. It consists of a sandy and barren plain, behind which, in the interior, rise chains of mountains, rugged indeed, but yielding some valuable products, especially the balm of Mecca. Amid these mountains are situated the metropolitan cities of Hedjaz and of Arabia, the holy cities of Mecca and Medina. An awful prohibition against any infidel foot which should attempt to approach these sacred spots rendered them almost unknown ground until very recently, when the daring curiosity of European adventurers triumphed over every obstacle. Mecca (*fig. 574.*)

MECCA.

was then found to be a considerable city, one of the handsomest in the East. It stands in a narrow valley, enclosed between rocky hills, following their sinuosities, and partly built on their declivities: the fronts of the houses, instead of presenting, as in some Eastern cities, a long range of dead earthen wall, are of stone, raised to the height of three or four stories, and ornamented with columns and architectural ornaments. This gay aspect seems assumed in a great measure to attract pilgrims as lodgers, and with the same view the apartments are made neat and commodious. The resort of devotees of so many nations, from the

extremities of Tartary to the banks of the Senegal, rendered Mecca, in peaceful times, a very flourishing city; and it has been supposed, probably with exaggeration, to contain 100,000 inhabitants. Burckhardt reckons now only 30,000. The Wahabite war, from which it suffered deeply, rendered the avenues to it no longer secure, especially as the Wahabites, though they themselves revered the holy places, shut them against the approach of those whom they deemed heretics; but since they came into the possession of Mohammed Ali, they have been thrown open to the Mahometan world. The temple of Mecca forms a very spacious square, about a quarter of a mile in each direction, with a triple or quadruple row of columns. A number of steps lead down into the interior, containing the object sacred to a Mahometan eye, the *Kaaba*, or house of the prophet, and within it the black stone, brought down by the angel Gabriel to form its foundation. To kiss this sacred stone, to go round it seven times, reciting appropriate hymns, form the completion of that religious service for which thousands of miles have been travelled. The last ceremonial is ablution in the well of Zemzem, which, though itself not the purest water, is supposed to cleanse the votary from all sin. A pilgrimage, often tumultuary, to Mount Arafat, completes the round of religious observance. A very active commerce in Mecca is combined with pilgrimage, consisting in the exchange of the richest commodities from the most industrious countries of the Mahometan world. Mecca, till it was conquered, first by the Wahabites, and then by the Pacha of Egypt, was almost a free city under its own sheriffe. The Meccaways are proud, gay, and somewhat dissolute; they are enabled to live in pomp by the gifts and sums paid for lodging and attendance by the numerous pilgrims.

3902. *Medina*, notwithstanding its high claims as the burial-place of Mahomet, has never rivalled Mecca in the veneration of the East. To visit it is not even considered as an indispensable duty, and is little practised, unless by the Turkish pilgrims, in whose route it lies. Hence Medina contains not more than 500 houses, few of which show any degree of elegance or splendour. The great mosque, however, which encloses the tomb, is described as very splendid, being surrounded by numerous pillars of marble, jasper, and porphyry, on which letters of gold are in many places inscribed. The tomb itself is rather remarkably plain, conformably to the simplicity still affected in the age of Mahomet; and on each side of it are those of the two early caliphs, Abu Beker and Omar.

3903. *Of the ports along this coast*, Tor, once an extensive seat of the commerce with India, now scarcely exists. Its harbour is still good, and in its vicinity are several populous villages. Yembo, the port of Medina, is of moderate size, like the city to which it is subservient; yet has a population of 5000 or 6000. Judda belongs to Mecca, and is the main emporium of the Hedjaz. It is mainly supported by the caravans which, from motives of religion, trade, or both combined, come across from Suakin to Mecca. This route is followed by almost all pilgrims from the interior and centre of Africa, while those from Barbary take the way of Egypt. Judda serves in a great measure as the port of Egypt as well as of Mecca. The annual Indian fleets here unload their cargoes, which are transported by the merchants of the place to Suez and Cairo. Judda has thus a population of 12,000 or 15,000 inhabitants, and Burckhardt understood it to contain individual merchants worth nearly 200,000*l.* The town is neatly built of madrepores, and is, on the whole, a flourishing place. The entrance is obstructed by dangerous shoals, but upon a signal given, pilots hasten out, and guide the vessel through all those perils.

3904. After a protracted voyage along a dreary coast, the navigator at length reaches the

celebrated shores of *Yemen*, or the *Happy Arabia*. It does not, however, at once present that smiling aspect, nor waft those gales of perfume, which have been described by the fancy of the poets. A belt of flat, sandy, barren territory still forms the immediate border of the sea; and the traveller must penetrate a considerable distance into the interior before he reaches those fertile valleys, and those hills richly crowned with aromatic shrubs, for which Yemen is famed. This, like other fertile countries, has been subjected to a despotic yoke; the government being exercised by the Imam, in the capacity of priest or servant of Mahomet. He maintains an army of 4000 foot and 1000 horse; but his revenue is not supposed to exceed 80,000*l.*, produced chiefly by duties on the export of coffee. His power, as already observed, is considerably checked by some controlling bodies; and the Djebal, or mountainous district, contains many little tribes by whom it is set at open defiance.

3905. *Yemen* contains some considerable cities. Sana, the capital, is one of the neatest in the East. It is built of brick and stone, and contains several handsome mosques and palaces, as well as spacious caravanseras for the reception of travellers. The vicinity abounds with fruits, but scarcely affords wood sufficient for fuel. Taas is another city, about half the size of Sana, surrounded by a mountainous territory, supposed to be the richest in the world in botanical productions.

3906. It is by its ports, however, that Yemen is best known to Europe. Loheia, the most northerly, though situated in a poor country, with a shallow harbour, and bad water, exports a good deal of coffee, but of secondary quality. A better sort is found at Hodeida, to which has been transferred the trade of the once flourishing port of Ghalefka, now entirely choked up with sand. All these are secondary to Mocha, (fig. 575.), the chief mart for coffee, and superior to all others on the Arabian Gulf. It has declined, however,

575

MOCHA.

very considerably from the period when that favourite beverage could be procured only on the hills of Yemen; but now that the maritime nations of Europe derive their supply chiefly from their own colonies, recourse is had to Mocha only for some of very superior quality. It is situated on a flat sandy plain, over which hot winds continually blow. From the sea, its whitewashed houses, variegated by handsome minarets and tombs, make a pleasing appearance. On entering it, however, the filth of its streets, and the decayed appearance of many of the walls, built only of unburnt brick, produce a much less favourable impression. The population is not supposed by Lord Valentia to exceed 5000; and the trade is chiefly conducted by about 250 Banians and Gentoos. Moosa (fig. 576.), in its vicinity, the ancient emporium of Yemen, though now decayed, presents still a noble appearance. Beyond

the straits is Aden, also a famous port, usually considered part of Yemen, but recently erected into a separate kingdom. Its commerce rests upon the export of myrrh, frankincense, and balsams, drawn in small quantities from Arabia itself, but largely from the opposite African coast of Berbera.

576

MOOSA.

3907. The coast of Arabia, where it ceases to be parallel to that of Africa, and faces only the expanse of the Indian Ocean, is called *Hadramaut*. A great part of it is barren and dreary, and the interior, called *Mahrah*, forms a most extensive desert; but there are tracts interspersed with hills which almost rival Yemen in their smiling fertility. They produce few commodities, however, that are fitted for export; and the ports of Macula, Curiamuria, Morebat, and some others, are visited by foreign vessels chiefly for the purpose of obtaining water and refreshments.

3908. The coast of Arabia, after extending north-east more than 1000 miles facing the ocean, and passing Ras Masera, changes its line to the north-west, and runs parallel to southern Persia. From this point to the entrance

of the Persian Gulf is the coast of Oman, or Ommon. Though not the most celebrated, this appears to be the most flourishing and prosperous part of the whole Arabian peninsula. It is destitute, indeed, of the aromatics of Yemen; but its rich soil produces in abundance grain, fruits, and dates. Muscat, the capital, was taken by Albuquerque in 1507, and remained subject to the Portuguese until 1648, when they were driven out by an insurrection of the natives. It is now governed, like Yemen, by an Imam, or spiritual chief, who seems to exercise his power much for the benefit of his people. The government of the Imam is the most tranquil and protecting of any in the maritime parts either of Persia or Arabia. It is frequented as a sort of general depôt for the merchandise of Persia, India, and Arabia, which, from the excellent police, lies open and unguarded in the streets, without danger of depredation. All the ports upon this coast are tributary to the Imam, and he has subjected Brava, Zanzibar, and other important points on the eastern coast of Africa. A considerable trade is also carried on by caravans with the interior. High rocks on one side, and the island of Muscat on the other, form a spacious secure harbour, which cannot indeed be entered without certain precautions; but on a signal made, excellent pilots immediately come out. The town is surrounded by a strong wall, within whose precincts only Arabs and Banians are allowed to reside: all strangers must remain in mat-houses without the gates. The population is stated by Mr. Buckingham at about 10,000. About 100 miles to the south-west, near the mouth of a small river, is Sohar, anciently celebrated as the capital of eastern Arabia, but now much declined, its greatness being completely eclipsed by Muscat.

3909. Cape Mussendoon, a bold and deeply indented promontory, forms the termination of a long rocky peninsula, and shuts in, upon the eastern side, the entrance of the Persian Gulf. This peninsular tract is

inhabited by a mixed race of Arabs and Portuguese. As we proceed up the shores of the gulf, we find it in possession of a bold and desperate race, the *Joasmi Arabs*. Placed on the maritime route by which all the commerce between Persia and India must pass, they have availed themselves of this position to carry on a most outrageous system of piracy, accompanied with every circumstance of deliberate cruelty. These proceedings roused the indignation of Britain, who felt herself called upon, as the chief maritime power in these seas, to put down this destructive scourge. The first expedition, though successful, being insufficient to prevent a recurrence of the evil, another was undertaken some years ago, in which the main hold of the pirates, Ras el Khyma, was taken and completely destroyed, and their power so broken, that it is expected they will no longer interrupt the tranquillity of the Persian seas.

3910. *Continuing to ascend the gulf*, the next district is that of *Lahsa*, or *Lasha*, inhabited by the powerful and wide-spread tribe of Beni Khaled, and forming the eastern termination of the great mountainous interior tract of the Nedsjed. It is well watered, and traversed by one of the chief of the small rivers of Arabia, called the Astan. Lahsa, the capital, near the mouth of this river, is described as a considerable city; and Kalif, built of rock salt, carries on some trade. Opposite to it is the island of Tarent, seven miles long, and covered with delightful gardens. But the most interesting object on this coast is the large island of Bahrein, near which is a bank producing the finest pearls in the world. They are procured by divers, who, descending to the bottom, cut the long thin fibre by which the muscle containing the pearl is attached to the ground. The commerce in this product has given rise to the town of Medina, of 800 or 900 houses, which, though its harbour can receive only vessels of 200 tons, carries on a good deal of intercourse with Bassora; and the rest of the island is covered with gardens and villages.

3911. We have now completed the survey of the coasts of Arabia: *the interior* is too little known to call forth much observation. The southern part presents, on our maps, almost an entire blank; generally understood to consist of desert, though, doubtless, a closer observation would bring to view many fertile spots. The centre from Mecca to Lahsa is crossed by the mountainous tract called the Nedsjed, which, according to credible information, contains fertile valleys, a considerable population, and even towns of some magnitude. It carries on also some inland trade, and is traversed by caravan routes in several directions. No European traveller, however, has ever ventured across it, or illustrated it with any precise or authentic details. This region, however, is now the most important of all Arabia, since it contains the seat and origin of the Wahabite power; and the numerous hosts which have issued from it under the standard of that power afford a clear proof that it is not throughout a desert. In its eastern quarter is Deraie, the Wahabite capital, lately taken and demolished by the Pacha of Egypt, but which, being too distant to be permanently held by him, will probably resume its importance. More in the centre is the city of Temama, noted as the birth-place of Moselama, the most celebrated of the Arabian prophets before Mahomet.

3912. *The remainder of Arabia* consists of that outer portion which, in the form of a triangle, extends along the borders of Palestine, Syria, and the course of the Euphrates. In its central part, this is the most completely desert tract of all Arabia, presenting nowhere any vestige of culture or fixed habitations, and traversed only by tribes shifting as the sand of the soil on which they tread. In approaching Syria and Judea, the desert insensibly loses its character, and passes into the fine soil of those fortunate regions. The districts, however, which have succeeded to the powerful semi-Arabian states of Moab and Ammon, are, according to modern geography, annexed to Syria and Palestine, and nothing is left to Arabia but complete desert. Even Palmyra, with its surrounding wastes, is considered as Syrian. On the south the ancient Edom, or Idumea, contains some well-watered valleys, and presents monuments of the power and commerce for which it was anciently celebrated. The ruins of its capital, Petra, lately discovered by Burckhardt, display considerable magnificence. He found 250 tombs cut in the rock. The monuments were partly of Greek and partly of Egyptian architecture. Along the Euphrates, the desert and the river touch immediately on each other. Its banks form necessarily a great and crowded caravan route, and there the plundering tribes expect their richest harvest. They are found, accordingly, in large bodies, and of the most hardy and desperate character. A number, availing themselves of the decayed state into which the Turkish government has sunk, have penetrated into the rich Mesopotamian plain, between the Euphrates and the Tigris, where they feed their flocks, set the government at defiance, and, tempted by the exuberant fertility of the soil, have, in many instances, gradually acquired industrious and agricultural habits.

CHAP. IV.

PERSIAN EMPIRE.

3913. *Persia*, in the earliest times, was the seat of one of the most powerful Asiatic monarchies, connecting Eastern with Western Asia, and, in later ages, acted with energy on the political system of Europe. Although abridged of its ancient greatness, it still presents many interesting features.

SECT. I. *General Outline and Aspect.*

3914. *There is no country whose boundaries are more difficult to define than those of Persia.* It has none decidedly formed by nature, and is surrounded on every side by disputed provinces, whose lot depends on the varying fortune of arms, and on those frequent revolutions to which Oriental empire is liable. Long usage has made the Indus be looked upon, in Europe, as the western boundary of Persia; but the recent observations of Elphinstone, Pottinger, and other English travellers, have proved that the regions of Cabul, Candahar, and Balk are, in a political sense, entirely independent of Persia, and present a physical and social system in many respects opposite. Upon the same principle, it seems impossible to concur in the arrangement by which the savage tracts of Mekran and Beloochistan continue to be considered as part of the Persian empire. We shall, therefore, designate this vast and rude interval between that empire and Hindostan by the appellation of Independent Persia; for that of the kingdom of Cabul would apply only to a small part, and would indicate only a temporary and fluctuating state of things. Again, the northern limit to the west of the Caspian has been closely narrowed by Russia, which, by a long train of successful warfare, has nearly annihilated the ancient influence of Persia over the Caucasian

regions, and deprived it even of its provinces of Shirwan and Daghestan. In the north-east, notwithstanding the loose tenure by which the great province of Khorassan is held, and though Herat, its greatest city, has been in the hands of the Afghans, it would be yet premature to separate that province from the great empire to which it has been so long united.

3915. *Persia, thus defined, presents a large, irregular expanse of territory.* Its northern boundaries are the Caucasian region, now occupied by Russia, the Caspian Sea, and Independent Tartary. On the east, it has that country to which we have given the name of Independent Persia. The Persian Gulf, and a small part of the Indian Ocean, form its limit to the south. On the west is the Turkish empire, from which it is separated by a line drawn somewhat within the Tigris. The empire may thus, in a large view, be considered as extending from 26° to 40° of north latitude, and from 42° to 60° of east longitude, which would give in the former dimension somewhat less, and in the latter somewhat more, than a thousand miles.

3916. *This vast region does not present a very varied aspect.* Although Persia can boast some of the grandest natural features, they rather range along her boundaries than penetrate the interior. The Caspian and the Persian Gulf are entirely liminary. The Euphrates and Tigris are now within the Turkish frontier. Russia has wrested from her the chain of Caucasus, and Turkey disputes the lofty heights of Ararat. From these two chains, however, branches one of considerable magnitude, which runs through the northern provinces, leaving only a narrow but fertile plain between it and the Caspian. It is thence supposed to take its course westward, till it joins the mighty ranges of the Hindoo Koosh and Himalayah. Through these mountains is that rugged pass, which the ancients considered as the main access from southern to northern Asia, and to which they gave the appellation of the Gates of the Caspian. Another chain, under the appellation of Alagha Tag, separating from the Taurus, runs parallel to the western frontier, and, under the names of the mountains of Louristan and Bucktori, extends to the Persian Gulf. With these exceptions, Persia is rather a high than a mountainous country; its ridges soon terminate in wide table-lands, traversed by nomadic and pastoral hordes. Between these elevated tracts, however, intervene plains, as those of Shiraz and Ispahan, displaying all that brilliant fertility and beauty which distinguish the favoured regions of these fine climates. The streams which water them, absorbed in cultivation, or expanding into lakes, form merely local features, and never attain a magnitude which can give them a prominent place in the general delineation of the country.

SECT. II. *Natural Geography.*

3917. *The Geology* of this country is too little known to afford room for any observations; and the botanical remarks chiefly belong to the mountainous region of Independent Persia. The following observations occur under the head of Zoology.

SUBJECT. *Zoology.*

3918. *The Zoology of Persia*, from the little authentic information existing on the subject, appears of a mixed nature, exhibiting many of the European animals, with several others more strictly belonging to Asia. The most remarkable of those common to this country are the following:—

Felis uncia. Ounce.
Arvicola astrachanensis. Astrachan Mouse.
Mus decumanus. Brown Rat.
Mus phœus. Astrachan hamster.

Aspalax typhlus. Spalax.
Sciurus persicus. Persian Squirrel.
Antilope leucoryx. White Oryx.

Antilope subgutturosa. Persian Gazelle.
Antilope Dorcas. Dorcas Antelope.
Rupicapra persica. Persian Chamois.

3919. *Of the above, we shall subsequently notice* the Spalax, the Brown Rat, and the Persian Gazelle. The Asiatic Lion is stated to be not unknown in the deserts of Persia. The *Lynx caracol* has been called the Persian Lynx, although, from being spread over the northern parts of Africa and of south-eastern Asia, it does not merit this peculiar designation. The White Oryx Antelope prefers the deserts; and the Dorcas Antelope appears to be also found in those of northern Africa. In addition to these, Linnæan writers mention the Brown Bear, the Otter, *Viverra Mungo L.*, Striped Hyena, Fallow Deer, and the European Hare, as all inhabiting the Persian empire.

3920. *The Spalax, or Blind Rat of Pennant*, was formerly confounded with the mole. This singular animal has a thick head, terminating in a very hard and strong cartilaginous muzzle. It was long believed the Spalax was destitute of eyes, nor can any external trace of these organs be seen; but on removing the skin they are found to be perfectly organised, although so small as not to exceed half a line in thickness. On the other hand, the organs of hearing, although externally very small, are shown to be considerably developed, by the great size of the auditory canal. The habits of the animal are equally curious. The Spalax lives in societies beneath the earth: they bore excavations towards the surface in search of roots; but they dig one hole much deeper, into which they retire for shelter and safety. As they prefer cultivated grounds, and subsist principally upon roots, they frequently become a serious evil to the agriculturist. Their movements are precipitate, turning or running sidewise, or even backward, with facility; and they bite most severely. When on the surface, they almost always carry the head raised, apparently for the purpose of more effectually hearing what is passing around them; thus relying on their most perfect faculty for a forewarning of approaching danger, which they have not the means of detecting by sight. (*Griff. Cuv.*)

3921. *The Brown Rat* (*fig. 578.*), improperly called the Norway Rat, one of the greatest pests of our dwell-

BROWN RAT.

ings, originally came to us from Persia and the southern regions of Asia. This fact is rendered sufficiently evident from the testimonies of Pallas and F. Cuvier. The former acquaints us with their migratory nature, by stating that, in the autumn of 1729, these animals arrived at Astrachan in such incredible numbers that nothing could be done to oppose them: they came from the western deserts, nor did the waves of the Volga arrest their progress. They only advanced to the vicinity of Paris in the middle of the sixteenth century, and in some of parts of France are still unknown. Towards the north their gradual extension has been slow, nor have they yet been found in Siberia.

3922. *The Gazelle* (*fig. 579.*) has been long immortalised by the poets of Asia and of Europe. It is called by the Persians *Tzeiran*, and by the Turks *Jairan*: its size is small, being seldom more than two feet high and three feet seven inches long. The eyes are large, dark, and peculiarly expressive of softness: all its movements are replete with grace, agility, and timidity. It not only inhabits the hills of northern Persia, but is found also in troops in the sandy deserts of Asia Minor, and on the shores of Lake Baikal. It is hunted by the Persians and Tartars for its venison, which is said to be delicious.

GAZELLE.

FEMALE CROWNED PHEASANT.

3923. *The Ornithology* does not present us with any subjects of peculiar interest. The Nightingale is well known, and has long been celebrated by the poets of Persia; but whether it is the same species with that of Europe may safely be questioned.

3924. *The female of a new species of crowned Pheasant*, belonging to a decidedly Asiatic group (*Lophophorus Nigelli*) (*fig. 580.*), has recently been discovered in the more secluded and mountainous parts of Persia, where it is called the Mountain Partridge: it is so rare, that the male bird has not yet been seen in Europe. The female measures about twenty inches in length: the colours are brown varied with black, with the throat and sides of the neck white.

3925. *Of the Domestic Animals*, the Persian breed of Goats is peculiar. The horns form an acute angle to the front; the ribs not very broad, with the margin undulated, and the posterior part rounded. It has long coarse brown hair, tipped with rufous, and a large tuft stands forward between the horns, like the forelock of a horse. The two-humped or Bactrian Camel, and the Dromedary or Arabian Camel, are both in general use as beasts of burden. The Persian Horses are esteemed inferior alone to those of Arabia, and the preservation of the noble breed is attended to with equal care. Towards the northern provinces there is a much stronger race, used for cavalry.

SECT. III. *Historical Geography.*

3926. *The Persian empire* is celebrated in history. In its vicinity, and almost on its site, were the great and early monarchies of Assyria and Babylon. The name and people of Persia were then confined to the mountainous districts of Fars and part of Kerman; while the Medes, tributaries of Babylon, held the fine plains of the interior. The Persian empire was formed after the triumph of Cyrus over Babylon; and, by the addition of Syria, Egypt, Asia Minor, and part of India, attained a magnitude unprecedented. The progress of luxury and effeminacy having sapped those manly virtues by which the Persians rose to power, they were unable to withstand the hardy and disciplined troops of Macedon; and this country, with all its conquests and possessions, was rapidly swallowed up in the fourth or Greek empire. Persia ceased to have an independent government, and was subject partly to Seleucus, and partly to a Greek kingdom formed in Bactriana. In the third century before Christ, Artaxerxes rescued his country from foreign sway, and founded Parthia, a monarchy which has ever since retained nearly the same limits. It acquired distinction in history by setting bounds to the conquests of Rome, and by frequently defeating the armies of that power. About the year 220, the Parthian dynasty was subverted by that of the Sassanides, who restored the name of Persia, with its ancient religion and laws. It could not, however, withstand that torrent of fanatic invasion which in the seventh century overran a great part of the East. After one great battle, the native dynasty was subverted, and Persia received the new faith and the new laws, which have ever since ruled over more than the half of Asia. This Saracen dynasty, which soon began to exert an influence friendly to science and civilisation, was subverted, in its turn, by successive Tartar invasions under Zingis, Timur, and the race called Turks. These successively supplanted each other; and Persia became, during many centuries, a dreadful theatre of war and devastation. She possessed, however, a native energy, by which she ultimately repelled every foreign yoke. In 1506, Abbas, justly surnamed the Great, raised himself to the throne; and, by enforcing a rigid administration of justice, and encouraging every species of industry, restored Persia to much of that prosperity for which nature had destined her. After thus flourishing for more than two centuries, she was desolated in the most cruel manner by the successful invasion of the Afghans, who carried fire and sword to her remotest extremities, and reduced her proudest capitals to ashes. In about fourteen years, the avenging sword of Nadir Shah vindicated the independence of his country, and, under the name of Kouli Khan, carried her victorious arms into India; but this fierce conqueror suffered her to taste none of the blessings of peace. His death without any regular successor, affording scope to the contending claims of a number of chiefs, gave rise to a long and furious civil war, which almost rent Persia to pieces. She enjoyed an interval under Kurreem Khan, an able chief and one of Nadir's lieutenants, who having at length triumphed over all his rivals, endeavoured during sixteen years to heal the wounds of his native country. His death, in 1779, was followed by a new train of civil wars, only terminated, in 1792, by the triumph of Aga Mohammed, an eunuch, who transmitted the throne, in 1796, to Futteh Ali Shah, the reigning sovereign. Persia, under his administration, has begun to respire. Although he has had severe contests to maintain with the Russians, who have wrested from her extensive provinces, internal peace has been preserved, and considerable exertions have been made to improve the condition of the country. Attempts have even been made, particularly under the auspices of his third son, prince Abbas Meerza, to introduce European improvements.

SECT. IV. *Political Geography.*

3927. *The Persian monarchy* is more deficient than even other Oriental states in all that belongs to a constitutional system. The sword alone reigns. Those strict and immutable laws, for which she was anciently celebrated, have, by successive revolutions, been entirely obliterated. The despotic principle inculcated in the Koran, by which the sovereign exercises a divine right over the persons and properties of his subjects, is fully recognised. All the resources of Oriental exaggeration are exhausted by the grandees in the lofty epithets with which they address the monarch, and the humble appellations which, in his presence, they apply to themselves. It is remarked by Porter, that there never was such a thing as a popular commotion in Persia; a remark which does not apply to Turkey. The numberless contests for power have been carried on merely by the princes and their adherents; the people look on as spectators, ready to be transferred to one or other as the fortune of war may decide. Yet, though there are no legal, there are some rude actual limits to the royal authority. The khans of the upland districts, ruling over tribes attached to them by ties of kindred and clanship, enjoy permanent and hereditary rights, to which the sovereign seldom attempts to refuse his sanction. They pay merely a tribute, and furnish their quota of troops in war, but are not interfered with in the internal administration of their district. As they form the military strength of the empire, the most powerful monarchs dare not offend them; and as, from motives of personal attachment, caprice, or ambition, they are often ready to espouse the cause of different pretenders to the throne, they have a powerful

influence in perpetuating those evils of disputed succession to which Persia is liable. From the khans the principle of hereditary succession has taken deep root in the political system of Persia. It formerly extended even to the governors of cities and provinces, who were also collectors of the revenue; but under the dynasty of the Abbassides this system was changed, and the power intrusted to removable officers. Although the patronage and even the revenue of the sovereign were thus augmented, the measure is supposed to have been substantially injurious to Persia. These high-spirited chiefs, who had a real interest in the prosperity of their districts and of the empire, have been replaced by the base creatures of despotism, who had no object but to amass wealth by the temporary possession of power. The precarious tenure by which they hold the throne induces the sovereign to employ strange and barbarous methods of crushing the attempts of rival claimants. Mutilation, particularly the putting out of the eyes, is the method peculiarly employed against those from whom danger has been experienced or apprehended. The daughters of the king are given in marriage not to the nobility, but to the priesthood, excluded by their profession from any pretensions to reign.

3928. *Persia, though a warlike kingdom*, has scarcely any force which can be considered a regular army. There is a body of 2000 or 3000 horse guards, called Goolam, composed of youths of distinction, who assume, however, the title of royal slaves. A larger body of 10,000 or 12,000 cavalry have lands assigned them round the capital, and are ready to attend the king when called upon. But the main force of the Persian armies has always consisted of their highland tribes, led by their khans. The number which can be called out on an emergency is estimated at 150,000, 200,000, or even 250,000. They possess many of the qualities of good cavalry troops, are well mounted, skilful horsemen, personally brave, and inured to hardships. They handle their arms with the greatest dexterity, but have not the least idea of discipline, tactics, or the art of war. A late traveller compares them to "an army of wild animals from the jungle, led on or scared by accidents." They are arrayed, indeed, according to their tribes, under their khans; but the review of a corps consists merely in causing the troops to march past individually, to show their persons and equipments. They will often, as humour leads, abscond in large bodies, or turn back without seeing an enemy. Through these defects they are altogether unable to bear the shock of disciplined European troops, and have always been vanquished in pitched battle. But as voltigeurs or light cavalry they have scarcely their equals in the world. They hover round an enemy, cut off his provisions and water, make sudden onsets, and insensibly wear him out. The most formidable regular army, when once involved in the heart of those endless and trackless plains which compose the interior of Persia, can scarcely fail to be finally overwhelmed. Thus, the Parthians destroyed the armies of Crassus and Julian, and have always been invulnerable except against Afghans and Tartars, nations of migrating horsemen like themselves. Even the Russians, notwithstanding their great superiority in the field, have not been able to maintain any line advanced beyond the Caucasian districts, or the course of the Kur.

3929. *The present sovereign* has made extraordinary exertions to form and discipline a corps after the European manner. This system was first introduced by Gardenne, a French envoy sent by Bonaparte for that purpose, with the view of acquiring an influence in the court of Persia, and of rendering it an instrument for shaking the British empire in the East. Sir Harford Jones, however, succeeded in opening the eyes of the shah to the ambitious designs of that potentate. The English then succeeded to his favour; and arms and officers were supplied from this country. The system was carried on. According to Sir R. K. Porter, the actual amount was about 12,000 men in infantry and artillery, who went through their exercise in a very tolerable manner. The cavalry, however, accustomed to roving excursions, and believing, with truth, that they could manage the sabre better than any troops in the world, could not be brought to place themselves under discipline. These troops were neglected by the reigning sovereign; and, on the breaking out of the war with Turkey, the English officers, not being allowed to serve against that power, were almost all dismissed. The present regular army is reckoned by Mr. Frazer at 9400 foot and 1200 horse; and from the provinces of Aderbijan and Erivan, which are alone much under the control of the shah, he can levy about 40,000 irregulars.

3930. *An unhappy circumstance in the condition of Persia* consists in the numberless predatory hordes by which the country is ravaged. Her fertile plains are every where intermingled with mountains and deserts tenanted by these rude banditti. Even those who defend the country in war, plunder it during peace. That mountain chain, in particular, which we have traced from Armenia to the Persian Gulf, parallel to the great road that passes through the kingdom, forms a "labyrinth of countless ravines and formidable gorges," whence they can issue forth to lay waste the finest plains, and attack the richest caravans. In consequence of their continued *cheepaos* or forays, many of the finest tracts are now abandoned by the husbandman, and given up to those marauders. To repress them was one of the grand objects of the policy of Abbas, which he pursued by measures cruel, indeed, but vigorous. The present monarch, less energetic, and residing in the northern extremity of his empire to watch the movements of the Russians, does not seem to have taken such effective steps for this object.

3931. *The only attempt of Persia to form a navy* has been on the Caspian Sea, and in this she has never succeeded.

SECT. V. *Productive Industry.*

3932. *The Persians* are an active and laborious people; and if all the branches of national industry are in a low state, it is owing only to the anarchy of the government, and the inroads of the predatory tribes.

3933. *In regard to agriculture*, the country labours under considerable disadvantages. The interior, as formerly observed, is not traversed by any great rivers, and a great part of the soil is naturally salt, sour, and arid. This evil, however, in the better days of Persia, was in some degree obviated by artificial irrigation; and at all times the plains of Ispahan and Shiraz, and the provinces on the Caspian, have displayed an exuberant fertility. The kinds of grain cultivated are chiefly those of Europe, particularly wheat; for rice, which would naturally have been the staple of the southern provinces, cannot be raised there for want of water. In return, the fruits are of peculiar excellence, and some of the most valuable are even traced to Persia as their native country. The melon is supposed to be there unrivalled, the orange is of peculiar size; the fig, the almond, the peach, the apricot, are all good. The vine and its produce were once the pride of Persia; and, notwithstanding the severe prohibition against its use, the wine of Shiraz continues to be the theme even of Eastern poetry. Those of Yezd, of Ispahan, and of the hilly provinces in the north, are all esteemed. In these last, the mulberry tree grows in such abundance as to render silk a staple product of the empire; and in its days of prosperity a large article of export. The plains of these provinces afford also extensive plantations of the sugar cane; which, however, is used only in its raw state. They abound also in woods, which are turned to little account. After all, it is to pasturage that the greater, and of late an increasing, portion of the surface of the empire is devoted. In these tracts the primary object is to rear those fine horses which are in universal demand; for every Persian rides, and delights in the possession of the finest horses he can possibly procure. Those of the Turkman breed are preferred to the Arabian; for, though inferior in swiftness, they are stronger and more serviceable; and, though not equally light and elegant in form, they are tall and handsome. Sheep of the long-tailed species are bred in great numbers, and their wool forms the basis of the finest manufactures. Kerman produces a breed of goats yielding wool, which has, in a certain degree, the qualities so much esteemed in that of Cachemire. The camel, the ass, and a valuable species of mule, are used for the conveyance of burdens.

3934. *Persia, during the days of her prosperity*, was greatly distinguished as a manufacturing country. Her fabrics, suited to the Oriental taste, have supported not only the ostentatious magnificence of her courts and great men, but those of Turkey, Tartary, and even Northern Africa. The women of the wandering tribes weave from the wool of their sheep those rich carpets which we call Turkey, from the place of their immediate importation. They form through the East the most important branch of ornamental furniture. The carpets of Herat, in Khorassan, possess the highest reputation. The next staple consists in silk fabrics, rich and ornamented, particularly brocade and embroidery. Sometimes the tissue is entirely silk, sometimes mixed with cotton and wool. Under the Abbasside dynasty, the precincts of the court contained great works of tapestry, composed of silk and wool embellished with gold; but this art, though not entirely lost, languishes for want of encouragement. Arms, particularly sabres of a superior quality, and richly embellished with gold, silver, and precious stones, are prepared on a great scale, to meet a sure demand; and in this branch no decline has been observed. The manufacture of earthenware is very extensive throughout Persia, and some of its products almost rival the porcelain of China. These, with shawls made from the goats' wool of Kerman, leather, paper, and jewellery, complete the list of her principal manufactures.

3935. *Persia is not a mining country*. Nature has not been bountiful in this respect, and art has done nothing to improve the little she has bestowed. Considerable quantities of copper are drawn from the mines of Mazanderan and Kerman; but those of iron and silver are neglected; for the silver mines of Maden now belong to the Turks. Salt is only too abundant; for a great part of the surface, whenever left to itself, is covered with a saline crust, which renders it unfit for vegetation. Persia abounds, however, with those fat and oily minerals which in other countries are rare. Bitumen and naphtha are found in all the countries bordering on the lower Euphrates and the Tigris; they serve as cement, as pitch for lining the bottoms of vessels, and as a substitute for oil in lamps. A small quantity of a species of black liquid petroleum flows from a rock in Kerman, which is made a royal monopoly. The king also claims the right of selecting the best from among the turquoises of Khorassan.

3936. *The foreign trade of Persia* may be described in few words. The Caspian, besides its difficult navigation, communicates solely with the south of Russia; and the spirited attempts of the English to open a trade across so many natural obstacles had no result. In the Persian Gulf, the splendid settlement of the Portuguese on Ormus was only temporary;

and since Persia lost the countries on the Euphrates, she can obtain Indian commodities only by the ports of Bushire and Gombroon.

SECT. VI. *Civil and Social State.*

3937. *The actual population of modern Persia* was guessed by Chardin at 40,000,000; but this number is considered by all to be beyond the truth, at least in the present day. Among geographical writers, Pinkerton hazards the estimate of 10,000,000 for the whole, including Candahar; Malte-Brun that of 6,000,000, or 8,000,000 for Western, and the same number for Eastern, Persia. We should suspect both these estimates to be under the truth. Mr. Elphinstone, founding on an estimate which, though conjectural, seems to have been carefully made, conceives the kingdom of Cabul, independent of its Indian possessions, to contain 8,300,000; and if this rugged mountain territory, interspersed with huge deserts, hold such an amount, imperial Persia, of considerably greater extent, and containing fertile and highly cultivated plains, ought, after all its losses, to maintain a greater. We should think 12,000,000 nearer the truth, which, after all, would not make one third of the density of England. It would nearly agree with Mr. Kinneir's idea of 18,000,000 or 20,000,000 for the whole country between the Euphrates and the Indus.

3938. *The physical character of the Persians* is fine both as to strength and beauty, but without possessing any very marked features. So many migratory nations have settled in the country, that it retains only a fragment of its native race. The complexion, according to the climate, varies from an olive tint to a deep brown.

3939. *In disposition*, the Persians, with a portion of the grave exterior peculiar to the Orientals, manifest a *disposition* considerably different. They are gay, lively, and animated, and have even been termed the Parisians of Asia. It seems to be their principle to "take the world lightly." This prevailing *gaieté de cœur* and courtesy of manner render the society of the higher ranks particularly amiable, while that of the lower is at least free from rudeness. The humblest peasant, from the old man to the boy, expresses himself with civility. They seem to understand the administration of flattery better than perhaps any other nation; and, besides directly lavishing hyperbolical compliments, take the most delicate circuitous modes of inducing the belief that their sentiments are sincere. The stranger, however, who, from these flattering appearances, has conceived the most favourable idea of the Persians, soon finds, on a nearer intercourse, that "they are mere whitened sepulchres;" that the most profound dissimulation, and the grossest falsehood, mark their whole conduct; and that self-interest almost universally is the sole spring of action. Thus avarice impels them to over-reaching extortion, and all despicable modes of collecting money; while the tyranny of the government drives them to the subtlest expedients for its concealment. At the same time, they are represented by Chardin as the greatest spendthrifts in the world; exhibiting in their dress, their houses, and their harems, a splendour beyond their fortune. They were observed to take a peculiar latitude relative to that precept of the Koran which forbids the use of wine; but the present emperor, who is a rigid Mahometan, has suppressed these convivial habits, and has compelled all prone to indulge in toping to "drain by themselves, bowl after bowl."

3940. *In regard to their faith*, the Persians adhere to that grand Mahometan schism, at the head of which was Ali, the son-in-law of Mahomet; and, on account of some trifling distinctions, they and the Turks, who are followers of Omar, mutually doom each other to everlasting perdition. The political rivalry of the two nations has, no doubt, tended to embitter this enmity. In other respects, the Persians display little of that bigoted and persecuting spirit which reigns among the nations by whom the Mahometan faith is professed. Europeans, in passing through the country, are not treated as objects of horror and opprobrium; and even the long and cruel persecution practised against the Guebres, or ancient worshippers of fire, by which that unfortunate race was almost exterminated, has now ceased. About 4000 of them reside unmolested in Yezd and in other cities of Kerman.

3941. *The Persians are the most literary people* among the Asiatics, at least of modern times. Poetry, in particular, is a ruling passion; and Hafiz, Sadi, and Ferdusi, have displayed an Oriental softness and luxuriance of imagery, which have been admired, even in European translations. Ferdusi is the epic poet of Persia; the theme of Sadi is wisdom and morality; while Hafiz has strung only the lyre of love. The latter is the most popular poet, though strict Mahometans scarcely consider it lawful to peruse his verses, unless after straining them into a refined and mystical sense. The monotony of Eastern manners, especially in what regards the female sex, precludes that variety of scenes and situations which give interest to the love stories of Europe. Elaborate descriptions of the beauties of the beloved object, of the miseries of absence, and the joys of presence, are expressed in those hyperbolical terms and that flowery imagery peculiar to the Oriental writers. The present emperor has a poet in constant attendance, whom he extolled to the English embassy as superior to any other bard of the age, and even to any on earth; and, not contenting himself with empty praise, gave him a gold tomaun, nearly two pounds sterling, for every

couplet. As no specimens, however, have been produced of the works of this modern Hafiz, we cannot estimate the real value of these extravagant plaudits.

3942. *The sciences* have also been cultivated in Persia with ardour; and considerable assiduity is still shown in the prosecution of them; but the splendid establishments by which they were supported are in utter decay. The present king is doing all in his power to revive the study of the sciences formerly cultivated. Morals, however negligently practised, are an object of diligent study; as are also geometry, arithmetic, the Turkish and Arabic languages, but above all medicine and astrology, which last is the high road to fame and fortune. Europeans, on account of their ignorance of this vaunted science, are held in contempt. According to an old writer, 400,000*l.* were annually spent on its fallacious professors; and though the sum is doubtless much smaller at present, the craft of divination is not the less esteemed.

3943. *Persia contains fragments of several ancient languages*, of which the Zend is known only by the Zendavesta, a religious work preserved by the Guebres, but of which the authenticity and antiquity are a subject of controversy. The Pehlevi appears to have been the court language of Persia during the period of its connection with Greece and Rome. Under the dynasty of the Sassanides, the preference was given to the Persic, the dialect of their native province of Fars. This language having been enriched by a mixture of Arabic introduced by the Saracen conquerors, and polished by a succession of great writers, who made it the vehicle of their effusions, has become the most refined and classic in the East, and is spoken not only at the Persian court, but at the Mahometan courts of Hindostan. Its close alliances with all the branches of the Teutonic, and with the ancient Greek and Latin, have afforded ample ground to exercise the ingenuity of the etymologist. Meantime the Turkish, introduced by the irruption of the Turks from Western Tartary, and implanted during their temporary dominion, is spoken extensively among the people.

3944. *The Persians*, as already observed, surpass in pomp the other Oriental nations. This magnificence with them, as with the others, does not display itself in houses and furniture. The mansions even of the richest present to the street only dead walls of clay, and a

581

PERSIAN KHAN.

mean door, leading to a large interior court, into which all the apartments open. These apartments are spacious and commodious; but they contain scarcely any furniture, except carpets, on which the owners sleep, sit, eat, and pass the greater portion of their lives. Their dishes are merely trays of painted wood, or copper tinned. Their baths, paved with marble, open to the sky, and furnished with every provision for magnificence and coolness, are also their favourite resorts for pastime. The Persians are splendid in their attire (*fig. 581.*). Gold, silver, and precious stones, proscribed by the Turks, are lavished by them on their head-dress, their robes, and particularly their sabres, many of which are thus raised in value to 15,000 to 30,000 piastres. The beard, highly respected over all the East, is viewed by the Persians with peculiar veneration: they spare no pains in embellishing it, in making it thick and tufted; they even adorn it with jewels.

Their horses are the objects of still greater attention. Even a man who has not clothes worth half a guinea will have a good horse.

3945. *The women of rank* wrap multiplied folds of silk round their heads, and wear long floating robes; nor do they ever appear in public without long veils (*fig. 582.*). The harems of the great are filled, as over all the East, by negotiation with the family of the bride, and by the purchase of Georgian and Circassian slaves. From the lavish use of the warm bath, or from some other improper regimen, the beauty of the fair sex is of very short duration. "In eight or ten years," says Porter, "the lately luxuriant and sportive beauty becomes thin, withered, rheum-eyed, and every way a hag." The son takes precedence entirely according to his father's rank: as to the mother, whether she have been wife, concubine, or slave is considered a matter of indifference.

3946. *The Persians are simple in eating*, and use little animal food. Pilau, or rice stewed with various ingredients, forms their favourite dish. The chief luxury of their table consists in a profusion of the finest fruits.

582

WOMAN OF RANK.

SECT. VII. Local Geography.

3947. *In fixing the difficult boundaries of the Persian empire*, we shall continue to include *Shirwan*, because its separation is not complete, nor perhaps finally decided. Shirwan consists chiefly of a fertile plain, arched round, as it were, by the mighty chains of Caucasus. The Kur forms its southern boundary. Being watered

by numerous streams, it produces plentifully cotton, rice, wine, and fruits. There is, however, a flat track along the sea-coast, which is nearly desert. Shamachie is reckoned the capital, and old Shamachie, of which only the ruins, over-run with brushwood, can now be traced, was a large and populous city. New Shamachie, built of unburnt brick, and surrounded by a broad ditch, was supposed in 1795 to contain 5000 or 6000 inhabitants, when it was taken and reduced to ashes by Mahommed Aga, a calamity from which it has not fully recovered. Baku, from its trade, and its situation on the Caspian, is of more modern importance. In the plain to the south-east are found inexhaustible pits of naphtha, which yield upwards of 1000 pounds weight a day, and which begin to fill as soon as they are emptied. Near Baku is the plain of fire; a spot from which an inflammable gas continually issues, producing a blue flame. This plain, to the extent of about a mile in circumference, had been walled round, was a place of great resort, and held in deep veneration by the ancient Guebres. All the ground to a great distance round Baku is, as it were, impregnated with this fire, which is sometimes seen rolling in streams down the mountains. Kuba, a small well fortified town, is the residence of a khan, whose sway extends over a very fertile and populous district, called, from one of its admired productions, "the paradise of roses."

3948. *After passing the Kur, we enter Ghilan*, a long narrow province, formed of a plain which extends 200 miles along the Caspian, and is bounded inland by a range of mountains which can be penetrated only by a few narrow passes. There is no river of any magnitude except the Kizil-Ouzen, which, after traversing a considerable part of Persia, forms the boundary between this province and Mazanderan. Numberless streams, however, descending from these mountains to the Caspian, maintain an almost excessive richness of vegetation; for the fruits, though in the greatest profusion, are considered unwholesome. Reshd, the capital, is described by Mr. Frazer as a flourishing commercial city, having from 60,000 to 80,000 inhabitants, with well kept bazaars, but abounding in beggars. As its harbour is unsafe in stormy weather, many prefer the smaller port of Lankeroon, situated to the north-west. Large crops of wheat, rice, and other grain, cover the fields; but the staple production is silk, which is either worked up within the province, or exported to Astrachan. The air is rendered very unhealthy, by excessive moisture, with which it is so impregnated, that metallic instruments can scarcely be preserved from rust. From its mountain streams, and luxuriant verdure, Ghilan exhibits the most beautiful and romantic sites even in this picturesque empire.

3949. To the west of Ghilan is *Aderbijan*, or *Azerbijaun*, also encircled by mountains: on the north those of Armenia, while on the south those of Koordistaun, in an accumulated mass, raise their towering heads to the clouds. This province is traversed by numerous smaller hills, and being well watered by the Araxes, Kizil-Ouzen, and other streams, is one of the pleasantest and most fertile regions of Persia, though the prosperity of the people is much depressed by the tyranny of their rulers. No city in Persia was more illustrious than Tabreez, or Tauris, both as a splendid capital and a seat of commerce; and in the time of Chardin it was supposed to contain 500,000 inhabitants. Nature and man have co-operated in its destruction. It has been sacked eight different times, and has been shattered by repeated and dreadful earthquakes. Of the 250 mosques numbered by Chardin, only three could be traced by Sir R. K. Porter. That of Ali Shah, 600 years old, still retains traces of the greatest magnificence, being cased with lacquered tiles of porcelain, disposed and adjusted into intricate and elaborate figures, and surrounded with a complete band of gilded Arabic sentences, embellished with flowers in green and gold. There is also a splendid tomb of Sultan Cazan, without the city. Ardebil, a fine old town, and a seat of the shahs, is likewise much declined. Between it and the Kur is the plain of Mogam. The eastern part forms a picturesque and flourishing district, surrounding the lake of Urumea, which is about 300 miles round, salt like the sea, emitting a sulphurous smell, and of such quality that fish cannot live in it. Urumea, the reputed birth-place of Zoroaster; and Maragha, the favourite residence of Holaku, where that great prince built his famous observatory, are ancient and still flourishing towns.

3950. *Mazanderan* forms on an extended scale the continuation of the small line of plain, backed by mountains, and is the southern boundary of the Caspian. The wheat is not good, and silk is not cultivated to the same extent as in Ghilan; but rice is raised in vast quantities, and the sugar cane abounds. It is, too, a very picturesque province, and, moreover, the seat of a brisk trade. It is unhealthy, not quite so much so as Ghilan, though from the same causes. Its southern boundary is Mount Elburz, which stretches along the whole length of the province, and eastward into Khorassan. Demavend, forming its loftiest peak, is situated in a district called Tabrestan, and across it is that long defile called the Caspian Gates, leading from Teheran to Amul.

3951. *Mazanderan contains a number of pretty little cities.* Lari, the residence of the governor, is small, but well fortified and very ancient, containing several lofty temples of the early Guebres. Balfroosh, however, is the largest town, and carries on a very extensive commerce. Enjoying free trade, and having been protected by a wise governor from the revolutions which were laying waste other parts of Persia, it has lately flourished in an extraordinary degree, and is reckoned by Mr. Frazer to contain 20,000 people. It is but meanly built, however, in a low damp valley, about a mile and a half in circumference. Amol is a very old town, celebrated for its bridge, and containing a manufactory of iron. The population is stated at 35,000 or 40,000; but a great proportion consists of shepherds, who in the summer go up to the mountains. Ferabad and Meshed are agreeable sea-ports, with some trade. Ashraff, which Abbas attempted to make a naval arsenal, and at which he built a magnificent palace, has since his time fallen into neglect. The most eastern part of Mazanderan is composed of the agreeable district of Astrabad, the ancient Hyrcania, and sometimes reckoned a separate province. The town has some silk and woollen manufactures, and carries on a commercial intercourse between Turkey and Persia. From its vicinity to the turbulent race of Turcomans, it has often been the seat of insurrection. To the east is Jorjan, the ancient Hurkaun, still a very strong fortress, celebrated in the wars between Persia and Tartary.

3952. *Eastward from Mazanderan is Khorassan*, the most extensive province of Persia, from whence that empire passes insensibly into the boundless plains of Independent Tartary. During the late weak and distracted state of the monarchy, this liminary province has been in a great measure alienated. The Afghans hold Herat, now the most populous of its cities; and the king of Bochara holds the north-eastern districts. Not content with this acquisition, he makes, with his swarms of irregular horse, continual inroads into the rest of the province, lays waste the country, and carries off the inhabitants as slaves. These desolations have converted Khorassan, from one of the most fruitful regions in the world, almost into a desert. It appears nothing uncommon, when the gates of a city are opened in the morning, for a body of Tartar horse, which has been lying in ambush, to rush in, set fire to the town, and carry off the inhabitants into slavery.

3953. *Meshed* is considered the capital of Khorassan. It is a large and strongly fortified city, situated in a fine plain, and distinguished by the superb sepulchre of Haroun Alraschid. Though much decayed, it still numbers 50,000 inhabitants. To the south, Nishapour, once a splendid capital of Persia, and continually rising anew, after its destruction by Alexander, by the Arabs, and by the Tartars, was, when it had become the capital of the Turkish princes of the Seljuk dynasty, so completely destroyed by Zingis Khan, that the inhabitants, on returning, could not recognise their own houses. Its 12,000 aqueducts are now dry, and its population, occupying a mere corner beyond its former circumference of twenty miles, are reduced to 15,000. Tursheez, Tubbus, Serukhs, Tabas, are large towns with some trade, still included in the Persian dominion. Herat, now comprised in the Afghan domain, is the finest city in Khorassan. It is situated in an extensive, somewhat elevated, but most fertile plain, which produces wheat, barley, and fruits in the greatest abundance. It is the emporium of the trade between Persia and the East, which is carried on chiefly by 10,000 Jews and 600 Hindoos who inhabit the city. *Meru-Shah-Jehan*, the principal town of the Tartar division of Khorassan, is governed by a brother of the king of Bochara. Among the many ephemeral capitals of Persia, none surpassed the fame of this city when it was the residence of Alp Arslan, the most powerful prince of his time. By the vicissitudes of war, and the devastations of the Uzbecks, it has been almost annihilated.

3954. *Having disposed of these northern divisions, we come to Irak, the grand central province*, which forms, as it were, the body of Persia. It is understood to have composed the ancient Media. This province is almost

entirely traversed by chains of mountains, with long valleys intervening, from ten to fifteen miles in breadth. The mountains are naked and barren; but the valleys would amply repay the highest culture, were it not for the desolation brought on them by civil war and misrule. Indeed, in the most deserted tracts, the ruins of cities and aqueducts still indicate their former prosperity, which part of them, under the management of an enlightened governor, are beginning to recover. The eastern part of this province, with the adjoining tract of Khorassan, is occupied by a salt desert of great extent.

3955. *Irak* is, as it were, covered with splendid cities and celebrated capitals, most of them in a state of ruin, from which a few are beginning to rise. Among these, Ispahan, or Spahawn (*fig. 583.*), stands pre-eminent. By the caliphs of Bagdad it was made the

ISPAHAN.

capital of Persia; and being placed in the centre of the empire, surrounded by a fertile and beautiful plain, it became a rendezvous of the inland commerce of Asia, and attained an extent and splendour unrivalled in Western Asia. It was destroyed by Timur, but restored by Shah Abbas. Chardin reckoned that in his time it was twenty-four miles in circuit, contained 172 mosques, 48 colleges, and 1800 caravanserais. The most magnificent

edifice was the palace, the gardens attached to which occupied a space of five miles in circumference, and were interspersed with the most splendid pavilions. The Meydun, a square, serving for military reviews and for a market-place, round which were built the palace, and a number of splendid mosques; with the Chaur Baug, a long avenue of plane trees, were also distinguished ornaments of Ispahan. The Zenderood, a fine river, giving fertility to the plain of Ispahan, which it is expended in irrigating, traverses the city, is conducted through its gardens and pastures, and crossed by several magnificent bridges. This magnificence of the public structures is combined, as usual in Asia, with meanness and wretchedness in the streets, and in the huts occupied by the mass of the people. In 1722, it was taken and almost destroyed by the Afghans, and, the later sovereigns having preferred a northern residence, no exertions have been made for its restoration. A man may now ride through it for miles without seeing an inhabited house; only three colleges are open; and its proudest edifices present only piles of rubbish. It is still, however, a great city, with extensive trade, and some flourishing manufactures, particularly of gold brocade. Hussein Khan, a native, who has raised himself to extraordinary wealth, is making great efforts to revive its magnificence.

3956. *Teheran* (*fig. 584.*), founded by Kurreem Khan, is situated at the northern extremity of *Irak* proper, at the foot of the loftiest mountains of Elburz. The two last sovereigns have made it their residence, in consequence of its vicinity to the Russian frontier,

TEHERAN.

the theatre of almost perpetual war. It is four miles in circumference, strongly fortified, and rather a camp than a city. It has no grand edifices except the *ark*, combining the character of a palace and of a citadel. In summer the place becomes so extremely unhealthy, that all leave it who can. The king with the troops, and the chiefs with all their trains, depart, and encamp on the plains of Sultania. The population of the city thus varies, according to the season, from 10,000 to 60,000. Adjacent to Teheran are the remnants of the ancient Rhaiz, mentioned as a spot to which the Jews were conveyed after the Babylonish captivity. It continued a great city till destroyed by the generals of Zengis Khan. The remains are of sunburnt brick, and the whole surface for three miles in every direction is marked by hollows, mounds, mouldering towers, tombs, and wells.

3597. *Among all the fallen capitals of Persia, none lie so low as Sultania.* Its broken arches and mouldering remains, displaying all the pomp of Oriental architecture, are mixed with a few cottages of peasants, inhabited by about 300 families. There is in particular a grand unfinished mosque, in the interior of which the whole Koran is written in ornamented characters. The prince royal has begun to erect a citadel, to be called Sultanabad, and will probably do something for the repair of the place. *Casbin*, or *Casween*, though it has lost its grandeur as a capital, is still a neat flourishing city with a considerable trade. *Koom*, on the contrary, is described as a large straggling wilderness of ruins, all crumbling and tumbled into heaps. It has, however, been in part rebuilt; and the modern structures are confusedly mixed with the ancient. A road along the great salt desert leads from *Koom* to *Cashan*, a city still very flourishing, particularly by its manufactures of silk brocade. It commands a magnificent view of the mountains of *Taurus*.

3958. *The western part of Irak* is mountainous and irregular, though still interspersed with rich plains. Here occurs *Hamadan*, supposed the ancient *Ecbatana*, and presenting, in fact, the appearance of great antiquity. It is still large; though, since its destruction by *Timur*, it has never held more than a secondary rank. It is finely situated near the lofty peak of *Elwund*, but suffers under extreme cold during eight months of the year. Still farther west is *Kermanshah*, a large and flourishing town, bounded by a long range of mountains. Those to the north present some remarkable sculptured rocks. *Besittoon* forms a high and perpendicular rock, cut smooth on one side, and impending over the road like a canopy. In one of its most inaccessible points is sculptured a group of figures representing a procession. *Taki Bostan* is a more remarkable feature, and presents a series of excavations made in these mountains; the most considerable of which is an arch cut in the rock, fifty or sixty feet in height, and twenty-four feet wide. The figures represented are numerous, executed with great precision and judgment, in a manner which *Mr. Kinneir* conceives would not have disgraced the finest artists of Greece and Rome. They are very similar to those of *Persepolis*, and, though ascribed by some to *Semiramis*, seem traced, on much more solid grounds, by *M. de Sacy*, to the *Sassanian* dynasty.

3959. *The south-eastern part of Irak* is arid and poor; yet it contains the large city of *Yezd*, still flourishing as a seat of commerce, and of a valuable silk manufactory. It contains the remnant, amounting to about 16,000, of the persecuted race of the *Guebres*. *Yezdikhist*, the most southern town, is of some consequence, from its situation on the high road from *Ispahan* to *Shiraz*.

3960. *To the north of Irak* is *Fars*, a province of much less extent, but interesting, as it composes that territory which was originally called *Persia*, and whose hardy inhabitants subverted the kingdoms of *Media* and *Babylon*. Its western part consists of chains of lofty mountains, forming part of that great range which extends from *Caucasus* to the *Persian Gulf*, and with fertile though often neglected valleys interspersed. The eastern part is a large plain, often sandy and arid, but, when supplied with water, very fertile, particularly in tobacco.

3961. *Shiraz*, or *Shirauz*, though neither very ancient nor very extensive, has long been one of the boasts of *Persia*, from the beauty of its environs, and the polished gaiety of its inhabitants. It has been the favourite seat of the *Persian* muses, and near it are still to be found the tombs of *Hafiz* and *Saadi*, the chief of the national poets. Its wines are celebrated as the most valuable in the East; and it is the seat of a considerable and increasing trade; but since it ceased to be the residence of *Kurreem Khan*, the inhabitants have lost their character for taste and refinement. The latest travellers have found the romantic spots, so celebrated by *Hafiz*, abandoned to decay. The bower of *Mossella* was desolate, and the pure waters of *Rocknabad* choked with rubbish. The tomb of the poet was surrounded by common graves, and no longer adorned with a copy of his poems. That of *Saadi*, situated in the hills, at the distance of two or three miles, was equally neglected.

3962. *Near Shiraz* is the large salt lake of *Baktegaun*, from which a great part of *Persia* is supplied with salt of a peculiarly fine quality. To the north, along the road to *Ispahan*, are the plains of *Oojaun* and *Kooshkyjerd*, which, though now in a great measure abandoned to the wandering tribes, are still capable of becoming again the garden of *Persia*.

3963. *The only other place of much consequence* in this province is *Bushire*, or *Abu Shehr*, which, since the empire lost *Bassora*, has been the emporium of its foreign trade. This is chiefly with *India*; and it is not sufficient to render the town either large or handsome. Large vessels cannot anchor nearer than six miles, in a roadstead which, though good, is not perfectly safe in north-west winds.

585

PERSEPOLIS.

3964. *The grandest feature of this province, however, consists in its ancient remains, which far surpass any that are to be found in the northern capitals.* Thirty miles to the south of *Shiraz* are found the remains of the palace of *Persepolis* (*fig. 585.*), one of the most magni-

ificent structures which art ever reared. Its front is 600 paces in length, and the side 390 paces. The architecture is in a peculiar style, but remarkable for correct proportions and beautiful execution. The staircases leading into the interior are peculiarly extensive and magnificent. The portals and the capitals of the columns are adorned with numerous figures in basso-rilievo, representing combats and processions of various kinds. The drawing of the figures is correct; but as only their contour is represented, without any of the prominences and details, they present a heavy appearance, and cannot rival the great works of Grecian sculpture.

3965. A few miles to the south of Persepolis we discover a remarkable feature, the excavated hill of *Nakshi Roustan* (fig. 586.). It is about 300 yards high, and presents a precipitous

NAKSHI ROUSTAN.

face of whitish marble, nearly the whole of which is covered with sculptured tombs. The four highest are in a superior style of execution, apparently coeval with Persepolis, and belonging to the early kings of Persia. The lower tombs appear to belong to the Parthian Sassanide dynasties, and represent their wars with the Romans and Tartars. Near Murgab, ninety miles north of Persepolis, are two remarkable objects. One of them, called Tuckt-y-Sulieman, consists of a large marble structure raised in the face of a hill, and forming a platform at top. It is supposed to mark the site of Pasagardæ, the city of the Magi, for the celebration of whose rites the platform appears to have been

raised. The other, called Madre-y-Sulieman, for the Asiatics ascribe every thing to Solomon, appears proved to be the tomb of Cyrus. A large flight of marble steps rises to the tomb itself, which is in the form of a house.

3966. At the end of the long valley in which Kazeroon is situated are found the magnificent remains of *Shahpoor*, founded before the time of Alexander, but restored and embellished by Sapor the Great. It lies in a wild romantic spot, on the banks of a rapid river, amid rocks and precipices. Several of these rocks are covered with sculptured monuments, representing the triumphs of the second founder of Shahpoor. His colossal statue, fifteen feet six inches long, lying on a cavern, has been recently described by Ouseley. The circuit of the ramparts, and the remains of several public buildings, may still be traced.

3967. To the south of Fars is the small maritime province of *Lar*. The interior is extremely arid, producing only dates, with a small quantity of grain. Lar, however, was once a magnificent city, though now much decayed; and Taron, though poor, carries on a considerable inland trade. The sea-ports are now in the hands of the Arabs, who combine trade and piracy. The largest sea-port is Congoon.

3968. To the east of Fars is the province of *Kerman*, presenting arid mountains, and interspersed with extensive tracts of desert; but in others capable of high cultivation. Its hilly tracts are distinguished by a species of goats with hair, or rather wool, of peculiar fineness. Kerman, the capital, was one of the proudest cities in the empire, till, in the course of the civil wars, having afforded shelter to a pretender to the throne, it was taken and destroyed by Aga Mohammed. From this blow it has never recovered, though it still retains considerable trade and population, and is celebrated for its manufacture of shawls and carpets. Bumm, an important city, also decayed, and Regan, a neat little town, are both situated on the eastern frontier, and strongly fortified. On the sea-coast this province has Gombroon, which Shah Abbas, after destroying Ormus, rendered the emporium of Persian commerce. It now belongs to the Imam of Muscat, and, with Minab, a large fortified sea-port to the east, yields customs to the amount of 20,000 rupees annually. Opposite to Gombroon is Ormus, no longer the seat of that vast commerce which, in the days of Albuquerque, rendered it one of the most splendid cities of the East. When it came into the hands of the Imam it did not contain twenty houses, but he has in some degree restored it. Every thing of the old city is in ruins except the reservoirs. Adjoining is the large and fertile island of Kishme, containing a town of some magnitude.

3969. As Kerman forms the eastern, *Khusistan* forms the western portion of Persia. This province exhibits a complete contrast to that aridity which dooms so great a portion of the kingdom to barrenness. It is watered by four fine rivers, the Kerah, the Karoon, the Teraki, and the Endian, which fall into the Tigris and the Persian Gulf. With these advantages it might regain the distinction, which it formerly enjoyed under the name of Susiana, of being one of the most fertile regions in the world, were it not entirely laid waste by anarchy and misrule. The southern and maritime part belongs to the chief sheik, an Arabian prince, whose capital is at Dorak. The Persian part, called Shuster, is under a governor, whose power, however, is insufficient to restrain the predatory tribes and independent chiefs, who make this country a scene of perpetual confusion. The capital, Shuster, is a place of some importance, containing considerable woollen manufactures. On its site are extensive ruins, which have been supposed to be those of Susa; but these have, with greater probability, been traced to a spot called Shus, on the upper Kerah, where, for a space of twelve miles in length, the ground, as at Babylon, is covered with hillocks of earth, rubbish, and broken bricks. It is now a gloomy wilderness, infested by lions, hyenas, and other beasts of prey. The desolation of this fine province is strongly marked by the ruins of Ahwaz on the Caroon, which, under the protection afforded by the powerful dynasty of the Abbassides, became one of the greatest cities of the East. The water of the river was almost entirely employed to irrigate the surrounding country, which, now overgrown with wood, was then covered with the richest plantations. The site, ten or twelve miles in length, and half that breadth, is covered with vast mounds of bricks and rubbish, and of which Captain Mignan conceives there might be built as large a city as any that now exists. The inhabitants of the modern village, about 1600 in number on searching the ruins after a fall of rain, seldom fail to discover gold and silver coins, medals, and sculptures.

3970. Besides these provinces, belonging entirely to Persia, there are two which she divides with Turkey, and which have long formed the theatre of contest between the empires. One of these is Koordistan, the ancient Carduchia, inhabited by a brave, hospitable, fierce, and turbulent race; who are described as such by Xenophon, and appear never to have been changed or thoroughly subdued. The eastern part, called Ardelan,

is, in so far, subject to the Persian monarch, that the inhabitants pay a small tribute, and are ever ready, at his call, to engage in their favourite pursuits of war and plunder. The country consists entirely of ranges of rocky mountains and high table-lands, traversed by difficult and often perilous routes. They are governed in a despotic but mild manner by hereditary chiefs. The principal of these, called the Wallee, resides at Senna, the only town of much importance, situated in a fine valley, and carrying on some trade.

3971. *Another divided province*, long a theatre of contest between the East and the West, is the ancient kingdom of Armenia. The lofty mountains of Western Asia have their central place in this region. As, however, it contains numerous valleys, watered by the early streams of the Euphrates, the Tigris, and the Araxes, it is well adapted for cultivation. A great part of it, however, having long been the theatre of constant war between Persia, Russia, and Turkey, has become a vast depopulated wilderness, and presents the remains of cities, towns, and villages, that belonged to a flourishing people, now swept from the face of the earth; a border land or high road, through which the Asiatic powers pass in open war or predatory hostility. For three centuries, however, Erzeroum, Diarbekir, with the finest and most fertile tracts, have belonged to Turkey. In the Persian division, the chief town is now Erivan, a strong fortress, situated on a precipitous rock, over the river Tergui. In 1808, the Russians were driven from it after a blockade of six months; but the repeated sieges sustained by it have greatly impaired the prosperity of Erivan. Fifty miles distant are the remains of Nackshivan, an ancient and magnificent city, now reduced to a heap of ruins. Near this spot the Persian camp is usually pitched in the campaigns against Russia.

CHAP. V.

INDEPENDENT PERSIA.

3972. *The large region to which we have given the name of Independent Persia* forms rather an aggregate of various territories than a distinct or connected kingdom. For the reasons already given, we have separated it from the empire of Persia, and have included in it the provinces of Seistan and Mekran, which never formed any regular part of that empire. Cabul, till lately the seat of the only important monarchy in this region, has been very commonly considered as a province of Hindostan; and, indeed, the cities of Cabul and Ghizni were the residence of celebrated dynasties which reigned over that empire: but its moral and physical character is entirely distinct, and the ties which unite them are altogether precarious. The kingdom of Cabul is now dismembered, and a great part of it is in the possession of Runjeet Sing, the Seik ruler; yet the Indus forms too natural a boundary to be superseded by any temporary changes of this nature. For the same reason, though Ahmed Shah held sway over Balkh, the mountains form still the natural limit between Independent Persia and Tartary.

SECT. I. *General Outline and Aspect.*

3973. *Upon the principles above stated, Independent Persia will be comprehended* within the marked natural boundaries formed by the mighty chain of Caucasus, or Hindoo Koosh, on the north; by the Indus on the east; the Indian Ocean on the south; and, on the west, by a winding line drawn along the desert boundaries of Kerman and Khorassan. It will thus, in a general view, be included within the 57th and 71st degrees of east longitude, and the 25th and 36th of north latitude. It forms nearly a square of about 800 miles in length and 700 in breadth.

3974. *This region presents a sort of compound of Persia and Arabia*: on the north, vast mountains, high table-lands, and rapid rivers; on the south, sandy and salt deserts. The most conspicuous feature is that grand mountain chain, continued from the snowy range of Hindostan, which forms the whole of its northern boundary. Though its height does not equal that of the loftiest peaks of the Himalayah, it is yet truly amazing, and scarcely paralleled in any other region of the globe. One point, the most elevated yet observed, has been stated to reach 20,593 feet. Its summits, though only in the 34th degree of latitude, are covered with perpetual snow; and being seen at once from the whole extent of this region, form, as it were, a bond of connection between the various nations by which it is peopled. From numerous accounts, not yet perhaps very accurately combined, it is supposed to extend without interruption westward till it locks in with Mount Elburz, and thus connects itself with Taurus and Russian Caucasus. That part which rises above the plain of Cabul is, from a peculiarly elevated peak, called generally Hindoo Coosh, or Hindoo Koh. In its progress westward, it takes, or at least it received from the ancients, the name of Paropamisus. Here its elevation is considerably less, and it is not covered with perpetual snow. Ranges proceeding from this main one, or connected with it, traverse in every direction the territory of Cabul and Candahar. Of these the most important is that of Solimaun, which runs parallel to the Indus, and nearly at right angles with the Hindoo Coosh, leaving behind them, near its highest peak of Suffaid Koh, only a narrow pass, through which flows the Kama. The intervening territories are to be considered not properly as plains, but as elevated table-lands, yielding the products rather of the temperate than of the tropical climates. The southern regions, Seistan, Beloochistan, and Mekran, consist partly

of rugged mountains of inferior elevation; partly of vast deserts which are equally dreary with those of Africa and Arabia, and of which the sands, being blown into waves, oppose greater obstruction to the traveller.

3975. *The rivers of Eastern Persia*, unless we include among them the liminary stream of the Indus, are not of the first magnitude. The Kama rises beyond its limits in the territory of Kaushkaur, and, after crossing the Hindoo Koosh, and receiving the river of Cabul, which rises in the southern part of that chain, falls into the Indus at Attock. The Heermund derives its origin from a source not far from that of the Cabul; it traverses the plain of Candahar, and, giving some degree of fertility to the arid plains of Seistan, terminates by forming the salt lake of Zerrah, or Zurrah. It must have flowed then nearly 600 miles. The mountain tracts in the south give rise to numerous rivers, or rather torrents, nearly dry in summer, but rapid and desolating in winter.

SECT. II. *Natural Geography.*

3976. The Geology of this region has not yet been explored; and its Zoology does not differ from that of the Persian empire. The following remarks occur in relation to its Botany.

SUBSECT. 1. *Botany.*

3977. *This country*, which extends from the extremity of the Himalayah mountains to the western frontier of Beloochistan, and from the mouth of the Indus (lat. 24°) to the shores of the Oxus (lat. 37°), is very little known. The famous districts of Cashmere, Cabul, and Candahar find more place in the marvellous tales of Arabian writers than they do in the more dry and learned disquisitions of European naturalists.

3978. *The southern part of the great desert* is not so sterile but that traces of the vegetation of hot countries may be perceived. Here and there, among the drifted sands which heave like the waves of the ocean, grow scattered tufts of dry plants, and bushes of Mimosa and Zizyphus. The *Holcus spicatus* (fig. 587.) is cultivated round some lonely huts; and it is a circumstance worthy of remark, that the inhabitants of these wild abodes are obliged, in their search for water, to dig to a depth of 300 feet, in a soil whose arid surface produces, without any cultivation, Water Melons more than a foot in diameter. The rivers Setuleje, Chunab, and Indus, diffuse fertility along their shores in the very heart of this desert.

HOLCUS SPICATUS.

3979. *At its eastern extremity is the province of Sinde*, of which the southern part, bathed by the sea of Oman to the westward, descends to the tropics. The shore presents a large level plain, which is intersected by the Indus, and the various channels which convey the waters of that river to the sea. The shores of this fine stream are remarkably fertile; but so soon as the traveller goes to a short distance from them, he finds on one hand the desert, and on the other a range of bare

mountains, that offer a striking resemblance to Egypt, as is remarked by Pottinger. At Tattah (lat. $24^{\circ} 44'$), this traveller remarks that, from the middle of June to the middle of

EUPHORBIA ANTIQUORUM.

July, 1810, the thermometer, in the coolest apartments, never fell lower than from $+ 38^{\circ}$ to $+ 33^{\circ}$; and that at Hyderabad (lat. $25^{\circ} 22'$), in August, the rainy season, it rarely sank below $+ 38^{\circ}$. Among the plants of this country, we can only point out the Mimosas, the Tamarix, and the *Euphorbia antiquorum* (fig. 588.). The same may be said of Seistan, reputed to be the warmest province of the empire.

3980. *The annual temperature of the shores of Beloochistan* must be inferior to that of Sinde, because the year is there clearly divided into two seasons, the warm and the cold; but it is requisite to observe, that this latter season only appears cold when compared with the excessive heats of the former. The soil is only fertile where it is irrigated, and elsewhere is as sandy as the desert. It produces the Date, the Pride of India (*Melia Azedarach*), the Banyan (*Ficus religiosa*), the Dalbergia Sissoo, the Mango (*Mangifera indica*), the Tamarind, the Zizyphus, and some Mimosas of considerable stature: the Walnut, the Sycamore, and the Oriental Plane, succeed very well: Ashes, Oaks, and Firs, with the other Coniferæ, are unknown. At a very short distance from the coast, the country becomes mountainous, and the temperature varies with the inequalities of the soil. In the low and favourably situated valleys, between lat. 27° and 30° , grow the Date, the Guava, the Banana, the Fig, the Pistachio, the Mulberry, the Pomegranate, the Vine, the Walnut, the Quince, the Peach, the Apricot, the Almond, the Cherry, and the Currant. Rice, Cotton, and Indigo are cultivated on the plains; but on the slopes and declivities of the hills, where long

winters and severe frosts are experienced, they can hardly reckon with certainty on a slender harvest of wheat and barley; so tardy is the ripening of grain. The ground brings forth spontaneously Mimosa, Tamarix, Hedysarum Alhagi, and Assafœtida.

3981. *Turning towards the north-west*, we enter on the desert of *Kerman*; a burning, arid, and saline sand, quite destitute of vegetation. In the centre of this vast and dreary solitude, some springs of fresh water irrigate the little oasis of Kebis, which gladdens the traveller with the sight of its hospitable roofs, its perennial verdure, and its cooling shade.

3982. *The whole of this empire*, from the desert of *Kerman* to the western declivities of the Himalayah mountains, and from the desert of the south to the Indian Caucasus, and the Paropamisan range, must be included in the Transition Zone, though the accidents of soil often obliterate its distinctive features. Between lat. 30° and lat. 33° , the flat and low districts enjoy a very hot summer, and a remarkably mild winter. Sometimes, in the latter season, a thin coating of ice is formed, during the night, on the surface of still waters and the brink of rivers; but it dissolves at sunrise. Frequently there is a fall of snow in the western districts, but it is never seen at Candahar (lat. 33°). At a considerable distance from this city, to the south-east, in the fertile plains of Moultan (lat. $30^{\circ} 50'$), shaded by the Date, the Melia Azedarach, and the Banyan, Elphinstone remarked, in December, 1809, that the thermometer fell in the morning to $-2^{\circ} 2'$. All the country which stretches from the left bank of the Indus to the Himalayah, and to the southern mountains of Cashmere, enjoys a climate that is warm enough to ripen the fruits of India. The Plane and the Willow become rarer as the latitudes are more low.

3983. *To the north, Cashmere* (lat. 34° to 35°), enclosed between two chains of mountains, whose lofty summits are clothed with perpetual snow, has a cold winter, and a moderately warm summer. Of all the Indian trees, the Mulberry alone succeeds; the fruits of Europe and of the north of Asia Minor, such as Wheat, Barley, and Rice, are cultivated. The mountains are covered with Pine and Fir, particularly on their northern sides; the rivers are fringed with Willows, and the adjacent plains, near the inhabited parts, are adorned with Poplars.

3984. *The valley of the Indus* divides the chain of northern mountains of Cashmere from the Indian Caucasus, which stretches from east to west, and terminates at the commencement of the Paropamisan mountains. Its crest, of which some of the summits attain a height of 3000 toises, is always covered with snow. The lower ranges are skirted with forests of Lentisks (fig. 589.), Pistachio trees, Olives, Oaks, Firs, Pines, &c. In the low valleys grow a multitude of plants belonging to the same genera as those of Europe.

LENTISK.

3985. *To the south of the Indian Caucasus*, and not far from its base, in the valley intersected by the Punjsheer, are two famous towns, Cabul and Peshawer. The latter (lat. 34°), situated in the centre of a little low plain, surrounded by mountains, owes probably to this locality the excessive heat of its summer and the moderate cold of its winter. Elphinstone reckons, by memory, the *maximum* heat of the summer of 1809, which was considered as temperate, at $+49^{\circ}$. Frequently the thermometer indicated $+45^{\circ}$, under a tent that was kept artificially cool. During winter, frost is frequent in the night and morning; the *minimum* is $-3^{\circ} 88'$:

during the daytime the atmosphere becomes warmer, and the air is very mild. Few localities are so favourable to the combination of the vegetables both of warm and temperate climates. The atmosphere, which is generally mild when it is not very hot, and the soil, that is constantly watered by numerous rivers, keep up a vigorous and varied vegetation. Thick grass, whose verdure, during most of the year, rivals that of the meadows of the north, covers the uncultivated spots. The banks of the rivers are fringed with Willows and Tamarisks, thirty or forty feet high. The villages can scarcely be discerned through the fruit-trees which environ them. The Pomegranate, the Mulberry, the Banyan, the Date, the Orange, and some other Indian trees, which retain their foliage at Peshawer all the winter, mingle with all the species that our orchards afford. The avenues to the town are bordered with Cypress and Planes.

3986. *At Cabul*, where the summers are not so hot, and the winters, without being severe, are colder, and accompanied with frequent falls of snow, the fruit-trees of Hindostan are not seen, while those of Europe abound. The emperor Baber caused the Sugar-cane to be planted, but it is not probable that it would succeed.

3987. *We must not omit the central part of the empire*. It is raised, so to speak, by several chains of mountains, which, like the rays of a circle, springing from different points, meet at a common centre. The farther these chains advance into the country, the higher do the valleys become, and the more, consequently, does the temperature decline. Between the parallels of 32° and 34° , there are summers hardly warmer than those of England; and winters

which, if not so severe as those of Norway, are equally subject to frost. The snow lies for three or four months; all the rivers are frozen, so that men on horseback, and camels loaded with baggage, can cross upon the ice. It is said that the plain of Ghazna (lat. $33^{\circ} 30'$), which is a part of the central table-land, is the coldest spot in the kingdom.

3988. Few Indian plants inhabit Cabulistan, while those of Europe are in great abundance there. The Vine, the Peach (fig. 590.) and Apricot (fig. 591.), &c. grow wild, and seem as

PEACH.

APRICOT.

indigenous as in Asia Minor. The prevailing trees on the mountains are various species of *Pinus*, one of which bears cones as large as artichokes, and seeds as big as pistachio nuts. It is probably the Stone Pine (*Pinus Pinea*). There are likewise Cedars, a Cypress of prodigious height, and several kinds of Oak. The Walnut, Pistachio, and Terebinth also inhabit the mountains. Elphinstone thinks, too, that he remembers having seen the Holly, the Birch, and the Nut (*Corylus Avellana*). On the uncultivated plains, the commonest trees are the Mulberry, the Tamarind, the Plane, the Poplar, and several sorts of Willow. The culture of Sugar-canes, Cotton, Indigo, Melons; of *Sorghum spicatum* and *S. vulgare*; of Sesame (*Sesamum orientale*), and of Rice, is not unusual in the warmer districts. That of Wheat, Barley, Maize, Beet, Carrot, and many other kitchen vegetables, is prevalent, wherever there is little industry, combined with a productive soil.

3989. These vague and incomplete accounts rather awaken than satisfy our curiosity. Indeed, the Flora of the empire of Cabul is even less known to us than that of China.

3990. Before passing into Persia, we must say a few words on the countries which extend to the west and north-west, from the Paropamisian mountains to lat. 41° , and which comprehend the districts of Balkh, Mauer el Nahr, Bokhara, and Khorassan, &c. Already the climate is too cold for the growth of the Olive; but a great number of the woody vegetables which are found along with it in the Transition Zone may be seen, either wild or cultivated, according to the localities. These districts present a curious assemblage of plains and mountains; of steppes which are grassy or arid, sandy, sterile, or frequently saline; of bad soil, and of remarkably fertile land. In the cold season, the water is all frozen, and caravans cross the rivers on the ice. In the winter of 1820-1, the Baron Meyendorff, who was sent from the court of Russia to Bokhara, saw the thermometer fall there to twelve or thirteen degrees below zero, though the season was in general very mild. The heats of summer compensate the cold of winter; the former is so intense and prolonged, that it dries up almost all the watercourses.

3991. The provinces of Herat, Dheï, Molla, Khiva, Bokhara, and Samarcand, &c., environed by deserts, resemble the lovely oases of Egypt. Nowhere is the population more numerous, the cultivation more careful, and vegetation more productive. The gardens and orchards, which are very frequent, contain a great quantity of fruit-trees, among which the Pomegranate, the Pistachio, and the Fig afford most delicious fruits. There are large plantations of the White Mulberry (*Morus alba*) (fig. 592.), and the Tartarian Mulberry (*M. Tatarica*). Cotton, Indigo, Sesame, *Sorghum saccharatum*, Rice, and all the European grains and vegetables, are cultivated.

WHITE MULBERRY.

3992. According to Falk, the common trees and shrubs of Bokhara are the Terebinth tree (*Pistachia terebinthus*), *Eleagnus angustifolius*, *Ulmus campestris* and *effusa*, the Whitethorn (*Cratægus Oxyacantha*), *Pyrus Aria* and *Aucuparia*, *Mespilus Cotoneaster*, *Spiræa crenata*, *Rosa pimpinellifolia*, the Caperbush (*Capparis spinosa*),

Clematis orientalis, the Birch (*Betula alba*), the Poplar (*Populus alba*), &c.

3993. The steppes produce in abundance the Tamarix, the Almond (*Amygdalus nana*), the *Calligonum polygonoides*, and a tree of low growth which has caducous leaves, like those of the Larch, and which Falk supposes to be the *Abies orientalis*, and Pallas the *Juniperus lycia*, or the Savin (*Juniperus Sabina*).

3994. *In the southern parts of Bokhara, the Oriental Plane (*Platanus orientalis*) becomes a tree of colossal growth.*

SECT. III. *Historical Geography.*

3995. *This region was very little known or regarded by the ancients. Under the names of Arachosia, Paropamisus, Drangiana, and Gedrosia, it was regarded as a rude, barbarous, and impracticable tract. The route to India and the East was through Aria (the bordering part of Khorassan) and Bactria on the south of Hindoo Koosh. It was chiefly known by the expedition of Alexander, who, in entering India from the side of Bactria, was obliged to penetrate through the defiles of Cabul, and who, in returning by the southern deserts of Gedrosia, encountered obstacles of the most formidable character. In modern times, Independent Persia has acted a prominent part in the revolutions of Asia. In the eleventh century, Mahmood of Ghizni made that city the capital of an empire which extended to the extremities of Persia and India. His dynasty was crushed before the victorious invasions of Zingis and Timur; and Cabul was comprehended with Hindostan under the Mogul empire. The city of that name became a Mogul capital, and was the favourite residence of Baber, one of the greatest monarchs of that race. When the empire fell to pieces, the hardy population of Cabul was not slow in re-asserting its independence; and towards the commencement of the last century they became the conquerors and the desolators of Persia. Nadir, however, a Persian adventurer, drove out the Afghans, subdued them in their turn, and carried his arms into Hindostan. On Nadir's death, his kingdom fell to pieces; and Ahmed Shah, a brave Afghan chief, seized the opportunity to render his country independent, and himself its king. He also invaded India, and in the battle of Panniput broke the power of the Mahrattas, who were about to seize the fallen sceptre of the Mogul. His successes enabled him to appropriate the finest provinces of Western India, Lahore, Moul-tan, and Cashmere, to which he added Balkh. The kingdom of Cabul became one of the most powerful in Asia; but since the death of Ahmed Shah, it has been broken up by the dissensions among his family and the power of Runjeet Sing, who has occupied several of its finest provinces. Its limits do not now extend beyond Afghanistan Proper.*

SECT. IV. *Political Geography.*

3996. *The political constitution of Cabul exhibits peculiarities which distinguish it from that of almost every other Asiatic monarchy. Instead of the power being monopolised by the sovereign, or at least by the khans, with no check but the influence of rival chiefs, it admits a large infusion of popular elements. In every oolooss, or tribe, there is a jeerga, or representative assembly, without whose consent the khan can undertake nothing, and who also administer justice, though in some subserviency to the rooted principle of private vengeance. Among the people, much more attachment is felt to the jeerga than to the khan. These tribes may be said to form independent states, and they even carry on war with each other. Their only vassalage to the king consists in a tribute, and a contingent of troops in war; both which, especially the former, are with difficulty exacted. In the large cities and their vicinity the authority of the sovereign is much more extensive; but the rude and desert tracts to the south are abandoned to independent chiefs or lawless banditti.*

3997. *Among the Afghan tribes great reverence is paid to birth, and particularly to antiquity of descent. The khan must be taken out of the oldest family in the tribe; but the king either appoints him, or at least has great influence in procuring his appointment. The two leading tribes are the Ghiljies and the Dooraunees: of whom the former are the rudest, the fiercest, and the most warlike; the latter are more orderly and peaceable, and in all respects of a superior character. The Ghiljies were the conquerors of Persia; but Ahmed Shah belonged to the Dooraunee tribe, which became, therefore, the ruling one. At this ascendancy the Ghiljies cherished mortal resentment; and, indeed, the antipathy between the two tribes is such, that it is with difficulty restrained from breaking into open war.*

3998. *The revenues of the kingdom of Cabul arise from the land-tax, the tributes paid by vassal chiefs, the royal demesnes, and some minor sources. A considerable proportion, however, must often be remitted to the tributary princes, who, if they did not receive this remission as a grant, would be in danger of rebelling against the power which should persist in exacting the full amount.*

3999. *The military force, or at least the most regular and efficient part of it, consists of Gholaums, a body formed partly of military adventurers, partly of persons holding lands or grants on a military tenure in and around the great cities. They form a well-disciplined and disposable army, about 13,000 strong. The Dooraunees are easily mustered, to the amount of 12,000 brave highland militia, each fighting under the banner of his own chieftain. The contingents of the other tribes amount collectively to a much greater number; but they are drawn out with great difficulty, unless for local purposes, or with a peculiar hope of plunder. The entire force commanded by Ahmed Shah, in the battle of Panniput,*

was estimated at 40,000 men, which, perhaps, may be nearly as large an army as can be levied from the country for a foreign expedition.

SECT. V. *Productive Industry.*

4000. *A very great portion* of this vast region is doomed to complete and irremediable barrenness, produced by the opposite extremes of lofty and snow-covered mountains, and of sandy plains. Other portions, however, of considerable extent, bear quite an opposite character. The lower declivities of the mountains, and the high plains interspersed between them, though they do not offer the profuse products that cover the plains of Delhi and Ispahan, are often equal to the finest parts of Europe. Nor are these natural advantages neglected by a rough but active and laborious people. Irrigation, as in all tropical countries, forms the most important and arduous part of husbandry. It is attended here with peculiar difficulties; the water from the heights being apt to run over its slopes in destructive torrents rather than in fertilising rills. To remedy this evil, it is not only necessary by canals to lead the water through the fields, but by levelling and embankment to retain it. A remarkable process is employed, by which the water of a number of wells is collected together, and distributed over a field. Extensive operations of this kind are the more difficult, from the small portions into which the occupancy of land is here divided. They are sometimes performed by an association among the little proprietors; sometimes by a rich man employing his capital on this object. Wheat and barley, instead of rice, are the principal species of grain; the first for the food of man, the latter for that of horses. Fruits and vegetables are produced in such abundance, that their cheapness is almost unequalled.

4001. The people have not extended their industry to *manufactures*, except those of coarse fabric for internal consumption. The kingdom of Cabul, by its situation, is excluded from maritime commerce; and the coast of Mekran is too poor to make much use of its natural advantages in this respect. The country, however, carries on a considerable inland trade within its own provinces, with the neighbouring countries, and also as a thoroughfare between Persia and India. This traffic is conducted by caravans, which employ camels where the route is practicable for them, but in the rough mountain roads of Afghanistan horses and ponies are substituted. These caravans journey under continual dread of the predatory tribes, which infest almost every part of this country. Above all, in passing through the territories occupied by them, the strictest precautions become necessary. The best parts of Eastern Persia produce rather the simple necessities of life, than those superfluities which can become the objects of exchange. Fruits, assafœtida, madder, and a few furs, form the principal articles. In return, they receive the manufactures of Persia and India, and even those of Europe, by way of Orenburg and Bokhara.

SECT. VI. *Civil and Social State.*

4002. Mr. Elphinstone gives the following conjectural estimate of *the population* of the kingdom of Cabul:—

Afghans	-	-	-	-	-	4,300,000
Belooches	-	-	-	-	-	1,000,000
Tartars	-	-	-	-	-	1,200,000
Persians	-	-	-	-	-	1,500,000
						8,000,000

4003. *This estimate*, besides the main body of the kingdom, includes, we presume, Balkh and the subject part of Khorassan, but not the Indian provinces of Cashmere and the Punjab, to which are assigned a population of about 6,000,000.

4004. *The Afghans* (*fig. 593.*), who form the main body of the population, present, in their aspect and character, a very striking contrast to the Hindoos, on whom they immediately border. Their high and even harsh features, their sunburnt countenances, their long beards, loose garments, and shaggy mantles of skins, give the idea of a much ruder and more unpolished people. The arts of life are less advanced, and many of the luxuries of Hindostan unknown: there is nothing like the same organised police and regular course of justice. Under this rough exterior, however, are soon disclosed estimable qualities, which advantageously contrast with the timid servility produced by long subjection in the Indian. Their martial and lofty spirit, their bold and simple manners, their sobriety and contempt of pleasure, their unbounded hospitality, and the general energy and independence of their character, render them on the whole a superior race. In India, every movement originates with the government or its agents, and the people are accounted as nothing; while here,

men put themselves little under control, and follow undisturbed their own inclinations. Although Asiatic dissimulation prevails, especially at court, yet their intercourse is by no means marked by that profound and systematic deceit which characterises the subjects of the great empires. They show also an active curiosity with regard to the products of European art and skill, with an eager disposition to enquire into the processes employed; while in India all these things are regarded with a mere polite indifference. Although polygamy and the obtaining of wives by purchase are equally established, yet the former is not carried to the same extent, nor attended with the same strict seclusion; and hence the degradation of the female sex, which is the necessary consequence of such arrangements, does not take place in a degree so remarkable. Matrimonial contracts are not, as usual in Mahometan countries, negotiated entirely by the friends of the parties; but, in the country districts especially, the parties themselves have often the opportunity of meeting and forming attachments. These cannot be fulfilled, indeed, until the youth has earned the purchase-money of his mistress; but though this be in itself far from a romantic feature, it gives rise to delays and difficulties, which often impart a character of interest and adventure to the connection. It has thus become the subject of love-tales somewhat similar to those which are popular in Europe. This pecuniary value of the female sex, and difficulty of purchase, has led to a very odd species of penal infliction. The offender, on being convicted, is sentenced to pay to the injured person or his friends, a number of young women, proportioned to the enormity of the offence. Twelve ladies form the fine for murder; in minor offences the amount is of course diminished.

4005. *The established religion, in Afghanistan, is strictly Mahometan, though toleration prevails more than even in the Persian empire, where it has been observed to be greater than usual in Mussulman countries. As in other Mahometan states, no established provision is made for the priesthood. The mollahs, or religious doctors, are solely supported by individual donation, whether in the shape of permanent foundation, regular salary, or occasional gift. They form, however, a species of corporate body, called the ulema, who admit new members, after a due course of study and a strict examination. They are numerous, and often assert their rights in that turbulent manner which characterises the nation. They take arms, and in the neighbourhood of the great cities muster sometimes hosts of 2000 or 3000, who, though they cannot match the prowess of the Afghan warriors, are so aided by the superstitious awe of the multitude, as generally to carry their point. In the rural districts their character is more respectable; and by promoting peace and inculcating the moral duties, they render themselves really useful to this rude people.*

4006. *A taste for knowledge is general among the Afghans, though they have not produced any writers who can rival in fame those of Persia and India. Few of the works in the language, indeed, are above two centuries old, and they are evidently imitations of the Persian. The late sovereigns of Cabul have sought to promote learning, and even cultivated the muses, though not with any brilliant success. Unfortunately, the Afghans, considering the Persians as heretics, guard against resorting to their colleges. Peshawer enjoys the highest reputation in the country, and a considerable number resort to Bokhara. There are, besides, schools in every little town and even village, so that the first elements of knowledge are very widely diffused. The higher branches are logic, law, and theology, to which are added the Persian and Arabic languages and literature. Study, in the Mahometan countries, proceeds in a fixed and invariable course; so that, when you know the last book a man has read, or the last subject he has studied, you know all that has gone before it, and all that is still wanting. The taste for poetry is very general, and a considerable number of people in the towns even make the public reading of it a distinct employment. The poets by profession are not to be compared with those of Persia; but a considerable display of genius often appears in the rude verses of the chiefs and warriors, who celebrate their own feelings and adventures. Those of Kooshkaul, a khan who defended his native country against the power of Aurungzebe, display a peculiar degree of poetic fire.*

4007. *Afghanistan has a language peculiar to itself, called Pushtoo. About half the terms, including all those of an abstract import, were traced by Mr. Elphinstone to foreign sources, chiefly the Persian. The rest appear to belong to an unknown root, though it is admitted that of these a careful examination by a profound Oriental scholar might diminish the number.*

4008. *The inhabitants of Afghanistan are formed into two great divisions, — of dwellers in tents, and dwellers in houses. The former, in the western part of the kingdom, are supposed to constitute one half of the population; in the eastern they are fewer, but still very numerous. The Afghans have generally a strong attachment to the pastoral life, and are with difficulty induced to quit it. Contrary to the ideas which prevail in Europe, they hold in disdain a residence in towns, together with the occupations there carried on, and leave them to inferior and foreign races. The most numerous of these are the Tadjiks, who have been supposed to amount to 1,500,000, and to be the original people subdued by the Afghans, who regard them with contempt. They inhabit the towns and their vicinity, and carry on those trades which are disdained by the ruling people. The fixed habitations of the lower orders are rudely constructed of unburnt brick, with wooden roofs. The palaces of*

the great are on the Persian model, though in an inferior style of magnificence; their chief ornaments are Persian pictures and carpets.

4009. *The Afghans are fond of all sorts of boisterous amusements*, particularly those which involve great display of bodily activity. Hunting is as it were the rage over all Afghanistan, and the people pursue it not only in all the known and usual modes, but in others peculiar to the country itself. Sometimes a whole neighbourhood assembled forms a circle, and sweeps together within it all the game belonging to a certain district. In the villages much delight is taken in the *attum*, a hearty and noisy dance, consisting in violent movements, in which both sexes join. They delight in the fighting of quails, cocks, and other animals; and they amuse themselves at marbles, hopping on one foot, and other games considered in Europe as suited only to children.

4010. *The Afghan dress* presents a striking contrast with the Indian attire of light, loose, flying robes, leaving a great part of the body naked. It consists of close tunics and wide mantles, composed, among the lower ranks, of sheepskin or coarse woollen cloth; among the higher, of velvet, fine shawl-cloth, or silk. Boots are almost universally worn, and no one is allowed to appear at court without them. Jewels are chiefly employed to decorate their armour. The favourite dress of the ladies consists of jackets, somewhat similar to those of dragoons, and pantaloons, both composed of velvet, shawl-cloth, or silk. Strings of Venetian sequins, chains of gold and silver, and ear-rings, are the most valued ornaments.

4011. *Although the Afghans are a sober and temperate people*, they are enabled to live well, by the extreme cheapness of all provisions, particularly fruit and vegetables. They are also social and hospitable; and even the poorer classes, when they can afford to kill a sheep, invite some neighbours to partake. The dishes are merely the mutton with the broth in which it has been boiled; the drink is butter-milk, or sherbet; and conviviality is chiefly promoted by the use of tobacco. At the tables of the great, rich pilaus, and dishes variously dressed, are presented on trays, after the Persian manner, and ornamented with gold and silver leaf. The Afghans talk a good deal at table, usually in a somewhat grave style, though not without occasional sallies of mirth. One of their favourite amusements consists in walks and collations in the numerous gardens which surround their cities, particularly Cabul, and the views from which are indeed of a peculiarly enchanting description.

SECT. VII. *Local Geography.*

4012. *Afghanistan is divided*, like the ancient kingdom of Israel, almost solely according to the tribes who inhabit it. The Berdooraunees are the principal tribe of the eastern Afghanistan; and though they are much inferior to the Ghiljies and Dooraunees, their country derives some importance from its capital, Peshawer, the recent seat of government. Enclosed between the highest ranges of Hindoo Coosh, the Indus, and Solimaun, their whole territory is peculiarly rugged; yet, as it contains many fertile valleys, and is carefully watered and cultivated, it maintains a great population. The Eusofzies, who occupy the north-east corner of this region, present the most complete specimen of the original Afghaun rudeness. They hold their present lands by conquest, and distribute them in a very singular manner. As each tribe is split into two independent parts, these have portions assigned to them equal in quantity, but often differing in fertility. To atone for this disparity, they cast lots for their share every ten years, and, in case of obtaining a different one from that actually possessed, an immediate exchange takes place. It is said to be effected with much less of disorder and disadvantage to cultivation than could be expected. The Eusofzies are the most independent of the Afghans, and scarcely own any subordination whatever. The mountaineers, in particular, are excessively rude and ignorant: an instance is given of one of them who, seeing a mollah copying the Koran, struck off his head, saying, "You tell us this is the book of God, and yet you make it yourself." The inhabitants of the plains, on the contrary, are debauched and superstitious.

4013. *We shall not dwell on the Turcolaunees, Otmaunkhail, Upper and Lower Momunds*, small tribes, though each presents some few peculiarities. From the high peak of Suffaid Koh to the Indus extends a range of rugged mountains with narrow valleys, which, being crossed by the great road from Cabul to Peshawer, affords to the *Khybercees*, its rude inhabitants, peculiar opportunities for exercising the predatory habits peculiar to this nation. They employ the most vigilant precautions to prevent a single traveller from escaping. Sentries are stationed at all the leading points; and the very sound of the horses' hoofs echoing along the narrow valleys summons them to their prey.

4014. *The country extending southward* between the range of Solimaun and the Indus is called *Damaun*. The dress here assimilates more closely to that of Hindostan, being composed of white cotton robes, with wide turbans. The people are more simple and less turbulent than the northern tribes; and though robbers, like the rest, are celebrated for their honesty. The Sheraunees are a numerous tribe. They are peculiarly distinguished by having a *Necka*, or magistrate, whom they believe to be in direct communication with the Deity; wherefore they apprehend that disobedience to his will must be attended with awful and immediate calamities. Though indiscriminate plunderers, they are very faithful to those who purchase an escort. The Vizerees inhabit the immediate ridge of Solimaun; an awful region of rocks, torrents, and pine forests. They have the high features peculiar to mountaineers, are simple in their manners, and are scarcely ever seen out of their own country. Though they make a rule of plundering all who enter it, they allow an easy composition, and faithfully adhere to it; but the tribes whose wanderings alone carry them through this region, being rough and poor like themselves, usually prefer fighting it out.

4015. *Peshawer*, the only large city in this region, was the capital of the kingdom of Cabul, previous to its late dismemberment. It is situated in a very fertile plain, about thirty-five miles broad, bounded by the loftiest ranges of Hindoo Coosh and Solimaun. This city was occupied by Runjeet Sing, ruler of the Seiks, who, however, did not attempt to retain it, but allows it, with the surrounding district, to be held on payment of a tribute by a chief named Mahommed Khan. This prince has an army of only 3000 horse and 2000 foot, but he can rally under his standard a number of the mountaineer tribes. Peshawer, in consequence of this change, has much declined; and, instead of 100,000 inhabitants, contains scarcely 50,000. The city is rudely built, and its few good public edifices are much decayed; but it presents a picturesque aspect from the varied appearance and costume of the inhabitants of the surrounding mountains, mingled with the natives of India, Persia, and Tartary.

4016. *The country of the Ghiljies* occupies the central part of the kingdom of Cabul, and forms an irregular parallelogram of about 180 miles by 85. The whole region is elevated and cold, and in its northern parts is overlooked by those lofty peaks which tower above the plain of Peshawer. Its valleys, however, particularly that of Peshawer, are extremely fertile and beautiful. This proud race, who, during successive ages held sway over Asia, now indignantly endure the supremacy of the Dooraunees, and have even endeavoured to shake it off by recent insurrection. In compensation, however, for the loss of that dominion which they possessed during the early part of the century, they have attained a greater share of domestic independence than they before enjoyed. Their chiefs, being no longer supported by royal influence, are scarcely regarded

with any degree of deference, and an almost pure democracy prevails. The military governors, indeed, appointed by the king, successfully exert themselves to collect the revenue, levy the contingents of troops, and, in the immediate neighbourhood of the great cities, maintain a tolerable police; but their power elsewhere does not extend to the prevention of individual feuds, or even warfare between tribes in the remote districts.

4017. *In this territory* is situated Cabul, now the principal city of Afghanistan, and one of the most delightful in the world. Being situated about 6000 feet above the level of the sea, it enjoys a temperate climate, and is surrounded by an extensive plain finely watered by three rivulets. The soil is rather deficient in grain, but produces abundance of forage and a profusion of the most delicious fruits, which are exported to India and other countries. Cabul is a busy bustling city, and its bazaar of 2000 shops is considered almost without a rival in the East. The population is estimated by Mr. Burnes at 60,000. It is governed by Dost Mahommed, brother to the chief of Peshawer, an able and popular prince, and now the most powerful in Afghanistan. He has an army of 9000 well-armed horse, and 2000 infantry.

4018. *In this country is situated Ghizni*, or Ghuznee, the most celebrated of the cities of Cabul; once the proud capital of the East, where Mahmood reigned and Ferdusi sang, but now comprehended within very narrow limits. It does not contain above 1500 houses; its streets are dark and narrow, and its bazaars by no means spacious. Remains, however, though not quite equal to its fame, attest its former grandeur. The most remarkable are two lofty minarets without the present walls, and the tomb of Mahmood, a spacious but not magnificent building, over which mollahs are perpetually employed in reciting the Koran. Bameean, on the northern slope of the mountains, and bordering on Tartary, is a city cut out of the rock, whose cavern abodes are scattered over a surface of eight miles; and it contains some remarkable temples, with colossal idols.

4019. *The western and most extensive portion of the kingdom of Cabul* is that occupied by the Dooranees. Their territory reaches more than half the length of the kingdom. Being bounded, however, on the north by the mountainous tracts of Paropamisus, occupied by the Eimauchs and Hazaurehs, and on the south

DOORANEE CHIEF.

by the sandy plains of Seistan, the region is narrow, seldom equaling, and never exceeding, 140 miles. Although their political constitution generally resembles that of the other tribes, the Dooranees are under much greater subordination to the king. He even appoints their *sirdars*, or chiefs, though he is obliged to consider somewhat their inclination, and the candidate's place in his tribe. This appointment, and the offices at court, which are bestowed almost exclusively upon the Dooranee chiefs (*fig. 594.*), enable them to maintain a very considerable power; though, as their importance with the king depends much on the attachment of their adherents, their sway must be mild and conciliatory. It is sufficient, however, to prevent private war; and the valour of the Dooranees is displayed chiefly in defence of the monarchy, of which they form the main bulwark. Their population is supposed to be from 800,000 to 1,000,000; the great proportion of whom are shepherds, living under tents, and leading a gay, innocent, pastoral life, with frequent festivals, in which preparations of milk and sherbet form the only regale. The agricultural part of the tribe live in small villages, to each of which is attached the castle of a khan, who seems to hold a rank in society somewhat similar to that of the Scottish laird. At one of the gates is always a building set apart for the reception of strangers.

4020. *Candahar*, the only place of consequence in the Dooranee territory, is a very ancient city, the foundation of which is ascribed to Alexander the Great. The antiquity, however, belongs chiefly to the site, upon which new towns have been successively erected by different conquerors and potentates. The present was built, about half a century ago, by Ahmed Shah; who even attempted, but with little success, to give it his own name. It is regular and well built, with four long and broad bazaars; but, like other cities, it is not adorned with those magnificent monuments of architecture which mark the capitals of the great empires. One of the mosques, and the tomb of Ahmed Shah, small but elegant, are its only ornaments. This city, with the surrounding country, is now possessed by Cohun Dil Khan, brother to the chiefs of Cabul and Peshawer, who has an army of 9000 horse; but his government is not popular. Kumran, the only representative of the fallen dynasty of Cabul, has now only a precarious hold of Herat and its territory. Ferra, the ancient Parra, is a large walled town, about midway between Candahar and Herat.

4021. *The mountainous districts* of Paropamisus are inhabited by the Eimauchs and Hazaurehs, belonging, perhaps, more properly to Khorassan, or rather to Independent Tartary. The latter, in respect to their general appearance at Peshawer, are described by Mr. Elphinstone as "not more remarkable for their conical caps of skin, with the wool appearing like a fringe round the edge, and for their broad faces and little eyes, than for their want of beard." These features mark them as descended from the Mongols, though it is not very well known how such a race came where they now are. Though subject to the Cabul government, they are in a constant state of petty warfare; each village has a watch-tower to sound the alarm. They are merry, good-humoured, friendly; but irritable and capricious. They scarcely differ from the Eimauchs, except that the two tribes have adopted with equal zeal the opposite Mahometan creeds.

4022. *The south-east corner of the kingdom* is occupied by a race called the Caukers, who seem to have few peculiarities. They are rude, but peaceable, and less infected than their neighbours with the predatory spirit. We may conclude our account of the Afghans with noticing the Naussers, a tribe of about 10,000 families, who have no fixed territory or abode whatever. In summer they scatter themselves, and find pasturage in all the high unoccupied tracts throughout the centre of the kingdom. In winter they emigrate to the warm plains of Damaun. To reach these they must cross the ridge of Solimaun, and fight their way through the Vizerees, who have their scouts all on the watch when the period of this grand passage approaches. The Naussers, on their part, appoint an autumn rendezvous on the western side of the Solimaun, all the roads to which are at that season literally choked with the crowds of men, camels, and cattle, hastening to the spot. Having assembled, they set forth, in a close body, with scouts to explore the path, and armed detachments on every side to repel assault. The Vizerees do not attempt any general onset, but merely seize every opportunity of harassing the rear, and cutting off stragglers. The Naussers, though of rude manners, are an honest and peaceable race.

4023. *South of the Dooranee highlands* lies the province of Seistan, or Seestaun, traversed by the river Helmund, which, at its western extremity, forms the great lake of Zerrah, or Durrah, into which flows also the smaller stream of the Furrah. This country, celebrated in Persian story and song as one of the finest regions of the East, exhibits at present a dismal reverse. With the exception of a narrow belt along the banks

of the rivers, it consists entirely of sandy and barren plains, over which a few Afghan and Belooch shepherds are seen driving their flocks. Yet the remains of extensive cities, with superb palaces, which the traveller finds at short distances as he journeys along the Helmund, fully exempt the Persian representations concerning this region from the charge of fable. The cause of its decline is obvious, and, perhaps, beyond human power to remedy. This province is encircled on every side by those immense deserts which stretch from the eastern frontier of Persia. The wind, which blows thence for a great part of the year, brings with it clouds of light and shifting sand, which converts the fields into an arid waste, and gradually buries beneath it gardens, houses, and even villages.

4024. *The original inhabitants of Seistan* are the race already mentioned under the appellation of Tanjiks, mixed in the east with a pretty large colony from Beloochistan, and with some other tribes. They are ruled by a number of petty chiefs, who acknowledge a sort of nominal supremacy in one who resides at the capital, called by Elphinstone Jellalabad, and by Kinneir Dooshak. It is a neat city, small but well peopled; and the inhabitants are more polished than those wandering tribes who elsewhere pitch their tents amid the ruins of ancient palaces. The chief claims, truly or falsely, the most august descent in Asia, that from Cyrus; and in the course of the last century his ancestor made an attempt to restore the ancient greatness of his house, and actually conquered a great part of Khorassan. He yielded, however, to the sword of Nadir Shah, and his successor can now with difficulty raise three thousand men. He is subject, moreover, to the king of Cabul, to the extent, at least, of furnishing a tribute and a contingent of troops.

4025. *The lake of Zerrah, or Durrah*, has been much famed, and is the only considerable expanse of water in these countries. It is about ninety miles in length and twenty in breadth; but in the dry season it is shallow, and overgrown with reeds, so as to resemble rather a marsh than a lake. The water is brackish, but it abounds with fish and wildfowl. In the centre is a fortified island, where the nobles of Seistan were wont to seek refuge while their country was invaded. About 100 miles to the west, near the frontier, lies Kubbees, a small city, situated in the midst of a vast desert.

4026. *The southern part of Independent Persia* is generally represented by geographers as forming the Persian province of Mekran, and is equal in extent to the whole of what has now been described. Its districts, however, have no connection with Persia, and very little with each other. The whole is either abandoned to desolation, or divided among a number of small, fierce, independent, predatory tribes. The northern and inland division, separated from the southern and maritime districts by a high range of mountains, is known by the name of Beloochistan. The whole of its western part is composed of a desert of red moving sand, so light and minute as to be almost impalpable, but which is formed, by the action of the wind, into wavelike ridges of a peculiar structure. One side slopes gradually away, but the other rises perpendicularly, like a brick wall, to a considerable height; and this side the traveller, in order to prosecute his route, must often scale with immense labour. The light sand, filling the eyes, nostrils, and mouth, heightens thirst and irritation; while the phenomenon of mirage causing the appearance of a still lake that is perpetually receding, tantalises him with the always disappointed hope of arriving at water. Mr. Kinneir calculates this desert at 400 miles from south to north, and 200 from east to west; but this last dimension must be doubtful, and seems under-rated.

4027. *Eastern Beloochistan* is of a very different character. It consists of a huge mass of rugged and rocky mountains, with intervening valleys, which, however, seldom display that fertile and smiling aspect usual in countries under the tropic, but are in general arid and stony. The streams, when swelled by rain, roll through their beds with such headlong rapidity as quickly to leave them dry, serving as roads or nightly resting-places to the traveller: but the water sometimes rushes down so suddenly as to overwhelm those who have sought this shelter; an accident under which Arrian reports the army of Alexander to have severely suffered. There are patches of good verdure, even capable of cultivation. The best district is the north-eastern land of Caht Gundawe, which affords even a surplus of grain for export. The capital is Kelat, a town of about 4000 houses, supposed to stand on ground 8000 feet above the level of the sea, and, therefore, subject in winter to such intense cold, that the khan and principal chiefs then descend to a lower region. It enjoys, however, a considerable inland trade. It is the residence of a chief, who claims the sovereignty over all Beloochistan, though his real power is nearly confined to the district immediately adjoining. Nooshky, Sarawan, Thalawan, Kharan, are little mud towns, capitals of districts bordering on the desert; but Punjgoor is surrounded by a fertile territory watered by the Baldoo, which, after a considerable course, reaches the Indian Ocean. The Belooche is a brave, hospitable, honourable robber, making *chepaos* or raids of eighty or ninety miles, to burn a village and carry off the inhabitants as slaves, but treating kindly and securing from all harm the stranger who has, or purchases a claim to, his protection. Conjoined with him is the Brahooe, who seems to have been the original possessor, and who, mild, innocent, and pastoral, occupies little villages situated in the bosom of these stupendous mountains.

4028. *At the south-eastern corner of Beloochistan* is the province of Leia, the seat of the ancient Oritæ, watered by the Pooralee, a flat and fertile region, containing Bayla, a town of 2000 houses, and Somneany, an inconsiderable fishing-town. The upper tracts of this province, however, are inhabited by the Bezunjas, pre-eminent in their rapacious habits, even above the other Belooches, "who care not for king, khan, God, or the prophet; but murder or plunder every person or thing they can lay their hands on." Buhmict Khan, the chief of Bayla, however, having pledged his faith to Mr. Pottinger, assured him that "he need not now fear any thing mortal."

4029. *The territory between the ocean and the chain of mountains bounding Beloochistan* is Mekran Proper, and is very similar to that already described. The mountains, though on a smaller scale, are equally rude and rocky, with arid valleys intervening, traversed by numerous beds of mountain torrents, but occasionally presenting verdant and cultivated spots. Gwutter, Choubar, and Jask are small sea-ports, with some trade, subject or tributary to the Iman of Muscat. Kej, reckoned the capital of Mekran Proper, is a considerable town in a very strong situation, the chief medium between the sea-coast and the interior countries. It is still held by the khan of Kelat, who has scarcely any other hold upon this country. Bupore is a small fortified town near the frontier of Kerman. This western tract of Mekran is infested by banditti called Loories, of a much baser and more brutal character than the usual predatory hordes of Asia. Unlike them, they have renounced every religious belief, and conceiving that men were born to die, to rot, and be forgotten, not only plunder and murder without scruple, but abandon themselves to every species of depravity. In consequence of this profligacy, scarcely any children are born in the community, and its numbers are recruited almost solely by captives violently carried off from the neighbouring tribes.

CHAP. V.

HINDOSTAN.

4030. *The region known to the ancients by the name of India*, to the Arabs by that of Al Hind, and now most commonly by the Persian appellation of Hindostan, has always been the most celebrated country of the East. In every age it has been the peculiar seat of

Oriental pomp, of an early and peculiar civilisation, and of a commerce supported by richer products than that of any other country, ancient or modern.

SECT. I. General Outline and Aspect.

4031. *The nominal limits of Hindostan* have varied at different times. In the west, especially, it has sometimes been extended over a great part of Afghanistan, which was often the seat of its ruling potentates. The real Hindostan, however, seems clearly marked both by precise natural boundaries, and by the fixed and deep-seated character of its native population. The boundary on the north, but running in a direction between north-east and south-west, consists of that unbroken and amazing range of mountains, which receives in India the name of Himmaleh or Himalayah, and separates its fine plains from the bleak table-land of Thibet. On the west, it is the Indus, from the point where it bursts through the northern mountains, to that in which it joins the Indian Ocean. Into that ocean, southern Hindostan projects, in the form of a vast triangular peninsula, which presents two opposite coasts, Malabar to the south-west, and Coromandel to the south-east, both terminating in the southern extremity of Cape Comorin. Thence India is prolonged by the large contiguous island of Ceylon. The coast of Coromandel, with the opposite shores of Arracan and Malacca, enclose a large sea, called the Bay of Bengal. Between this bay and the termination of the Himalayah occurs a short interval, forming the most eastern and the least accurately defined boundary of Hindostan. The natural limit here seems to be the channel of the lower Brahmapoutra, though Bengal claims a certain extent of hill and jungle on the other side.

4032. Amid the grand features of nature in this region, the extended mountain range of *Himalayah*, which forms its northern boundary, is pre-eminent. After crossing the Indus, and enclosing the beautiful valley of Cashmere, this range, which, in bounding Afghanistan, under the name of Hindoo Koh, had an almost due easterly course, takes a south-east line,

which it nearly follows till it passes the frontier of Hindostan. The name, which is derived from the Sanscrit term *Hem*, snow, is evidently suggested by that long range of pinnacles, white with eternal snow, that is seen far along the wide plain of central India, which luxuriates in the perpetual summer of the tropics. Although the wonderful distance from which these peaks are descried could not but indicate them to be exceedingly lofty, yet the difficulty of reaching them across a hostile country long prevented any accurate observation. Thirty years ago, their summits were not supposed to rival those of the Cordillera, believed then the most elevated on the globe. It was in 1802 that Colonel Crawford, after a residence in Nepal, communicated observations, according to which Chimborazo must yield the palm to Dwalagiri and Chandradabani. Intense curiosity was thus excited, and a series of investigations followed. The missions of Kirkpatrick and Hamilton to Nepal; the expeditions of Hardwicke, Webb, Moorcroft, Fraser, and others to the source of the Ganges, with the application of the improved modern formulæ, at length fully established the fact. Although the height of the chain is every where stupendous, no part of it rivals those amazing peaks which tower on one side over the sources of the Jumna and the Ganges, on the other over those of the Sanpoo and the Indus.

4033. *Central Hindostan*, below its great mountain boundary, consists generally of a vast expanse of plain; but the southern part, composing the great *peninsula* between the Malabar and Coromandel coasts, though it cannot comparatively be called mountainous, is a very *hilly* country. Two great chains extend along the opposite coasts, parallel to each other, or rather diverging, and leaving between them and the sea only a plain of forty or fifty miles in breadth. They rise in few places above 3000 or 4000 feet high; but are very rugged and steep, and the entrance into the interior is only by very narrow and difficult passes. The name of Ghaut, which, through the Teutonic languages, has come to ours in the word *gate*, being applied to these passes, has been gradually extended to the mountains themselves. The most continuous chain is that of the Western Ghauts, which extends, for nearly 1000 miles, from Surat to Cape Comorin. It forms, evidently, the highest land of southern India, since all the great rivers flow across from it to the opposite coast. Though steep and stony, the hills are not broken, but covered generally with a stratum of earth, sustaining stately forests, particularly of bamboo, which is found nowhere else in equal perfection. The Eastern Ghauts seldom rise to the height of 3000 feet. Mr. Hamilton limits their extent to a line of about 300 miles from the Caverry to the Crishna; but, as a low chain runs from that river to the Godavery, which beyond rises again into a lofty barrier, almost closing the passage between the Circars and the interior, there seems little reason why the whole should not be considered as one continuous chain, almost equal in length to the western. The interior, between these two chains, consists chiefly of successive table-lands supported by the opposite Ghauts and by chains crossing from one to the other, diversified also by single precipitous eminences, which are formed into almost impregnable hill forts. One continuous chain, the Vindhya mountains, runs across the broad base of the peninsula, and forms a rugged boundary between it and the great plain of Hindostan Proper. On the west it is connected with a range of bold and lofty hills, which compose the territory of Rajasthan.

4034. *The rivers of Hindostan* form a feature no less important and celebrated than its mountains. The Himalayah, from its lofty magazines of tempests and snow, pours down a world of waters, which, every where

descending its steeps, unite at length in the two great branches of the Indus and the Ganges. These, with their tributaries, even before they reach the plain, present the mass and breadth of great rivers, while they retain the rapidity of mountain torrents.

4035. *The Ganges* holds a pre-eminent place among the rivers of Hindostan, and indeed of Asia; not, however, from the length of its course, which some others surpass, but from its watering the finest plains of this celebrated country. The Ganges has been represented as flowing out of the lake Manasarowara, when, after a long easterly course, it turned to the southward, and penetrated across the Himalayah. Mr. Colebrooke, however, considering these reports as very doubtful, sent, in 1808, an expedition to this spot, which has since been very fully explored by successive travellers. They have never, indeed, been able to penetrate into the mass of mountains piled upon mountains, from which the Ganges is first seen descending; but they have traced it till it appears a mere rivulet issuing from under beds of eternal snow. There cannot thus be the least doubt that it rises in the southern steeps of the Himalayah, and not in any point north of that chain. About thirty miles below Serinagur, the *prayaga* or junction takes place between the Bhagirath and the Alacananda, the two original branches of the Ganges; of which the former, though not of so long a course, is generally regarded as the original stream. About five hundred miles below, at Allahabad, it receives the Jumna or Yamuna, almost equal to itself, which has risen in a lofty peak not far to the west of its own source, and, by means of its tributaries, the Chumbull and the Betwah, has drained the southern side of the Vindhya mountains. From this side also it receives the Soane. But its main tributaries are from the north, as it runs parallel to the Himalayah mountains, the Gogra, the Coosy, the Gunduck, poured down from their steeps. After receiving this last stream at Monghir, it may be considered as having reached its greatest magnitude, being from one to three miles broad, and thirty feet deep. It is navigable without interruption to the mountain districts, considerably above Allahabad. The rise occasioned by the rainy season begins in the end of April, and continues to increase until the middle of August, when it reaches in many places thirty-two feet, and all the level districts on its lower course are inundated, sometimes for the breadth of one hundred miles. About 200 miles from the sea, the Ganges ramifies into a delta, of which the numerous branches, in entering the Bay of Bengal, form a labyrinth of channels and creeks called the Sunderbunds. In most of them, particularly those into which the largest branch divides, the force of the current is insufficient to clear away the bar of sand accumulated at the mouth. It is only by the Hoogly branch, which passes by Calcutta, that large vessels can penetrate.

4036. *The Indus, or Sind*, the western liminary stream of India, arises from very imperfectly known sources in the interior of Thibet. Its longest branch appears to be that called the river of Ladauk, which rises near the lake Manasarowara, and flows north-east to the above city, where it is swelled by the Shyook descending in an opposite direction from amid the snows of the mountain-range called the Kuenlun. It seems to have been by mistake that a branch, considered even as the real Indus, was supposed to join it at Draus. After descending from the mountains and passing Attock, where it is first considered an Indian river, the Indus, through all its remaining course, flows almost due north. The Kama here pours into it the mountain streams of Cabul and Caucasus; but its grand accession is about 400 miles farther down, where it receives in one united channel the waters of five streams celebrated in history; the Jelum (Hydaspes), the Chenaub (Acesines), the Rayee (Hydraotes), the Beya (Hyphasis), and the Sutledge (Hysudrus). These drain all the eastern steeps of the Himalayah, and the last mentioned even crosses it from a source in Thibet. The Indus now becomes a river of the first magnitude, about a mile in breadth, and from twelve to thirty feet deep, capable of receiving vessels of considerable burthen. It is estimated by Mr. Burnes to pour into the sea four times as much water as the Ganges. In its lower course it separates into two large branches, ramifying into many smaller ones, which enclose a delta about 70 miles broad, composing the kingdoms of Sinde and Tatta, part of which is extremely fertile, but that nearest to the sea consists of a desert of flat and marshy sand. These branches are so encumbered with sand, as to admit only flat-bottomed boats; but it is supposed that steam-vessels duly constructed might enter and reach as high as Moultan and Lahore.

4037. *The Brahmapoutra*, which forms the eastern liminary river of India, pours a vast body of water into the lower Ganges before its junction with the sea, where the two streams united form a bay with numerous islands. Modern geography has long identified it with the Sanpoo, and consequently assigned to it a long course along the table-plain of Thibet. But this origin is now generally discredited. Recent expeditions have shown it fed by waters descending from the southern side of the high mountains of Assam, though it remains still uncertain whether its principal branch may not come from beyond these ranges.

4038. *The Ganges and the Indus* finally absorb all the waters which descend from the southern face of the Himalayah; and these, flowing either eastward or westward over the vast plain of central India, leave between them a large expanse of arid desert bordering on the Indus.

4039. *All the other waters of India belong to the southern peninsula.* Beginning from the north, the first two that occur flow eastward into the Gulf of Cambay: the Nerbuddah, parallel to the Vindhya chain, and fed by its streams; and the Tuptee, which passes by Surat. There the chain of the western Ghauts begins, whence, as already observed, all the other large rivers flow eastward into the Bay of Bengal. The principal are the Godavery, the Crishna, and the Caverry; all sacred in the eyes of the Hindoo, and truly valuable by their services to irrigation and commerce. Though rivalling the great rivers of Europe, they hold only a secondary place in the geography of Hindostan.

4040. *It is somewhat remarkable* that, in so large a region, with so many mountains and waters, there should not be a lake, with the exception of Chilka on the Coromandel coast, which is a mere salt marsh, like the Mareotis or Menzaleh, and a few very small lakes in the territory of Rajpootana. To find this feature on a great scale, we must penetrate its northern barrier into central Asia.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

4041. I. *Himalayah.* — The Himalayah mountains may be divided, in a geognostical view, into three different zones. On approaching this colossal range from the plains, a sandstone formation is the first which arrests the attention, and forms the *first or lowest zone or belt*. This rock, which has a clayey basis, and is often in the state of conglomerate, is distinctly stratified, and the strata generally dip to the N.E. under 20° or 25°. It contains layers of coals, said to be of the lignite or brown coal family; which statement, if correct, renders it probable that the sandstone is much more recent than that of the great coal formation of Britain. This sandstone seldom attains an elevation of more than 3500 feet above the level of the sea, or 2500 feet above the plains at its base.

4042. To the sandstone succeeds the *second zone, or zone of slaty rocks*. These are at first *transition* clay slate with greywacke, and limestone enclosing remains of shells and corals; next *primitive* clay slate, which is succeeded by mica slate, in both of which occur talc slate, chlorite slate, beds of quartz rock, often of great magnitude, limestone or marble, potstone, and horneblende slate. The *copper mines* of these mountains are situated in the limestone

and potstone districts. Veins of porphyry are observed traversing the mica slate. This zone ranges in height from 1500 to 8000 feet. This tract is remarkable for attaining its greatest elevation on its northern and southern extremities, while between it is of less height; forming, in fact, if the mean surface only be considered, a sort of basin or trough. A peculiarity of geognostical structure accompanying this is the disposition along this lowest level of granite tracts or nuclei, each of comparatively small extent, frequently putting on the appearance of veins, and distributed at intervals along the line from the Kalee to the Sutledge. Generally the granite masses, being in the lowest tract, are themselves not very high; but an exception is found in the Chur mountain, which rises to a height of 12,000 feet, and forms the summit of a very lofty, extensive, and well-defined range. Gneiss is occasionally met with on the borders of these masses of granite, but never extensively; and beyond it again succeeds mica slate.

4043. The *third zone* is that of the Himalayah proper, the snowy ridge itself, and is composed principally of gneiss. It is distinctly stratified, and, like the sandstone, dips to the N.E. It is traversed by veins of granite, some of which are of considerable magnitude: various simple minerals, as garnet, schorl, cyanite, hyacinth, and native gold, occur embedded in it. Dr. Gerard collected fossil shells among strata beyond the region of slates which succeeded to the Himalayah gneiss in going northward. Some of them are said to resemble the *Producta scotica*, found in Scottish coalfields; some *pectens*, not unlike those met with in the *York lias*; a *terebratula*, differing but little from that found so abundantly in the *inferior oolite*, near Bath; an ammonite closely resembling the *Ammonites subradiatus* of Sowerby, which is a fossil of the *Bath oolite*: *belemnites* were frequently found, and of all dimensions; *orthoceratites* in a clay ironstone. Tertiary deposits are alleged to occur high among the mountains; and an interesting display of rocks of this class, containing remains of sea-shells and fishes, and mutilated fragments of bones of the genus *Anthracotherium*, of a kind of musk-deer, a viverra, &c., was discovered near Silhet, in the north-east corner of Bengal, and similar remains in some other points of the same province. Diluvium, with bones of various animals, is also mentioned as occurring in this mountainous region. Hitherto but small quantities of ore have been met with in the Himalayahs, and these are of copper, iron, lead, and graphite or black lead: of this latter, many are included under this head.

4044. II. *Middle India*. — This vast tract of country forms an inclined plane, of which the great declivity sinks gradually towards the mouth of the Ganges, while the other inclines towards the Indus. It is almost entirely composed of clays, loams, sands, and gravels, with occasional intermixtures of calcareous concretions named *kunkur*, fossil woods, and animal remains. In this division of India, we may include the coalfield of Damoda. This deposit of coal, which occupies both sides of the Ganges, through a considerable tract of country, and rests upon granite, appears to be geognostically the same formation as the coal formation of Britain. In the coal pits, of which there are but three sunk to a depth of ninety feet, there are seven beds of coal; one of them exceeds nine feet in thickness. The coal is said to resemble that of Sunderland, in England; but leaves a larger portion of cinders and ashes. It is now extensively consumed in and about Calcutta.

4045. III. *Peninsular India*. — *Primitive rocks*. A very large portion of the peninsula of India is composed of Plutonian rocks, as of granite, syenite, and trap, the Neptunian strata being much less abundantly distributed. The Neptunian deposits are gneiss, mica slate, clay slate, chlorite slate, talc slate, potstone, quartz rock, and limestone or marble. These deposits are variously upraised, broken, and otherwise changed by vast bodies of Plutonian rocks, of which the most abundant are granite and syenite, two rocks which together form very extensive tracts of country.

4046. *Transition rocks*. These occur abundantly, resting upon the primitive deposits, and frequently covered more or less deeply with secondary formations. The following rocks are mentioned by authors; viz., greywacke, clay slate, quartz rock, and limestone.

4047. *Secondary rocks*. Rocks of this class abound more in the northern than in the southern and middle districts of the peninsula. Old red sandstone occurs in considerable quantity, resting upon transition deposits: this formation in its turn supports mountain limestone, and rocks of the coal formation. These older secondary formations are overlaid, to a greater or less depth, with new red sandstone, and other rocks apparently belonging to the lias and oolitic series. The green sand and chalk deposits have not hitherto been met with. These secondary deposits are variously upraised, broken, and otherwise changed by secondary trap, which extends over vast tracts of country. The great western or Malabar chain of mountains, which commences in Candeish, and terminates at Cape Comorin, is at its northern extremity covered by a part of an extensive overlying trap formation, which extends in this quarter from the seashore of the Northern Concan to a considerable distance eastward, above and beyond the Ghauts, as far as the river Toombuddra and Nagpore. The trap hills are tabular, terraced, separated from each other by ravines, often of vast magnitude, and the whole frequently covered with splendid forests of teak and other trees, forming some of the most beautiful and romantic scenes in India.

4048. *Tertiary rocks.* Tertiary deposits, containing fossil trees erroneously said to be the tamarind tree, occur near Pondicherry; and clays and sands with sea-shells, asserted to be tertiary, are met with near Madras.

4049. *Alluvial rocks.* These occur generally distributed; and, in some places, the diluvium is of great thickness.

4050. *Minerals useful in the arts found in Peninsular India.*—*Granite and syenite.* These rocks, which occupy a great part of the Carnatic, Malabar, and Mysore, nearly the whole of the Nizam's dominions, and a large part of Bahar, are employed as building stones. *Talc slate* and *potstone* are employed by the natives for the manufacture of various utensils. All the fine plaster with which the walls of the houses are covered in India, and which is so much admired by strangers, is composed of a mixture of fine lime and soapstone rubbed down with water. When the plaster is nearly dry, it is rubbed over with a dry piece of soapstone, which gives it a polish very much resembling that of well polished marble.

4051. *Marbles* are quarried in different parts of the country, but nowhere extensively. The *laterite*, or brick stone, is used as a building stone, for which it is excellently fitted. Most of the handsome Roman catholic churches at Goa are built of it.

4052. *Gems.* The most valuable of all the gems, the *diamond*, occurs in alluvial deposits, as Cudapah, Banaganpelly, &c., in the river district of the Krishna; also in the bed of the river Godavery; at Sumbulpore, in the district of Mahanuddy; and at Pannah, in Bundelcund. *Corundum*, from its coarsest state to its finest, in the form of *Oriental ruby*, occurs in the granite and syenite district: the *spinel ruby* is also a native gem, and the same is the case with *zircon*, which occurs in alluvium in the Ellore district. *Schorlous topaz*, *tourmaline*, and *schorl*, occur in the granite and syenite districts. *Chrysolite* is an inmate of the secondary trap rocks; *precious garnet*, *pyrope garnet*, and *grenatite garnet*, are met with in primitive tracts of country, as also *rock crystal*, and various beautiful *felspars*. *Amethyst* and *catseye*, and many kinds of *carnelian*, *jasper*, and *agate*, are also natives of the peninsula of India. The annual value of carnelian exported from India formerly amounted to 11,000*l*. The secondary trap rocks afford beautiful and splendid specimens of different species of the elegant *zeolite* family. Metalliferous minerals occur but in small quantities. *Gold* and *silver* are but sparingly distributed; *iron* is abundant, but hitherto its ores have not been mined to any considerable extent. There are, at present, *no copper mines* of any importance, although the general use of copper or brass utensils among the natives of India, and the preference given to them before all other kinds of vessels, would seem to show that this metal was mined much more extensively in former times.

SUBJECT. 2. Botany.

4053. *British India*, notwithstanding its vast extent, its varied vegetation, and great importance to our country, must, inasmuch as regards its botany, be passed over in fewer words than we could wish. The present volume would not suffice to contain half of what is known of the useful or curious vegetables with which botanists are now acquainted, through the indefatigable exertions of a few individuals, whose names, nevertheless, deserve to be recorded, even in this brief notice. Only forty years ago, and nothing was ascertained, comparatively speaking (save through the medium of the *Hortus Malabaricus*), of the vegetation of this vast country, extending from near the equator to at least the thirteenth degree of north latitude, and from the sixty-third to the ninety-sixth degree of east longitude. In 1793, Dr. Roxburgh was appointed to the charge of the botanic garden at Calcutta; which includes within its boundaries an area of 300 acres; and this gave rise to the *Hortus Botanicus Calcuttensis* and the splendid *Plants of Coromandel*. Between the years 1820 and 1824, the learned and excellent missionary Dr. Carey edited the two volumes (extending no farther than the class Pentandria and order Monogynia) of *Flora Indica*, from the MSS. of Dr. Roxburgh, Dr. Wallich, and Dr. Jack. For a short period, during the illness and consequent absence of Dr. Roxburgh, Dr. Francis Buchanan Hamilton was appointed to the care of the Calcutta garden. To him succeeded, on his decease, Dr. Wallich, whose assumption of this office forms a new era in the botany of India. This gentleman, a pupil of the celebrated Hornemann of Copenhagen, brought a degree of zeal to the duties of his situation which is rare in any country, and certainly unequalled in a tropical climate. At his suggestion, the Honourable Directors of the East India Company placed the garden establishment upon a footing far surpassing any thing of the kind known in Europe. The spot of ground is no less than five miles in circumference, and upwards of 300 gardeners and labourers are employed in the charge of it. Gardens, in connection with it, have been formed in other remote parts of the Indian possessions; collectors have been sent out to discover new and especially useful plants; and the residents and other gentlemen attached to science were invited to transmit the vegetable productions of their respective districts to Calcutta, both in a living and dried state; and among these, the Honourable Mr. Gardner, long the Company's Resident at Silhet, furnished most extensive and valuable collections.

4054. In 1820, Dr. Wallich himself undertook a journey to Nepal, in order to investigate and procure its rich stores for the garden and herbarium. This occupied eighteen months;

at the expiration of which, while descending the plains on his return, he was attacked with fever, that compelled him to make a voyage for the recovery of his health. Even this forced absence was rendered subservient to the cause of science. Dr. Wallich visited Singapore and Penang, and returned to Calcutta, enriched with new treasures. In 1820, Dr. Wallich was engaged in inspecting the vast timber-forests of the western part of Hindostan, and collecting the plants of the kingdom of Oude, &c. His last important excursion was to Ava, immediately after the reduction of the Birman empire. Here an entirely new field was laid open to his view; and when the collections of this vast and fertile country were added to those already deposited in Calcutta, the mass was estimated at 8000 or 9000 species. Of the difficulty of preserving dried plants in an Indian country, few can possibly form an idea, except by actual experience. In addition to the coleopterous insects, which in all climates commit most provoking ravages on these vegetable mummies, the ants are ready in the tropics to devour both the specimens and the paper in which they are preserved. To secure them from these attacks, the only remedy is to have the cabinets insulated, by setting the feet of them in troughs of water. But so rapid is evaporation under an Indian sun, that it was the entire office of a Hindoo, after entering the museum and performing his salaam to Dr. Wallich in a morning, to go the round of the room and replenish these troughs with water as fast as it evaporated, until the cool shadows of evening came on, and relieved him from his tedious and monotonous task.

4055. *With this vast herbarium*, with many seeds and chests of living plants, but with a constitution greatly enfeebled by a residence of twenty years, and incessant mental and bodily fatigue in fulfilling the duties of his important office, Dr. Wallich arrived in England in the autumn of 1828. Here he expressed the generous wish that all the civilised world should benefit as much as possible by his exertions, and that the duplicate specimens, which were exceedingly numerous, should be divided among the principal botanists, who are also invited to take a share in the publication of those genera or families with which they are most conversant. The large apartments of a house in Frith Street scarcely sufficed for the reception of the collections, which, however, began to be rapidly reduced, as the distribution, which was made in different portions, proceeded. In this dispersion, though aided by the most zealous botanists in England, and by M. A. Decandolle from Geneva and Professor Kunth from Berlin, Dr. Wallich's personal labour has been very great, yet he scarcely relaxed for a single day. The entire examination of many species, in order to the formation of a complete catalogue, with numbers corresponding to the specimens distributed, was in itself a work of no ordinary stamp; and this has been executed in lithography, and written with Dr. Wallich's own hand. But his *magnum opus*, and that on which Dr. Wallich's fame as a botanist may alone safely rest, is his *Plantæ Asiaticæ Rariores*; a work which, whether for the beauty or rarity and interest of the subjects, the execution of the plates, or the accuracy of the descriptions, is surpassed by no publication of this or any other period. It is now brought to a conclusion, and hardly possible is it to conceive how Dr. Wallich can have accomplished so laborious a task, amidst all his other important employments.

4056. *Dr. Wight* is another gentleman to whom the botany of India is greatly indebted. To his able charge was intrusted the Company's garden at Madras, so long as this establishment, which, we lament to say, was of short duration, continued: thus giving this gentleman, as it were, the same command over the vegetable productions of the southern peninsula of India which Dr. Wallich enjoyed over those of Hindostan Proper; and no man could have made better use of those advantages. Both during the continuance of the institution and after its abolition, during many long, painful, and most expensive journeys, he made ample collections, and has employed, and still continues to employ, at his own charge, an excellent draughtsman. In the year 1831 he arrived in London with an herbarium of 4000 species, and probably 100,000 specimens of plants of the presidency of Madras, which he is engaged in preparing for publication, and is generously distributing among European botanists, after the example of the Honourable the Directors of the East India Company.

4057. *While these sheets are in the press*, another excellent botanist, Mr. Royle, has arrived in London, from a most interesting district near the northern limit of the British territories in India, namely Scháranpúr, where an institution, similar to that above mentioned, as being in charge of Dr. Wallich, has been taken under the protection of the Honourable East India Company. In the year 1779, Tabita Khan first appropriated the revenues of seven villages for the maintenance of a public garden; an income, however, which was much reduced by the native princes, his successors. The Marquess of Hastings, with the enlightened views of a statesman, determined that what had been intended for the gratification of an Asiatic sensualist should contribute to the advancement of science, at the same time that it was a means of increasing the comforts of the people, and administering to the tastes of the most civilised Europeans.*

* See an account of the Honourable Company's Botanical Garden at Scháranpúr, by F. Royle, Esq., late superintendent; published in the Journal of the Asiatic Society, February, 1832.

4058. *The situation of Scháranpúr*, in point of latitude, elevation, vicinity to the hills, and the facility of irrigation from the Doub canal, renders it particularly eligible for such a purpose; in short, in latitude 30° , the same parallel which passes through Persia, Arabia, Egypt, and over the southern boundaries of Libya, Barbary, and Morocco, by New Orleans, between Old and New Mexico, and passing through the very centre of China and Thibet. The elevation, too, 1000 feet above the level of the sea, renders the climate particularly favourable for the introduction into India of plants from the more temperate countries. The state of the atmosphere, indeed, for nearly six months in the year, is so similar to that of Europe, that most of the annual plants from that country may be successfully cultivated, while the cold is not sufficiently great, or of long continuance enough, to destroy the more southern plants, with the exception, indeed, of such tropical ones as cannot bear frost.

4059. *The best crops of European and medicinal plants*, Mr. Royle tells us, are obtained from seed sown in November; after which the weather becomes steadily colder till Christmas, when some heavy rains usually fall. During this season the growth of perennial and of herbaceous plants from warm climates is checked; but in March a rapid rise takes place in the mean temperature of the month, and the increase, amounting to 42° of Fahrenheit, affords a powerful stimulus, and rapidly accelerates the vegetation of spring. About the middle of April the hot winds begin to blow, and continue to do so till the beginning of June, when the rainy season commences, and according as it terminates, towards the beginning or close of September, depends the late or early diminution of temperature which ushers in the cold weather.

4060. *The mean temperature of Scháranpúr* throughout the year is about 73° Fahrenheit, and of the months of

January 52° ,	May 85° ,	September 79° ,
February 55° ,	June 90° ,	October 79° ,
March 67° ,	July 85° ,	November 64° ,
April 78° ,	August 83° ,	December 55° .

4061. *With a zeal that does him the highest credit*, Mr. Royle has introduced to this garden a great number of exotics. From China, the Litchi, Loquat, Wampu, Longan, Flat Peach, and Digitated Citron, the *Spiræa corymbosa*, *Dianthus chinensis*, *Rosa chinensis*, and *Althæa rosea*. — From America, the Mahogany, Logwood, Sapota, Cherimoja, Ash-leaved Maple, Pimento, and Dahlias. — From Africa and New Holland, Aloes, Pelargonias, *Stapelia*s, *Amaryllis*, *Casuarina*, *Cajaputi*, &c. The Barley of the hills, called *oaa*, from an elevation of 10,000 feet above the level of the sea, has become perfectly naturalised in Scháranpúr, and a singular species of Wheat from Kanáwar, at an equal elevation, succeeds remarkably well. Fiorin Grass is there seen by the side of the Guinea Grass and Lucerne, Succory and Clover, in a thriving state. Many precious medicinal plants are already cultivated, and it is hoped that many more will be introduced. Among the former may be mentioned Rhubarb; the long-leaved Fir, which yields by distillation a valuable oil of turpentine; Henbane, of which the extract is of a very superior quality; Senna, &c. Among timber trees are the Teak, Saul, Toon, Lissoo, Seriss Maple, *Casuarina*, Bamboo, Jasmine, and Mulberry. From the Saul tree above mentioned a very excellent resin is produced; while various gums are yielded by several trees, from the lower hills, now naturalised at Scháranpúr. The fine sugar, for which this district is noted, is chiefly refined by the mucilage of two plants, the *Kydia calycina* and *Hibiscus Abelmoschus*.

4062. *Our knowledge of the geographical distribution of plants*, too, is considerably extended by the establishment of this garden; for its able superintendent has most successfully explored the country in its vicinity, and, indeed, in the northern provinces of India, especially from the tract of country running along the Ganges and Jumna, from Allahabad up the Sutláj, and from the low range of hills which skirt the Himalayah as well as those of Deyra Dun; again from that part of the Himalayan range extending from the plains to the sources of the Ganges and Jumna, and included between the former river to the east and the Sutláj to the west; from Kanáwar, a place lying along both sides of the Sutláj within the British territories, but beyond the snowy passes of the Himalayah, and likewise from the valley of Cashmere, whence Dr. Royle has received living bulbs of the "Saffron" of commerce, and roots of the true Salep Orchis, or *Misvi*. — The number of species collected amount to nearly 4000; namely, of

Dicotyledones	2791
Monocotyledones	783
Acotyledones -	279

————— 3853

It is to be hoped that ere long Mr. Royle will gratify the botanical world with an account of these interesting plants; and in the mean time, under our next head, we shall offer the result of M. Mirbel's general and very cursory observations on the vegetation of Himalayah and the southern limits of Thibet.

4063. *After all that we have stated* of the labours of the above-mentioned botanists, it cannot admit a doubt but that we shall soon be better acquainted with the plants of British India than we are with those of many countries much nearer home; and it is very gratifying to observe that their attention has been especially devoted to the more useful kinds. Of

such, the number in British India is very considerable, and their value might be still greatly increased by British capital and British industry, as is clearly shown in a very sensible anonymous pamphlet lately published, under the title of a "View of the present Trade and Colonisation of India;" where it is rendered equally apparent that to the same cause is to be attributed the absence of the useful plants of other countries similarly situated in regard to soil and climate; while those very countries—witness our possessions in the West Indies, the Spanish, Portuguese, French, English, and Dutch settlements in South America—have introduced and carried to a very high degree of perfection the culture of many of the most important commercial products of the East: so that one would think they were aboriginal to the New World. "What but the exclusion of European settlement hinders, in our Indian dominions, the extensive culture of the peculiar productions of America and even of China? The indigenous products of India have been transferred to America, and there, under the direction of European skill, they far surpass in goodness and quantity those of their original country: witness the Sugar-cane, the Cotton-plant, Coffee, Rice, and even Indigo, until, in its native country, the production of this last fell into the hands of Europeans. Have the Indians retaliated upon the American colonists? Where is our Indian Annatto? Where is our Indian Cocoa; our Indian Vanilla? The hardy plant producing the Annatto (*Bixa Orellana*), introduced from America, is to be found as a garden plant throughout India, but the drug obtained from it is wholly unknown to the Indians as an article of commerce. The plant producing the Cocoa, although cultivated in the Spanish and even in the Dutch East Indies, is unknown in the British possessions. The cochineal insect and the plant (*Cactus cochinnellifer* Bot. Magazine) that it feeds upon, introduced into British India by an ingenious European, have, in rearing and culture, reverted to the hands of nature and the care of the Indians; and Mexican Cochineal, consequently, exceeds it in value by full 500 per cent.

4064. "India is in a similar predicament in regard to China. Situated close to that country; in daily close intercourse with it; receiving yearly into our settlements thousands of emigrants from thence; having a population of cheap labourers, by character peculiarly adapted to the tedious manipulation indispensable to the preparation of tea, — an advantage which no other colony enjoys, or is likely for a long time to enjoy; and possessing the same soils, climates, and physical aspects as the most favoured of the tea provinces of that empire, not one pound of tea has ever been grown in our Indian possessions; not one attempt has been made to rear this valuable plant in British India, while such efforts have been frequent in distant and uncongenial European colonies. Owing to the superior skill of the Chinese, both as agriculturists and manufacturers, they are enabled to export a large quantity of sugar, of quality much superior to that of India, though having to contend against the high rents incident to a country fully peopled, and where the price of corn is, probably, not less than threefold as great as in the average of the Indo-British dominions."

4065. The forests of India are, it is well known, upon an extensive scale; and little, comparatively speaking, as has yet been ascertained of the species of trees they contain, the indefatigable Dr. Wallich has, chiefly by his own industry, and the various missions in which he was employed in various parts of India, to Nepal and the Himalayah mountains, and in the Birmese territories, together with what are grown in the Calcutta Botanic Garden, collected no less than 456 different species of Indian wood, which he has deposited, with the sanction of the Directors of the Honourable East India Company, in the museum of the *Society of Arts*, in London; and of which an account is given in the forty-eighth volume of the *Transactions* of that Society. Of these a large proportion are employed by the natives. Among them is the superb *Butea frondosa* (fig. 597.), from Gualpacá: two species of *Careya*, from Nepal;

597

BUTEA FRONDOSA

six species of Chestnut, one of Hornbeam, two *Cedrelas*, a genus nearly allied to mahogany; a *Croton*, five cubits in girth; two species of *Daphne*, *D. Gardneri* and *D. cannabinum*, of which the wood, indeed, is not used, but the inner bark is, in Nepal, most extensively manufactured into paper, which possesses the advantages of being strong, not liable to crack, and which is free from the attacks of the white ant; *Dipteronitis grandiflora*, a stupendous tree, one of those which yields wood, oil, and dammar; five species of Spindle tree; numerous kinds of Fig, but whose wood is usually light and of comparatively little value; an Ash (*Fraxinus floribunda*), whose wood is exactly similar to the Ash of our country; *Gmelina arborea*, used for turnery-ware of all kinds, and cylinders of which, of a proper size, are turned very thin for drums, other musical instruments are also made of it; *Gordonia integrifolia*, of which the Birmese have a superstition that one beam in every house should always consist of its wood; three Hibisci, *Hopea tinctoria*, which grows to an enormous

size, of which cannons are made, and which produces a valuable resin or dammar; a Holly, a Walnut, "an exceedingly large tree;" a Juniper, from Himalayah; three species of the beautiful Lagerstrœmia, several of Laurel, a Privet, which constitutes a "timber;" a Magnolia, two kinds of Mulberry, three of Nutmeg, whose wood is extensively used; a large Olive; five species of Pine, natives of Nepal, one of which, *Pinus Deodora*, yields a fragrant wood; the very large Pine of Tawey (*P. Dammara*?), a tree-fern of Nepal forty-five feet high, *Polypodium giganteum*; three species of Plum, four species of *Pyrus*, ten of Oak, of which the *Quercus semecarpifolia* becomes a very large tree, having a clean trunk eighty to one hundred feet in height, and fourteen to eighteen feet in the girth at five feet from the ground; a Buckthorn, whose wood is very hard and heavy, not unlike English Yew; three Rhododendrons, among them the splendid *R. arboreum*, of which gun-stocks are made, and which resembles a Plum-tree, a *Rubus* (or *Bramble*), as thick as a stout man's arm; three Willows, among them the Weeping Willow (*Salix babylonica*), which in Nepal attains an enormous size; *Shorea robusta* (fig. 598.); Saul, or Sole, the staple timber of

Hindustan for building purposes, vast quantities of dammar or resin are extracted from it, as well as from *Dipterocarpus* and *Hopea*, all of which belong to one family, the *Dipterocarpeæ*; a Yew; and, lastly, we shall only further mention the Teak (*Tectona grandis*) (fig. 599.), of which ships are extensively built, and these are said to be quite equal to those built of oak; the trunk attains an enormous size, and the leaves are of a foot and a half or more long.

SHOREA ROBUSTA.

TECTONA GRANDIS.

4066. Notwithstanding the abundance of valuable timber yielded by our Indian possessions, none is ever exported; and though there is a prodigious extent of forest, neither pot nor pearl ashes have ever been manufactured. Yet America produces no less than 18,479 tons of pot and pearl ashes, worth 430,038*l.*; and England and her colonies form the principal market for them: to the latter, no less than 13,322 tons out of the above-mentioned quantity were exported.

4067. Cotton (*Gossypium herbaceum*) (fig. 600.) is a native of the East Indies, and extensively cultivated; so that, in 1818, 67,456,411 lbs. were imported into Great Britain; but the quality is very inferior to that of other countries: the best of it in the London markets is worth 3*d.* per lb. less than the best West Indian cotton. It is half the value of Barbice cotton: that from Pernambuco, and the modern Egyptian cotton, are reckoned to be 60 per cent. better: and this inferiority, again, is attributed to the ignorance and prejudices of the Hindoos. It is indeed extraordinary that, admirably as the East Indies are calculated for the growth and exportation of cotton, out of 197,544,880 lbs. the average import of the years 1827 and 1828, the United States furnished - - - 151,834,000

Brazil	-	-	-	-	17,754,880
Egypt	-	-	-	-	6,957,800
The West Indies (our own dependencies)	-	-	-	-	9,010,560
And the East Indies	-	-	-	-	11,987,040.

4068. Sugar, the produce of *Saccharum officinarum*, (fig. 601.) is equally a native of the East Indies, and is, in fact, more or less an object of agriculture in every considerable country of the vast regions comprehended under that name, from the 8th degree of south to the 30th degree of north latitude, and from Persia to China, both inclusive. Of all this wide extent, it is universally allowed that no portion is more suitable to its growth than our own possessions. To obtain sugar in abundance, and of the best quality, nothing more is requisite than to remove the idle and pernicious restraints on the settlement of Europeans. But, as matters stand now, of 38,390,536 lbs. of sugar, imported into Great Britain

COTTON TREE.

from the East Indies in 1826, no less than 20,859,440 lbs., or more than half of the whole amount, was the produce of the island of Mauritius. "That is to say, the imports

601

SUGAR CANE.

into this country from a small island, with an area of 372,528 acres, one eleventh part only of which is under any culture, and one fifteenth only under the culture of the sugar-cane, — the imports from an island with a somewhat precarious climate, and a fertility of soil not very distinguished, — the imports from an island that at the utmost contains a population of no more than 95,000 inhabitants, — and, finally, the imports from an island, of which the British nation had possessed the sovereignty but twelve short years, are greater, in the grand staple of the tropical world, not only than those of all British India, of which we have possessed the sovereignty five times as long, with its area of 600,000 square miles, its population of 83,000,000, its fertile soil and its genial climate, but larger than those of the whole Eastern world put together (the said small island excepted), embracing a population of certainly not less than 300,000,000 people!" And this inequality is not owing to the difference of duty between Mauritius and the other East Indian sugars: this is not the cause that the trade in the one article is stationary, and in

the other advancing with an extraordinary rapidity of increase. A new soil, as yet unexhausted by bad husbandry, the introduction of European machinery, and the superintendence of European resident proprietors, are the true causes.

4069. *Indigo*, a staple article of the East Indies, one of the most valuable of its products, and one of the most profitable of cultivation in all Hindostan, is yielded by the *Indigofera tinctoria* (fig. 602.); and it is in that country so lucrative, because an immense extent of

602

INDIGO.

land is required to produce but a moderate bulk of the dye; because labour and land are cheaper here than any where else; and because the raising of the plant and its manufacture can be carried on even without the aid of a house. The first step in its cultivation is to render the ground, which should be friable and rich, perfectly free from weeds, and dry, if naturally moist. The seeds are then sown in narrow drills, about a foot apart. The rainy season must be chosen for sowing; otherwise, if the seed is deposited in dry soil, it heats, corrupts, and is lost. The crop, being kept free from weeds, is fit for cutting in about two or three months, and this may be repeated in rainy seasons every six weeks. The plants must not be allowed to come into flower: as the leaves, in that case, become dry and hard, and the indigo produced is of less value; nor must they be cut in dry weather, otherwise they will not spring again. A crop generally lasts two years. Being cut, the herb is first

steeped in a vat, till it becomes macerated, and has parted with its colouring matter; then the liquor is let off into another, in which it undergoes the peculiar process of beating, to cause the fecula to separate from the water. This fecula is let off into a third vat, where it remains for some time, and is then strained through cloth bags, and evaporated in shallow wooden boxes, placed in the shade. Before it is perfectly dry, it is cut into small pieces of an inch square; and finally packed into boxes or sewn up in bags for sale. Indigo was not extensively cultivated in India before the British settlements were formed there; its profits were, at first, so considerable, that, as in similar cases, its culture was carried too far, and the market was overglutted with the commodity. The indigo is one of the most precarious of Oriental crops; being liable to be destroyed by hailstorms, which do comparatively little injury to the sugar cane and other plants. European skill and capital have been, in India, especially applied to its management for nearly fifty years. What was manufactured by the natives of India, prior to that time, was trash, unfit for the European market, then almost wholly supplied by South America, which furnished England with about 1,200,000 lbs. weight. There are at present, in Bengal, 309 manufactories of indigo for exportation, of which thirty-seven only are conducted by natives, and these in imitation of the European process. The Indians, however, cannot even imitate us to any advantage, with so many examples before them, and in full possession of all the land, to the complete exclusion of their competitors; for the indigo thus prepared is full 15 per cent. lower in value than that manufactured by Europeans; and as to indigo made by the old native process, it is still wholly unfit for the foreign market; and even when re-manufactured by Europeans, which is sometimes done, it is still, from the deterioration it has undergone in their hands, a very inferior commodity. The average yearly quantity of indigo produced for some time back in the

British dominions in India, has ranged from 8,500,000, to 9,000,000 lbs. weight, and in value from 2,700,000*l.* to 3,300,000*l.* The produce of 1828, the greatest ever known, amounted to 12,000,000 lbs. Before Europeans undertook the culture and manufacture of Indian indigo, it was, as already stated, so bad as to be unsaleable in any foreign market. On an average, it is now about twelve and a half per cent. better than South American indigo. In short, about four fifths of the consumption of Europe, Asia, and America is now supplied with good Indian Indigo; a commodity which, fifty years ago, had no existence.

4070. *Cajeput oil* is obtained from an East Indian shrub, the *Melaleuca Leucadendron*, and, in a pure state, is considered one of the best of preservatives of preparations for natural history. It is used externally, and with much success, as a cure for rheumatic affections and pains in the joints. In India, too, it has been employed in the almost hopeless task of curing the cholera morbus. When that disease first broke out in England, and indeed before it actually made its appearance, Cajeput oil was in such demand, that the price rose to a most extravagant height. But when its inefficiency was unfortunately proved, it was soon reduced to its ordinary standard.

4071. *Caoutchouc*, or Indian Rubber, is the inspissated juice, not only of several species of *Ficus*, but of the *Urceola elastica* of Dr. Roxburgh, or Elastic Gum Vine. To the

same natural order with the latter belongs the *Strychnos Nux Vomica* (*fig. 603.*) (the *Poison nut* or *Vomic nut*), whose seed is among the most powerful of all vegetable poisons: yet the pulp of the fruit appears to be innocuous, being eaten by birds, &c. Of the same genus is the *Cleansing Nut* (*Strychnos potatorum*). "The ripe seeds," says Dr. Roxburgh, "are dried and sold in every market to clear muddy water. The natives never drink clear well-water, if they can get pond or river water, which is always more or less impure, according to circumstances. One of the seeds or nuts, as they are generally called, is rubbed very hard, for a minute or two, round the inside of the vessel containing the water, which is generally an unglazed earthen one, and the water left to settle; in a very short time the impurities fall to the bottom, leaving the water clear, and, so far as I have been able to learn, perfectly wholesome."

4072. To the *Fig tribe* belongs the famous Banyan of India, commonly called Peepul tree, and constantly planted about the Hindoo temples (*Ficus religiosa*) (*fig. 604.*): —

"Branching so broad and long, that in the ground
The bended twigs take root, and daughters grow
About the mother tree, a pillar'd shade
High over-arch'd, and echoing walks between."

These roots or props occupy such a space of ground, that one growing on the banks of the Nerbuddah covers an almost incredible area. The circumference which now remains (for much has been swept away by the floods of the river) is nearly 2000 feet. The overhanging branches, which have not yet thrown down their props or supports, overshadow a much larger space: 320 large trunks are counted of this singular tree, while the smaller ones exceed 3000; and each of them is continually sending forth branches and pendent roots, to form other trunks, and become the parents of a future progeny. The whole, according to Forbes's *Oriental Memoirs*, has been known to shelter 7000 men beneath its wide-spread shade.

4073. No less gigantic, as a grass, than the Banyan as a tree, is the Bamboo (*Arundo Bambos*) (*fig. 605.*), whose jointed stems or culms not unfrequently exceed 100 feet in height with a diameter of a foot near their base. It is of the most rapid growth, clothed, especially at the top, with copious dark green foliage, and literally constitutes forests. It is one of the most extensively useful of all plants, where lightness and durability

are required. Houses are built of this cane, and Dr. Patrick Browne assures us that they have been known to endure upwards of 100 years. Besides masts for boats, boxes, cups,

BAMBOO.

baskets, mats, palankeens, and carriages, and a great variety of other utensils and furniture, both domestic and rural, are made of it. Paper is prepared from it, by bruising and steeping in water, when it becomes a paste. It is the common fence for gardens and fields, and is frequently used for water pipes.

4074. Ginseng (*Panax Ginseng*) (fig. 606.), which constitutes a valuable article of trade in China (though its medicinal properties are

GINSENG.

grossly exaggerated by that extraordinary people), and the root of a nearly allied species of which (*P. quinquefolia*) has been sold by the Americans in one season (1824) to the amount of 39,064*l.*, might, there is every reason to believe, be collected to great advantage in Nepal; and this has been suggested by Dr. Wallich, who published the species, under the name of *Panax tetraphylla*, in his splendid work, *Plantæ Asiaticæ Rariores*.

4075. Sandal wood (*Santalum album*) (fig. 607.), the produce of a well known fragrant

SANDAL WOOD.

tree, is extensively collected in the western part of India, on the coast of Malabar. In some parts it sells at so high a price that the tree is seldom allowed to grow more than a foot in diameter. It is manufactured into musical instruments, small cabinets, boxes, escritoirs, and similar articles; as no insect can exist, nor iron rust, as it is said, within its influence. From the dust of this wood the Bramins make the pigment which they employ in giving the frontal mark to their god Vishnu: and oil used in their ceremonies is obtained from the shavings, or at least scented with them.

4076. The *Valeriana Jatamansi* (fig. 608.) (*Nardostachys Jatamansi* of De Candolle) abounds in the hilly parts of Nepal, and is determined by Sir W. Jones to be the true Spikenard of the ancients, or Indian Nard of commerce, and has been employed as a valuable perfume from the remotest antiquity.

It is carried across the desert to Aleppo, where it is used, in substances, mixed with perfume, and worn in small bags, or in the form of essence, and kept in little boxes or phials, like attar of roses.

4077. Still lakes, pools, and tanks of water, in various parts of India, abound with many highly curious aquatic plants. Water-lilies of different hues are very common, and one

VALERIANA JATAMANSI.

is rendered famous in history, namely, the *Cyamus Nelumbo* (fig. 609.) or Sacred Bean of India, the *kvamos* of the ancients, whose splendid flowers, of a full rose colour, are embosomed in large peltate leaves of the tenderest green, and which, as well as the flower-stalk, rise considerably above the surface, not floating like the water-lilies of our country. Sola, too, is an aquatic plant, of which an interesting account is given by General Hardwicke, in the *Botanical*

SACRED BEAN OF INDIA.

Miscellany. "It has very often interested me, and gratified my curiosity," says that gentleman, "to remark to how many useful purposes the Sola is applied by the natives of India. It is the *Æschynomene paludosa* of Roxburgh. It grows abundantly on the

marshy plains of Bengal, and on the borders of *jeels*, or extensive lakes, in every province between Calcutta and Hurdwar. The plant is perennial, of straggling low growth, and seldom exceeds a diameter of two inches and a half in the stem. It is brought to the Calcutta bazaars in great quantities in a green state; and the thickest stems are cut into laminæ, from which the natives form artificial flowers and various fancy ornaments to decorate their shrines at Hindoo festivals. The Indians make hats of it, by cementing together as many layers as will produce the requisite thickness: in this way, any kind of shape may be formed; and when covered with silk or cloth, the hats are strong, and inconceivably light. It is an article of great use to fishermen; it forms floats of the best description to their extensive nets. The slender stems of the plants are bundled into fascines about three feet long; and with one of these under his arm does every fisherman go out to his daily occupation. With his net on his shoulders, he proceeds to work without a boat, and stretches it in the deepest waters and most extensive lakes, supported by this buoyant faggot. I must not forget to give you the native name of the plant, which in Bengalee is Shola, commonly pronounced Sola. Dr. Roxburgh considered the plant as annual, I believe. The foliage, and other parts of the plant, where water is wanting, die down to the roots; but where water is plentiful, the stems remain, and branch out afresh in the proper season."

4078. Lastly, we shall mention, among the grandest features of Indian scenery, the Palms, those princes of the vegetable kingdom, which administer to so many of the wants and

COCOA NUT.

luxuries of the natives, and which are not confined to the hottest parts of the country; for one species, the *Chamærops Martiana* of Wallich's *Plantæ Asiaticæ Rariores*, was found by that famous botanist in the valley of Nepal, in lat. 28° N., and at an elevation of 5000 feet above the level of the sea. The south coast of India abounds with the Cocoa-nut (*Cocos nucifera*) (fig. 610.), of which the Hindoos celebrate 365 uses that they derive from it. Far superior to this, in the magnitude of its leaves, of which a single one will shelter twelve men, is the Palmyra Palm (*Borassus flabelliformis*) (fig. 611.), which sometimes attains to 100 feet, while its trunk yields abundantly the Toddy or Palm wine. The *Caryota urens*, in the diameter of its stem, which is three feet; and the Betel nut (*Areca Catechu*), in the gracefulness of its trunk and foliage, also excel the cocoa-nut. The fruit of the latter is eaten with the pungent leaf of the Betel pepper already mentioned, whence arises its appellation of Betel-nut Palm. Dr. Roxburgh describes a dwarf palm, under the name of *Phoenix farinifera*, which yields a farinaceous substance in the heart of the stem or

cabbage, similar to the Sago of the shops. This latter substance is the product, it would appear, of two plants, the *Sagus farinifera* (fig. 612.), a native of the peninsula of India, and the *Cycas revoluta*, a Chinese and Japanese plant.

PALMYRA PALM.

SAGUS FARINIFERA.

4079. *Himalayah, and the southern boundary of Thibet.* * — The chain of the Himalayah mountains, an immense barrier which divides the population, the animals, the vegetation, and the climate of the East Indies and Southern Asia, begins, easterly, not far from the river Barrampooter, or Brahmapoutra, about lat. 28° , and extends in a north-west direction as far as the Indus, lat. 35° . In the south it rises abruptly from the plains of Nepal; to the north, it is nearly on a level with the high ground of Thibet. The highest known mountains belong to this chain: they are situated between the 28th and 32d parallels. Mr. Colebrooke has deduced the following elevations from the observations of Captain Blake; viz., the Peak of Chandragiri, 21,935 feet; that of Swelagar, 25,261 feet; that of Dewalagiri, 28,015 feet; this latter peak exceeding Chimborazo by 6000 feet. Fraser estimates the height at which the snow becomes perpetual on the Himalayah mountains at from 14,000 to 16,000 feet; an elevation which is surprising at a distance of from five to nine degrees from the tropics, but which may be explained by the peculiar conformation of this Asiatic region. While large sheltering chains of mountains, running almost parallel with the equator, and rising like steps, one above another, from the north of Siberia to Nepal, break and arrest the currents of cold air which descend from the hyperborean country; on the other hand, the warm breezes from the vast plains of Hindostan sweep gently upward on the easy slopes of the Himalayah mountains, and reach the higher regions without intermixture or contact with the northern atmosphere; thus causing the Himalayan range to partake of the equatorial zone, in the character of its climate and vegetation.

4080. *The lower plains of Nepal and Boutan* differ little from Hindostan in their vegetation. Warmth and constant moisture keep up a sempiternal verdure; the cultivated spots produce, at the same time, the Mango, the Orange, the Pomegranate, the Peach, the Apple and Pear, the Walnut tree, the Banana, the Bamboo, &c. The *Erythrina monosperma* and *Bombax heptaphyllum* are the most common trees in uncultivated spots. The forests of the lower ridges of the Himalayah mountains are composed particularly of *Shorea robusta*, mixed with *Dalbergia*, *Cedrela*, &c. At an elevation of from 2000 to 2500 feet, the *Pinus longifolia* and *Mimosa Catechu* grow. At this height, in about $27^{\circ} 17'$ N. lat., Hamilton computes the mean annual temperature at $+23^{\circ} 3'$. In proportion as the ground rises, the species of plants that belong to the plains of Hindostan become rare, and those which are peculiar to the mountains usurp their places. The vegetation imperceptibly assumes the generic character of the productions of the north, while it still presents a number of specific types that are foreign to our country. The Pine Apple, Sugar Cane, Bamboo, and Rice are still cultivated in the valleys, at an elevation of from 3200 to 4400 feet: but beyond 6300 feet nothing but barley, wheat, millet, and the other grain of northern zones, will succeed. The common trees are species of *Michelia*, *Gordonia*, Fir and Pine trees, *Podocarpus*, Chestnut, Oak, Walnut, Laurel, Ilex, &c.

4081. *There is never either frost or snow in Boutan*, except on the high mountains; but at Katmandu (lat. $27^{\circ} 41'$), the capital of Nepal, at an elevation of about 4000 feet, it snows every winter. In that part of the Himalayah range which looks towards Hindostan, and on the southern frontier of Thibet, Fir, Spruce, Juniper, *Salix tetrasperma*, Birch, &c. attain a great height, when not arrested by the sterility of the soil, the precipitous ledges, and the avalanches of snow. At from 12,000 to 13,000 feet, upon those peaks which shelter the masses of perpetual snow from which the sources of the Ganges take their rise, Captain Hodgson remarked a tree of the family of the Coniferæ, the branches of which, as thick as a man's leg, swept the ground. This tree, which he conceives to be a Pine, and which the Hindoos call Chandan, is perhaps the *Abies dumosa* of Don, which in that country holds the place which *Pinus Pumila* does on the higher parts of our mountains. Hodgson found the Chandan in lat. 31° to 32° , on the peak of Chour, and on the snowy mountains of Kounawur, which arise from Thibet. In this region, at a pass about 15,000 feet high, A. and P. Gerard observed, on the 2d of October, under a tent, the thermometer indicating, at noon, $+10^{\circ}$; at 4 o'clock it was zero, and the following morning at sunrise the temperature was $8^{\circ} 3'$. This cannot be considered cold, if we take into consideration the season, the height, and the latitude. The Vine, in a favourable exposure, produces delicious grapes at an elevation of from 8000 to 12,000 feet English. It must be observed that this is owing to the immediate efficacy of the solar radiation, which is the more powerful as the intervening stratum of air is less thick and more rarified. The last villages, the last cultivated fields, are at 13,000 feet: and this is the usual limit of the large Pine forests. At this elevation it is almost needless to say that the harvest pays very inadequately for the labour of cultivation: it consists of some of the Cerealia, Beet root, Millet, &c. A thousand feet higher up, some clumps of Fir, Birch, Gooseberry bushes, *Rhododendron*, *Vaccinium*, &c. may yet be seen. Then come the small woody or herbaceous flowering plants that are peculiar to the arctic regions, and the Mosses and Lichens attain to the borders of perpetual snow. The last expiring efforts of vegetation here are scarcely different from what is presented by the sum-

* Extracted from the *Géographie Botanique* of M. Mirbel, in the 14th volume of the *Mémoires du Muséum d'Histoire Naturelle*.

mits of the Andes, of Caucasus, the Carpathian and Swiss Alps, the Pyrenees, &c., nor from the productions of the extreme northern regions, and the antarctic districts that are divided from Patagonia by the Straits of Magellan. The larger natural floras, however decidedly pronounced their distinguishing characters may be, when, under the influence of a favourable climate, they display all their richness and variety of form, are insensibly reduced, by the effect of a gradual diminution of annual temperature, to a small number of families and of genera, whose specific types are, every where, if not the same, yet so much alike, that botanists themselves are often tempted to confound them.

4082. *The aspect of the southern boundary of Thibet* is wild and melancholy. High plains, bounded on all sides by chains of mountains, surmounted by enormous peaks that are covered with perpetual snow, often present the traveller with nothing but those saline incrustations and metallic substances which induce an almost absolute sterility. No large vegetable productions can be seen, only a few herbs and shrubs, whose stunted growth denotes the congenial nature of the soil. In some districts the land is rather better, and is either covered with spontaneous forests and verdure, or brought into cultivation by the hands of man. The winters are long and severe; for three whole months, the inhabitants are immured in their villages by the heavy snows; and the summers are scorching, the sides of the mountains reflecting back the sun's rays with extreme force. In valleys that are about 9800 feet high, such as those which intersect the Himalayah chain and the Mount of Cailas to the west, Rice, Wheat, Barley, Mulberries, and Opium Poppies are cultivated. There are also some extensive vineyards, rivalling, in the excellence, size, and flavour of their produce, the grapes of Cabulistan. Apricots, Walnuts, and Apple trees grow in the forests.

4083. *There are certainly* some remarkable discrepancies between the climate of the eastern and western parts of Thibet. The latter, of less elevation, and nearer the tropics, has, like the equatorial zone, its periods of rain and drought; and it is probable that the winter temperature is generally lower there than in Kounawur, though the cold be very severe.

4084. *The Alps of Thibet*, like those of Nepal and Boutan, produce Spruce, Fir, Juniper, Oak, Hazel, Alder, Willow, Birch, Elder, Horsechestnut, Ash, Ilex, Gooseberry, Raspberry, Rhododendron, Vaccinium, &c.

4085. *Himalayah and Thibet* bring us to the western frontier of China, where we meet with the Transition Zone. But what positive information can be given as to the vegetation of a country, which the unalterable manners, and, as it were, the very instinct, of its inhabitants shut out from the rest of the world, even more completely than could be effected by trackless seas, howling deserts, or mountains of greater elevation and asperity than the Alps of the Himalayah?

SUBSECT. 3. Zoology.

4086. *The native Zoology* presents a vast field for observation; and although many parts have been explored by Europeans, there still remains entire provinces which have never yet been visited by the naturalist. Our celebrated countryman, Pennant, brought together all the information which was then known; but the revolutions in nomenclature, which more enlarged views of natural science has since occasioned, and the important discoveries since made, have now rendered the "Indian Zoology" of little service to the modern naturalist. It is not a bare list of animals, with their scientific names, that is now wanted, but rather information on the geographic range and the natural economy of each, viewed in reference to the peculiarities of the countries they respectively inhabit. The publication of the voluminous materials, collected by General Hardwicke, during a long residence in British India, will materially illustrate these questions. In the mean time, the following brief notices on the chief peculiarities of Indian zoology will not be uninteresting to the general reader, as tending to illustrate our previous remarks on the distribution of Asiatic animals in general.

4087. *The Quadrupeds which appear to characterise* more particularly the regions of continental India are the following. They are arranged under those divisions of the peninsula where naturalists inform us they are chiefly found:—

1. Hindostan generally.

Genetta fasciata. Banded Genett.
Mus giganteus. Gigantic Rat.
Cerocebus radiatus. Radiated Monkey.
Papio apedia. Thumbless Baboon.
Papio niger. Black Baboon.
Rhinoceros indicus. Indian Rhinoceros.
Pteropus palliatus. Mottled Bat.
Ursus malayanus. Malay Bear.
Ursus labiatus. Thick-lipped Bear.
Mangusta Mungos. Indian Ichneumon.
Prionodon? albifrons. White fronted P.
Leo asiaticus. Swains. Asiatic Lion.
Felis Tigris. Royal Tiger.
Felis venatica. Maneless Hunting Leopard.
Cervus porcinus. Brown Stag.
Raphicerus acuticornis. Sharp-horned Antelope.

Antelope cervicapra. Common Antelope.
Raphicerus subulata. Awl-horned Antelope.
Gerbillus indicus. Indian Gerbil.
Hystrix fasciculata. Pencil-tailed Porcupine.
Hystrix macroura. Long-tailed Indian Porcupine.
Tetracerus Chicara (H. Smith). Chicara Antelope.
Tetracerus quadricornis. Four-horned Antelope.
Naemorhedus Duvacellii (H. Smith). Duvacell's Antelope.
Bos Bubalus. Common Buffalo.
Bos Gaurus. Gaur Buffalo.
Bos Gaveus. Gayal Buffalo.

2. Bengal.

Cerocebus cynosurus. The Malbrouck.
Nycticebus bengalensis. Slow Lemur.
Nyctinomus bengalensis. Bengal Bat.
Pteropus marginatus. Bordered Bat.
Genetta Bondar. Bondar Genett.
Viverra prehensilis. Prehensile Viverra.
Manis crassicaudata. Short-tailed Manis.
Cervus hippelaphus. Great Russa.
Cervus Aristotels. Black Stag.

3. Pondicherry.

Pteropus Leschenaultii. Spotted Bat.
Sorex indicus. Indian Shrew.
Lutra Nair. Pondicherry Otter.
Viverra Typus. Common Viverra.
Mus indicus. Indian Rat.
Mus Perchal. Perchal Rat.

4088. From the foregoing list, it would appear that the carnivorous quadrupeds, in regard to the number of species, are very small; and that this fact tends to invalidate the position, previously advanced, that the chief peculiarity of Asiatic India, when compared with America, appears to be the abundance of its ferocious quadrupeds. It must, however, be remembered, that numerical quantities must be taken into the account; for it is quite immaterial to the question, whether that abundance is occasioned by number or by species. To illustrate this farther, we may state, that during two years and a half spent in traversing the forests of Brazil, with the sole view of investigating its productions, we never once saw, or procured, a ferocious animal: so thinly do they appear scattered in that empire, or, at least, over such provinces as we visited. Now, the Tigers of India are well known to be so numerous, that it is impossible to enter the woods or jungles without seeing the print of their feet, or incurring the danger of their attack. Even the common people employed in agriculture are frequently alarmed by their appearance, and fall a prey to their ferocity, close to human habitations; neither can the abundance of these terrific animals be traced to a thinness of population, in respect to which the interior of Brazil is much more deficient. If the accounts of Oriental travellers are to be relied upon, the proportion of population between the two regions may be no greater than one to five. The "next neighbour" to a Brazilian of the interior frequently resides at a distance of thirty miles, and often of a two days' journey, particularly in the central province of Matto Grosso, or the "Great Wood."

4089. A brief notice of the following quadrupeds will be interesting or instructive: — the Rhinoceros, the Tiger, the Ichneumon, and the Antelope.

4090. The Indian one-horned Rhinoceros of the continent (fig. 613.) is distinct from that of the islands.

613

RHINOCEROS.

surprising degree. A few years ago, as Major Smith relates, a hunting party of Europeans, with their native attendants and elephants, met with a herd of seven; apparently led by one, much larger and stronger than the rest. This boldly charged the hunters. The leading elephants, instead of using their tusks as weapons, suddenly wheeled round, and received the thrust of the Rhinoceros's horn on the posteriors: the blow brought them and their riders to the ground. No sooner had they risen than it was repeated, and in this manner did the contest continue, until four of the seven were shot, when the rest retreated. This anecdote shows the tremendous power of the Rhinoceros, sufficient to overcome the active ferocity of the lion and the ponderous strength of the elephant: but this is only exerted in self-defence. The Rhinoceros derives all his food from the vegetable kingdom, and is quiet and peaceable if left to himself.

4091. The Bengal or Royal Tiger (fig. 614.) is the scourge of Asia and the Indian islands. Equal in size to the Lion, though

614

BENGAL TIGER.

generally inferior in strength, it wants not courage or ferocity to attack the king of beasts; a temerity which generally proves fatal. Ferocity cannot be more horridly developed than in the Tiger: it may, indeed, be termed a sanguivorous animal, for it will suck the blood of its victim previously to eating it, and will seize on any other that may come in sight; treating it in the same way. Its horrid avidity is such, that, while so engaged, it will almost bury its head and face in the reeking carcase of its prey. According to Marsden, the tigers in Sumatra are so abundant, that whole villages are sometimes depopulated by them. Yet, from a superstitious prejudice, it is with difficulty the natives

are prevailed upon, even by large rewards, to use means for their destruction, until revenge for some loss in their own family bursts the shackles of fanaticism under which they habitually sink.

4092. The Indian Ichneumon has some resemblance to the weasel, and is called by the natives *Mangouste*. Its total length, with the tail, is about two feet. It feeds entirely upon small animals, particularly birds, and, for its size, appears as voracious as the tiger. Although capable of being tamed, and even taking pleasure in the caresses of its master, it becomes extremely ferocious at sight of those little animals which constitute its prey. If within reach of a bird, it will spring forward with a rapidity which the eye cannot follow, seize its victim, break its head, and then devour it with the utmost voracity. This animal lives in holes, or in burrows, near habitations.

4093. *The four-horned Antelopes* (fig. 615.) (for there are probably two species) are peculiar to India. That which is named Chickara inhabits the forests and hilly tracts along the western provinces of Bengal, Bahar, and Orissa. It is a delicate-shaped, wild, and agile little creature, measuring about twenty inches and a half high from the shoulders. Its general colour is bright bay above, and whitish beneath. The form of the horns is simple; the largest pair being three inches long, and the others only three quarters of an inch.

FOUR HORNED ANTELOPE.

4094. *The Birds*, as we before observed, are numerous; but, however interesting to the scientific naturalist, there are few which demand, in this place, a particular description. The Peacock is the glory of Indian ornithology. The Jungle Cock (fig. 616.) is spread over the whole of this peninsula, but is replaced, in the islands, by other species: it is perhaps more beautiful than that domesticated

in Europe. The Oriental Pigeons vie with the Parrots in the brilliancy, yet softness, of their tints. There are no less than twenty-one species described as inhabiting the

JUNGLE COCK.

continents of India, and eleven more are peculiar to China, Molucca, and the islands. It is singular that this family, in point of species, is distributed in the two hemispheres in nearly equal proportions; twenty-four being described as American, and thirty-one as Asiatic: most of the latter have the ground colour of their plumage bright green, and principally belong to the genus *Ptilinopus Swains.* The gigantic Cranes have already been noticed, as well as the groups of such smaller birds as are sufficient to indicate the nature of the whole.

4095. *The Peacock* appears to have been introduced into Greece about the time of Alexander. It is without doubt the most superb bird in creation, although a familiar acquaintance with its form takes something from that admiration which it would otherwise excite. It is said to occur in the greatest profusion over the extensive plains of India, where it grows to a much larger size than with us. It appears, nevertheless, to be a shy bird; and domesticated individuals are sometimes of a pure white colour. It has been asserted, that the natives have the following very curious mode of catching these birds. A kind of banner is prepared, lighted by candles, and ornamented with painted figures of Peacocks. This is carried, during the night, and held up to such trees as are known to be their roosting-places. The birds, dazzled by the light, and deceived by the figures, repeatedly stretch out their necks, till they become entangled in a noose, fixed on the banner: the fowler then draws the cord, and secures his game.

4096. *The domesticated animals* may be briefly enumerated. The Asiatic Elephant, long confounded with that of Africa, may be at once recognised by its much smaller ears. Its services appear universal, and it is as essential to the Indian sportsman as a good horse is to an English fox-hunter. Domestication has so far counteracted the instinct of nature, that tame elephants are employed to decoy and catch their wild brethren. The Oxen are all of the humped breed; and the Buffalo is chiefly employed in agriculture. The Asiatic Sheep, in general, observes Major Smith, are partly of the same broad-tailed races as are found in Africa. There is, however, another breed in India, rather high on the legs, with moderate curved horns, and a collar of hair reaching to the shoulders; the tail is more hairy than the body, and reaches below the houghs: this variety is also found in China.

SECT. III. *Historical Geography.*

4097. *The name of India* has always been celebrated in the Western world, not only as a region abounding in rich products, but as an early seat and fountain of civilisation and philosophy. Whatever literary talent or application, however, the Hindoos might possess, none of it was turned to history; of which only some faint traces appear, amid the most extravagant fables. The first authentic notice is afforded by the invasion of Alexander; but that event, so celebrated in Greek history, was a mere partial inroad, producing no lasting effects. Yet the narratives of this expedition are precious, in so far as they show that the Hindoos were then precisely the same people as now; divided into castes, addicted to ascetic superstition, religious suicide, and abstruse philosophy. It does not appear that India was then the seat of any extensive empire; but it was divided among a number of smaller states. The expedition of Seleucus and the embassy of Megasthenes brought to light the existence of a great empire, of which the capital was Palibothra, on the Ganges; but the histories neither of the East nor of the West convey any details of the dynasty which reigned in that mighty metropolis. The interposition of the hostile monarchy of the Parthians cut off all communication between Rome and India, though one embassy from the latter country is said to have reached the court of Augustus.

4098. *The Mahometan conquest* by the Gaznevide dynasty formed the era at which a regular series of authentic history commences for India. The bold and rough population who inhabit the mountains of Afghanistan enabled Mahmoud the Great to unite all the west of India, with Khorassan and great part of Tartary, into one empire. His

dynasty, indeed, was subverted by that of Ghorí, which was followed by the long series of the Patan emperors. In 1398 they were vanquished by Timour; but it was more than a century afterwards that Baber founded the Mogul empire, which, extended under Akbar and Aurengzebe, displayed a power and splendour scarcely equalled by any monarchy even of Asia. Along with Afghanistan, it included nearly the whole of Hindostan, except some obscure corners and mountain districts; and even all these, more or less, owned its supremacy. The sway of Aurengzebe extended probably over 80,000,000 souls, while his treasure was estimated at 32,000,000*l.*; a sum equal in value to nearly triple the same amount in this quarter of the world.

4099. *The empire of Aurengzebe was soon undermined* by disputed succession and effeminate habits among his descendants; it was shaken by the rise of the Mahratta power, and in 1738 it was overthrown by the successful invasion of Nadir Shah. Nadir carried off all the treasures of Delhi, estimated by the lowest computation at 70,000,000*l.* sterling. Yet he returned to Persia, leaving to the Mogul all the territory west of the Indus; but from that moment the Mogul empire remained the mere shadow of a mighty name. All the tribes which, during its day of power, had taken refuge in the mountains, now descended to dispute its finest provinces; even private adventurers raised themselves into sovereigns. Among those tribes were pre-eminent the Mahrattas, who, from the Vindhya mountains, and the head of the western Ghauts, had already over-run the north of the Deccan, and now penetrated to the imperial provinces of Delhi and Agra; while, in the south, Hyder Ali erected the powerful kingdom of Mysore. A shadow of the Mogul name was preserved only by the policy of rival chiefs, endeavouring each to draw round himself the reverence which that name still commanded. A new power appeared in the field. Ahmed Shah, who had raised himself to the throne of Cabul, entered India, and completely defeated the Mahrattas in the great battle of Panniput. But while these chiefs contended thus fiercely for empire, a new power was rising, beneath which they were all destined to bend.

4100. *The European powers, in exploring through many dangers the passage by the Cape of Good Hope, had made it their first object to gain access to the splendid commerce of which India had always been the theatre.* To carry it on with security, and protect themselves against the violence and extortion of the native powers, fortified factories were perhaps indispensable. This step, once made, soon led to further acquisitions. The Portuguese, under Albuquerque, began a career of conquest, and founded, at Goa, a species of kingdom, which, however, fell soon into decay. The other nations long confined themselves to commercial pursuits. The vast commerce of England was protected, in Bengal by Fort William, in the Carnatic by Fort George, and in the West by Bombay, on the island of Salsette; while the French fixed the chief seat of their power at Pondicherry. The triumphant war of 1756 gave to England a decided pre-eminence in India over the other European powers. About the same time she began to acquire territorial possessions in Hindostan. Her first enterprises were on the side of the Carnatic; but there she was long held in check by the vigour and power of Hyder Ali. In Bengal her military career opened under the darkest auspices. Surajah Doulah, the soubah, invested Fort William with a large army, and, having forced it to surrender, threw the small garrison into that horrid dungeon, named the Black Hole of Calcutta, where the greater part of them perished. Soon after, however, Lord Clive arrived with a reinforcement, and, having taken the field, proved, in the battle of Plassy, how superior a small body of English were to the undisciplined numbers of the East. The soubah was deposed, put to death, and succeeded by his general, Meer Jaffier, who was destined to rule altogether as the vassal of the English East India Company. Not being found sufficiently compliant with the tenure, he was superseded, as were others in succession, until 1765, when the Company assumed to itself, under a nominal reference to the Mogul, the entire sovereignty of Bengal, Bahar, and Orissa. At the same time the victories gained over the Nabob of Oude extended the virtual dominion of Britain nearly to the Jumna. Meantime the Carnatic was a scene of the most bloody and obstinate struggles, especially with Hyder, by whom the British dominion was repeatedly brought to the brink of destruction. Being threatened, however, by the Mahrattas, and vigorously pressed by Sir Eyre Coote, that chieftain at length entered into a treaty of peace. His son, Tippoo, though brave, did not inherit the policy or experience of his father; and, after two obstinate wars, his career was terminated in 1799: Seringapatam was taken, himself killed, his kingdom appropriated by Britain in full sovereignty, or divided among her vassals. Such vast acquisitions, however, placed this country in open rivalry with the Mahrattas, whose power, now completely pre-eminent above that of the Mogul, extended over all the central provinces. In 1803, while the Marquess Wellesley was governor-general, this rivalry broke out into open war. The bold and comprehensive plan of the campaign formed by that statesman, seconded by the military talents of Lake and Sir Arthur Wellesley, who, on the field of Assaye, conspicuously displayed those talents which afterwards made him the first captain of the age, completely broke the power of that formidable confederacy. The Peishwa, its nominal head, was indeed replaced in his supremacy over the military chiefs who had assumed independent power; but an auxiliary force stationed at Poonah, his capital, ensured

the administration of every thing according to the mandate of the council at Calcutta. The British, after making a pecuniary provision for the last representative of the Mogul dynasty, took into their immediate sovereignty Agra and Delhi, the once proud capitals of India; and there remained only in the northern and western extremities a few states who were not their subjects, allies, or tributaries. In 1817, a new war was undertaken for the reduction of the Pindarees, a rude lawless tribe, harboured in the recesses of the Vindhya mountains. Though attempting only a flying and predatory warfare, they spread so wide, and caused such desolation, that the Marquess of Hastings conceived their suppression to be indispensable for the tranquillity of India. The opening of the campaign, however, gave occasion for the great Mahratta chief, Holkar, the Peishwa, and the Rajah of Berar to shake off the yoke, on which the contest assumed a very formidable character. The Peishwa was at length vanquished, and obliged to retire upon an annual stipend of 100,000*l.*; while the other two chiefs were reduced to a state of entire vassalage, and the British sway over Hindostan was more firmly established than at any former period. It was still further extended by an unsuccessful attempt at resistance made by the Rajah of Nepal. That prince, however, though humbled, retained his independence; and his territories, with those of the Seiks, in the west, are at present the only parts of India not placed completely under the control of the British.

SECT. IV. *Political Geography.*

4101. *India* has for many successive ages been the theatre of absolute empire, exercised by foreign military potentates. It presents, however, many peculiarities distinguishing it from a mere ordinary despotism. The basis of its population still consists of that remarkable native race who, during a subjection for thousands of years, have retained, quite unaltered, all the features of their original character. They preserve in full force that earliest form, a village constitution, their attachment to which seems only to have been rendered stronger by the absence of every other political right and distinction. The village, considered as a political association, includes all the surrounding territory from which the inhabitants draw their subsistence. Not only the public services, but all trades, with the exception of the simple one of cultivating the ground, are performed by individuals who hold them usually by hereditary succession, and who are paid with a certain portion of the land, and by fixed presents. The principal of these are the *potail*, or head man of the village; the police officers, with servants under them; an officer whose business it is to understand all local rights and boundaries, and to be the arbiter of disputes respecting land; the superintendent of watercourses; the brahmin; the astrologer; the village register; the smith, carpenter, poet, musician, dancing girl. So deep is the principle of this association, and so strong the feeling of the rights connected with it, that it has remained unaffected by all the storms of revolution which have passed over India. Even after the inhabitants of a village have been obliged to flee before the devastation of a successful invading army, they have never failed, on the return of peace, to seek their native spot, and have been allowed, without controversy, to resume their occupancy. "Infant potails," according to Sir John Malcolm, "the second and third in descent from the emigration, have in many cases been carried at the head of these parties. When they reached their villages, every wall of a house, every field, were taken possession of by the owner or cultivator, without dispute or litigation among themselves or government; and in a few days every thing was in progress, as if it had never been disturbed." Such is the strength of this principle of union, that a wise ruler, even the most arbitrary, in levying a revenue or demanding services of any kind, has found it the most expedient method to apply to the heads of the village, and delegate to them the task of collection and apportionment. In rural or hilly districts, the collection of the revenue was confided to a class of officers entitled *zemindars*, who, acquiring by degrees an hereditary tenure, and being merely obliged to pay a certain fixed rent, came to be viewed as proprietors burdened with a high land tax. Being intrusted at the same time to a great extent with the administration of justice and police, and having a force under them for that purpose, they became in a manner the feudal lords of the district. Under them, the immediate cultivators were the *ryots*, who, either by original right or long established usage, held the lands, so long as the rent was paid, in undisturbed tenure, which descended from father to son without alteration.

4102. *The classes now enumerated* belong all to the Hindoo population and, so long as they are permitted to move unmolested in this circle, they quietly behold all the high places occupied by any people, however strange or foreign, with whom rests the power of the sword. They have no idea of political rights or privileges, of a country or nation of their own and in whose glory and prosperity they are interested; they never converse on such subjects, and can scarcely be made to comprehend what they mean. Their only political bond is to a chief who possesses popular qualities, and attaches them by pay and promotion: to him they often manifest signal fidelity, but are strangers to every other public feeling. Despotism is not only established by long precedent, but is rooted in the very habits and minds

of the community. Such habits naturally predispose the people of a fertile region, bordered by poor and warlike tribes, to fall into a state of regular and constant subjection to a foreign yoke.

4103. *The power*, as we have seen, which for many centuries ruled over Hindostan, was *Mahometan*. The votaries of Islam, as usual, entered India sword in hand, announcing proscription and desolation against all who should profess a faith opposite to their own; but while by these unlawful instruments they had converted the whole west and centre of Asia, in India their religion never made the slightest impression. The Hindoos opposed to it a quiet and passive, but immovable resistance. The conquerors, finding in them such a fixed determination upon this point, while on every other they were the most submissive and peaceable subjects, allowed their own bigotry to be disarmed. With the exception of Aurengzebe and Tippoo, they have long left the votaries of Brahma in the unmolested possession of their faith, and of the various observances with which it is connected. The Mahometans have been reckoned at nearly 10,000,000, or about a tenth of the population of Hindostan; but in this number we suspect that those of the kingdom of Cabul have been included, and that it is only in the provinces on the western frontier that they enter largely into the mass of population. They do not appear to have employed themselves as cultivators, or in the fabrics of the country. They consisted almost solely of the troops maintained by the Great Mogul, and officers employed by him, who, with their families and posterity, swelled gradually into a numerous people. The residence of the Mogul was rather a great moving camp, than a fixed metropolitan city. Delhi, Agra, or any other places, which his abode caused to rank with the most splendid cities of the East, when deserted by his army and train, sunk into towns of secondary magnitude. The great lords who were once his courtiers, counsellors, and the commanders of the troops, were called *omrahs*, of whom there were four principal. They were supported, not by pay, but by certain portions of land assigned to them, of which they drew the revenues. The provinces were governed also in a military manner by *soubahs*, who, like other despotic viceroys, exercised within their own limits all the authority of the Mogul. In many cases, they came gradually to regard those territories as belonging to them by a sort of hereditary right; and, on the breaking up of the empire, openly erected themselves into independent rulers. The family of Hyder was Mahometan. That dynasty, however, and almost all the others, have been crushed, by the power either of Britain or by the Mahrattas; and there is now scarcely any other sway in India. The Mahometans have become a subject race.

4104. *In contemplating Hindostan as it now exists, the power of Britain* appears entirely predominant. This absolute sway of an island comparatively so small, over an empire of 100,000,000 inhabitants, situated nearly at its antipodes, and accessible only by so vast a circuit of ocean, presents one of the most remarkable phenomena in the history of the world. Yet the subjection is complete, and almost universally peaceable; and the presages of its short continuance, which some entertain, are perhaps chimerical. We have already observed that profoundly passive disposition which prevails among the great body of the nation, so long as no violence is done to their faith, and their ordinary habits are not interfered with. The number of Europeans by whom such vast dominions are held in subjection very little exceeds 30,000. But this number is multiplied by that peculiarity in the character of the Hindoo, which makes it easy to train him into an instrument for holding his own country in subjection. He has scarcely the idea of a country to fight for. "The Asiatic," says Mr. Fraser, "fights for pay and plunder; and whose bread he eats, his cause he will defend against friends, country, and family." Accordingly, the *sepoys* (Indian troops commanded by British officers, and trained after the European manner) are found nearly as efficient as troops entirely British; and, so long as nothing is done to shock their religion and prejudices, they are equally faithful. Their number amounts to upwards of 230,000 infantry and 26,000 cavalry. The purely European troops maintained by the Company do not exceed 8000, but a large body of the king's troops are always employed in India: these at present are about 20,000. The Company doubles the pay of all the king's troops employed within their territories. These forces are variously distributed throughout India; for, besides defending and holding in subjection the territories immediately under British sway, bodies of them are stationed at the capitals of the subsidiary princes, at once to secure and overawe them. The degree of vassalage in which the different states of India are held somewhat varies. The Nizam, or soubah of the Deccan, the king of Oude, the rajahs of Nagpoor, Mysore, Sattara, Travancore, and Cochin, with the representative of the house of Holkar, though they exercise, not without some interference, their internal administration, are entirely under the control of Britain. The Gwickwar in Guzerat, and the numerous petty Rajpoot principalities, are rather friendly allies under her protection. Scindia is still nominally quite independent; but his territories are so enclosed by those of the Company, that, in case of any general movement, he can scarcely act, unless under the dictation of the Company.

4105. *Amid the general conquest and subjugation of India by Britain*, the western pro-

vinces alone have never as yet come even into hostile collision with that power. The state with which it is in most immediate contact is that of the Seiks, or Sikhs. This remarkable people began their career as a religious sect, adopting a sort of combination of the Hindoo and Mahometan creeds. Their habits were originally mild, abstracted, and almost philosophic; but persecution, and the treacherous and cruel death inflicted on two of their chiefs, roused their fury, and converted them into a race of savage and desperate warriors. While the Mogul power, however, continued in its vigour, they could only avenge their wrongs by hasty and stolen ravages; after which they sought the recesses of the northern mountains. On the dissolution of the great empire, however, they showed themselves capable of resisting any of the native armies, and were only kept in check by the hardy troops of the king of Cabul. They possess nearly the whole territory of Lahore, or the Punjab, watered by the upper course of the five great rivers which convey to the Indus the waters of the Himalayah; they also possess the northern part of Delhi, as far as the Jumna. Their government forms a species of theocracy, under a body of chiefs uniting the heterogeneous characters of priests, warriors, and statesmen. Of these a grand national council is held at Amritsir, the sacred city of the Seiks, in which, after a number of peculiar religious ceremonies, the national affairs are taken into consideration, and a plan of operations suited to the emergency is formed. Disunion has prevailed among these chiefs, but they are now united under the almost absolute sway of Runjeet Sing, who has also conquered Cashmere and a great part of the kingdom of Cabul, including Peshawer, lately its capital. He has fixed his residence at Lahore, and maintains an army of eighty regiments of infantry equipped in the European manner, and disciplined by French officers, though they are led into the field by the hereditary chiefs or khans. The artillery and cavalry are also respectable, and he is supposed to have accumulated a large treasure.

4106. *Moultan*, composing the lower course of the five rivers, with all the territories along the Indus, including Sinde, its delta, are governed by chiefs formerly tributary to the king of Cabul; but at present subject to Runjeet Sing. This region is separated from Guzerat, and the other fine provinces of central Hindostan, by a vast tract of desert. Yielding, however, some coarse grain and pasture, it supports a certain population, and is occupied by a number of rude chieftains, or petty princes, called Rajpoots, who paid even to Aurengzebe only a slight form of submission. At present they are engaged in almost perpetual contests with each other; but no foreign power seems to interfere with them in the possession of these dreary wastes.

4107. *The following estimate* has been made, in a recent parliamentary paper, of the extent and population of the territories under the immediate administration of the Company: —

	Square miles.	Population.
Presidency of Bengal	220,312	69,710,071
Madras	141,923 $\frac{1}{4}$	13,508,535
Bombay	59,438 $\frac{1}{4}$	6,251,546
	421,673 $\frac{3}{4}$	89,470,152

There are, besides, 85,700 square miles in Bengal, and 5550 in Bombay, the population of which has not been ascertained; but, as they consist of rude districts situated on the Upper Nerbuddah and in the Concan, their population is probably not extensive; and British India will not much exceed 90,000,000. Mr. Hamilton has formed, apparently with some care, an estimate of the population of the subject and independent states. The following come under the first head: —

	Population.
The Nizam	10,000,000
The King of Oude	3,000,000
The Rajah of Nagpoor	3,000,000
of Mysore	3,000,000
of Sattara	1,500,000
The Gwickwar	2,000,000
Travancore and Cochin	1,000,000
Rajpoot and various minor principalities	16,500,000
	40,000,000

The states that still remain independent of Britain are thus estimated: —

Scindia	4,000,000
The Seiks	3,000,000
Nepal	2,000,000
Cashmere and other districts subject to the Seiks	1,000,000
Sinde	1,000,000
	11,000,000

4108. It is painful to reflect that the *sway of Britain*, which has extended so widely over Hindostan, was in the first instance decidedly injurious. The observation applies peculiarly to Bengal, which had previously attained a most flourishing state, under the beneficent administration of Aliverdi Khan. The military adventurers, by whom chiefly affairs were at first administered, aimed directly to fulfil the boundless expectations entertained by the Company from the possession of an empire so famed for wealth, and to return laden with riches to their native country. Every mode of arbitrary exaction and extortion was therefore practised. A larger revenue was raised from the country than it had paid to the Mogul in its greatest prosperity. During that dreadful famine in 1770, when a third of the inhabitants are supposed to have perished, and multitudes of the cultivators fled into other districts, the revenue was still forcibly maintained at its former standard by heavy surcharges on those who remained. Under this system, the finest country in the world was in danger of being rapidly reduced to a desert; and large tracts, formerly covered with waving harvests, were converted into jungle, the abode of wild beasts. The breaking up of the native authorities, without any effective substitute, gave a dreadful extension to the system of *decoity*; a species of robbery, unknown at least in the civilised kingdoms of Europe. It is carried on somewhat after the manner of the predatory tribes, who infest the neighbouring regions, on a great scale, and by persons who are not considered as disgraced by it, either in their own estimation or that of others. They exercise this propensity to plunder, not on their immediate neighbours, but in distant *forays*, in which they surprise villages during the night, and employ the most dreadful tortures to procure hidden treasure.

4109. *It is but justice to the Company to observe*, that they appear from the first to have cast an anxious eye on the distressed state of their Indian possessions. Several expedients were tried without success, till, in 1784, Lord Cornwallis went out with full powers, and the foundation was at length laid of an ameliorated system. The leading arrangements were: — A settlement of the landed property was made, first for ten years, but afterwards rendered perpetual; upon payment of which, the zemindars were invested with the absolute property of the lands, having under them the ryots, who, on payment of a fixed rent, were also to maintain their tenures. To secure this property against the encroachments of power, it was rendered unlawful for any European to possess land in India. At the same time, civil and criminal courts on the British model, and administered by British judges, were established; the former in every town, with an appeal to superior tribunals at the cities of Calcutta, Dacca, Patna, and Moorshedabad, and a final resort to a supreme tribunal in the capital. Criminal justice was to be administered by separate judges performing a circuit through the same cities.

4110. *Notwithstanding the excellent intentions with which this system was formed, and the good general principles on which it is founded, it has but imperfectly fulfilled the object of restoring the prosperity of British India.* Although the annual payments exacted as land revenue were no longer arbitrary, yet they were fixed too high; and, being enforced with the utmost rigour, and by sales of the property on which the arrear arose, they soon produced the impoverishment or ejection of almost the whole body of the former zemindars. The ryots, being too poor to purchase the forfeited lands, were only exposed under this system to new oppressions. The zemindary and village police, which had, though in a somewhat rough way, generally maintained the country in tranquillity and security, was found to be very disadvantageously supplanted by the system, in itself so excellent, of British jurisprudence. That system, administered by young judges, who came out with little study, and little view but of making a fortune, was found to exhibit faint traces of its native excellence. Even the best lawyers have found it a matter of extreme difficulty to judge Indians, — a people whose language, manners, and whole train of ideas are foreign and opposite to those of Europe. The natives, too, are wofully addicted to perjury, and have been greatly encouraged in it by the facility which this ignorance of their judges affords them of escaping detection. Hence the British tribunals are often completely at a stand in cases where the tact and experience of a native judge would at once have unravelled the truth. The consequence has been, that an arrear of civil cases has accumulated, amounting almost to an absolute denial of justice; while, in the criminal courts, it is often necessary, for want of evidence, to dismiss individuals, of whose guilt the most perfect conviction is entertained. Thus, after a long and profound internal peace, under a strong government, and an administration of justice intended to be strictly equitable, the country has recovered only very imperfectly from the state to which it had been reduced by the original system of spoliation. In fact, the exertions of the Company have of late been employed to restore the original system of police and society; and this object, though difficult, has been effected in some degree, and with favourable results.

4111. *The revenues of British India* amounted, in 1829–30, to 21,600,000*l.*; of which 13,800,000*l.* was from Bengal, 5,400,000*l.* from Madras, and 2,400,000*l.* from Bombay. The charges, however, including 2,000,000*l.* sterling of interest on debt, exceeded the revenue by 602,000*l.* Extensive reductions, however, have since been made; so that, in the estimates for 1830–1, a surplus of 868,000*l.* was contemplated.

SECT. V. *Productive Industry.*

4112. *India* has always been, in a peculiar manner, celebrated for its *fertility*, and for its profusion of magnificent and valuable products. In fact, the tropical countries, wherever water abounds, must surpass the regions under the temperate zone in this respect, were it only from the circumstance of producing more than one crop in the year. The large and copious streams of Hindostan maintain generally throughout that country a perennial abundance. This character, however, is by no means universal. All the west of central India, except where it is watered by the Indus and its tributaries, consists of sand, in which the traveller sinks knee-deep. Sand forms even the basis of all the flat country of Bengal; though inundation and culture have covered it with a thin surface of productive clay. A great part also of the hilly districts, being over-run with that species of rank underwood called jungle, is unfit for any useful product. Although the Hindoos, too, have ever been an agricultural people, and remarkable for their industry, nothing can be more imperfect than the instruments, or the skill, with which they conduct that important art. The cultivators, for security under an imperfect police, or from mere custom, live in large villages, having each a small spot, on the tillage of which they occupy themselves, in conjunction with the labours of the loom and with other employments. Holding their lands by no tenure except that of usage, they never think of expending capital in their improvement, and could not, probably, with safety, show themselves possessed of property. Their plough, in comparison with ours, does not deserve the name. Rudely constructed, at the cost of less than half a crown, it cannot penetrate beyond two or three inches deep, and has no contrivance for turning over the soil. It is drawn, not by horses, but by oxen and buffaloes, sometimes yoked together. The ground, after being scratched in several directions by this instrument, followed by the rough branch of a tree as a substitute for the harrow, is considered fit for receiving the seed. Manure is employed only in some rare cases, and consists merely of ashes and decayed vegetables. Cow-dung is not only scarce, but is accounted holy: it is also employed as fuel, and is even plastered on the walls by way of ornament. There is no idea of any rotation of crops, except the succession to be raised within the year; and this is conducted on a principle of raising the utmost possible quantity, until the ground is completely exhausted. It is then abandoned to a state not of fallow, but of *lay*, and the cattle are pastured upon it, until by continued rest it has regained its fertility. This rude system of husbandry resembles that which was practised in Europe during the early ages. It is not supposed that even in Bengal more than one acre in three is under actual tillage. The cultivators are poor in the extreme, their annual rents on an average not exceeding four pounds; and, instead of possessing any capital, they are usually sunk in debt.

4113. *Notwithstanding all these deficiencies*, nature is bountiful, and the products of India are copious. Rice is the article upon which the whole region rests its main dependence; it is raised on every spot where irrigation can be procured. The periods of sowing and reaping vary, and produce a corresponding variety in the quality. Only one crop is raised in the year; but with another of millet or pulse on the same field. In some of the western Mahratta districts, it is necessary to substitute *d'hourra*, the arid and coarse grain of Nubia. Wheat and barley are fitted only for those tracts which, from their more elevated site, approximate to the temperate climates.

4114. *Hindostan has other highly valuable products.* The most important, perhaps, is cotton, the material of the great national manufacture. It is chiefly raised in the inland and somewhat dry tracts of Agra and the Deccan. Mirzapour, in the province of Agra, is the general market for cotton, the price of which varies from 1*l.* 13*s.* to 2*l.* 4*s.* 6*d.* per cwt. It is not equal in quality to the American. Silk is also a very ancient staple of India, particularly of Bengal, though not to the same extent as in China; and the Italian silk is now decidedly superior to both. There is also a wild species brought in from the eastern wooded tracts of Assam and Silhet, which is useful from its cheapness. The continent of India does not produce those more delicate spices which distinguish the islands; but pepper, so extensively used in Europe, grows in the greatest perfection and abundance on the high wooded mountains that rise above the coast of Malabar. Sugar was plentiful in Hindostan before it was known in Europe. The interior of Bengal might yield it to any extent, and at much less expense than that raised in the West Indies; but, from the defective mode of preparation, it is of very inferior quality, and is in that form called *clayed*, which is not suited to the European taste. *Opium*, that favourite though pernicious luxury of the East, is the staple of the interior province of Bahar, and is raised of still superior quality in Malwa. It is a precarious crop; and the British rendered it still worse by monopolising, and then using compulsory measures to make the farmers grow it; but by recent regulations these restrictions have been in a great measure removed. *Indigo* has been an early product of India, of which it bears the name: but that of Mexico obtained the preference in Europe, until within the last twenty years, when, by the vigorous exertions of some active individuals, it has been so much improved, that it is imported now to a large annual amount. It is cultivated by the ryots upon advances made by the British; but the cleaning and preparing

it for use are entirely performed by Europeans, and with machinery of their erection. The average produce of Bengal and Oude, the latter of which is of considerably inferior quality, is estimated at 9,000,000 lbs. *Coffee* has become an article of considerable importance; and in the last year (1831), 3,000,000 lbs. were imported into Britain from Malabar. *Saltpetre* is produced more abundantly in Bahar than in any other known country. Its formation takes place chiefly during the hot winds, and seems to be connected with that phenomenon.

4115. *Besides these luxuries* destined for exportation, there are *others*, extensively consumed in the interior. The nut of the areca, combined with the leaf of the betel, is one universally used in India, which has never found its way into Europe. The customs of the country cause a vast consumption of vegetable oils, which are supplied from the sesamum, also from lint, mustard seed, and the cocoa nut. Woods of various kinds grow luxuriantly on the lower declivities of the Indian hills. The canes, composing the thick jungle or underwood which abounds in marshy grounds, are not only used as in Europe, but are much employed in building. The teak has been found unrivalled for ship-building; but though it flourishes on the hills of Malabar, it does not attain such perfection there as in Java and the Eastern peninsula. Malabar furnishes also a large supply of sandal-wood, of the species called red-wood, as well as others used for dyeing, or for ornamental furniture.

4116. *The following estimate* of the produce of the British Bengal territory, including Benares, Bahar, and part of Orissa, was made, seemingly with great diligence and attention, by Colonel Colebrooke. To appreciate the extreme cheapness of Indian produce, we must observe, that the maund consists of eighty lbs., or within a trifle of an English bushel.

	£
Rice, wheat, and barley, 150,000,000 maunds at 1s. 6d. per maund	- 11,300,000
Millet, 60,000,000 maunds, at 1s. per maund	- 3,000,000
Pulse, 90,000,000 maunds, at 1s. 3d. per maund	- 5,625,000
Seeds	- 4,038,000
Sugar, tobacco, cotton, opium, and other articles	- 9,000,000
	£32,913,000

The space on which these products are raised is estimated to contain 160,000 square miles, and 30,000,000 souls. Hindostan, taken altogether, may be quadruple as to extent and population, but not quite so as to wealth. We may, therefore, conjecture its entire produce at about 100,000,000*l.*; but it must be remarked, that the same articles would be considered very cheap in England at six times the prices above stated.

4117. *It is not, however, for the natural products alone*, but, in an especial degree, for *manufactures*, that the commerce of India has been so much prized in the Western world. Cotton, her native material, though not possessing any peculiar original beauty, has, by the skill of her artisans, been worked up into forms of dress the most elegant that human industry has ever produced. That of muslins, ingenious and delicate beyond all others, is appropriate and peculiar to Bengal, in whose eastern district of Dacca it is fabricated in a perfection elsewhere unrivalled. Though especially adapted, as it were, for the climate of India, so general has been its attraction, that this delicate fabric has become the staple of Scotland and the north of England. There, by the employment of machinery and the division of labour, it is produced much cheaper, and, in some instances, even of finer texture; but the muslin of India, richer, softer, and more durable, still maintains its reputation. The same superiority is preserved by the calicoes, ginghams, and chintzes, which form the staple manufactures of Coromandel, and particularly of the Circars. Though nearly driven out of the European market by cheap and successful imitations, they are still preferred over the East, where the curious consider themselves able to distinguish by the touch, and even by the smell, these genuine products of the Indian loom. The central and western provinces are not so eminent in manufactures, with the exception of Guzerat, where, especially in Surat and its neighbourhood, they are cheap, good, and of great variety, yet do not attain the same high excellence as in Eastern India.

4118. *Silk*, though holding only a secondary place as an Indian manufacture, is still ancient and considerable. Its main seats are the great cities of Moorshedabad and Benares, with their neighbouring districts: at Surat, also, the quantity manufactured is considerable. Taffetas, brocades, and embroidered gauzes, are its prevailing forms.

4119. *Woollen manufactures* are not suited to the climate of that tropical plain of which Hindostan chiefly consists. In the upper regions, however, which form the slope of the Himalayah, they are made in large quantities, though coarse, and for home consumption. Cashmere alone collects that fine wool, peculiar to the goats which feed on the table-land of Thibet; and from this material are manufactured those exquisitely beautiful shawls which Europe has striven to rival, but unsuccessfully, except in cheapness. The shawl manufacture of Cashmere has suffered peculiarly by the revolutions of that country; and the looms employed in it have been reduced from 40,000 to 16,000.

4120. *The commerce* of India has always possessed, in the eyes of Europeans, a dazzling and indeed illusive splendour, derived from its remoteness, and the brilliant character of

some of its articles. It possesses by no means the magnitude or importance which these circumstances have led men to ascribe to it. Besides, though, both in ancient and modern times, it has afforded a grand impulse to trade and enterprise, the Indians have never been a trading nation. They never carried any of their own precious products into other countries; but, disdainfully, as it were, granted them to those who came to seek them from the farthest extremities of the globe. With equal disdain, they rejected almost every article which was offered in exchange, and would accept nothing but treasure in its most solid and palpable form. The course of Indian trade was hence a constant theme of regret to those politicians who considered the benefit of this intercourse as dependent solely on what was called a favourable balance, and who viewed India as a gulf in which all the treasures of the West were buried. Modern enquiries have fully shown that this by no means prevented the trade with India from being highly beneficial; though the limited export, no doubt, rendered it less so than it otherwise would have been. Yet the importance of Indian commerce has always been, and is, grossly exaggerated.

4121. *The mining operations* of India are confined to one object, of so brilliant a character, however, as to throw a lustre on this and on all the Oriental regions. It produces the finest diamonds in the world; for those of Brazil, though of greater size, are inferior in hardness and brilliancy. The Indian diamonds occur chiefly in a high and rugged tract, inhabited by tribes almost independent, and extending from Golconda across the interior of Orissa. The principal mines are described by Tavernier as situated at Raolconda, Color, and Sumbulpoor. In the first of these places, the diamonds occur in narrow veins traversing the rock, and mixed with the sand and earth which fill their cavities; at Color they are found in the soil of a plain which stretches along the foot of some high mountains; while at Sumbulpoor they are mixed with the sand of the river Gouel, which falls into the Mahanuddy. The diamonds at this last place are exquisitely fine, but small when compared with those at Color, which yielded to Shah Jehan the famous stone, weighing upwards of 700 carats. Tavernier found at this mine alone 60,000 persons employed; but the importance of the working appears to have since diminished, either from the exhaustion of the mines, or the diminution of the demand among the native princes. The sands of the rivers of this tract yield also some gold dust, but not in sufficient quantity to become a national object. The diamonds of Pauna, in the district of Bundelcund, are celebrated, though not of such fine quality as those already described. India produces some iron, lead, and tin, though not in sufficient quantities for home consumption. Zinc is in particular abundance; and the same may in some degree be said of these products of calcareous countries, marble, sal-gem, alabaster, common salt both in rocks and plains covered with this mineral; but the great masses of rock salt are to the west of the Indus. Saltpetre has been already noticed.

4122. *The mode of conducting British commerce* with India has always, till very recently, been by means of exclusive companies; and the only competition was between these rival associations. About the middle of the seventeenth century, they were combined into "the United Company of Merchants trading to the East Indies;" by whom, from that time, all the concerns of government and trade were administered. Between 1770 and 1784, the Company were obliged to yield a great share of their political power, which is now jointly exercised by the Board of Control. But no material breach was made in their exclusive privileges as traders till 1813, when the intercourse with Hindostan was thrown generally open to British subjects, with only some restrictions as to the tonnage of the vessels and the ports from which they were to proceed; and even these have been in a great measure removed. Under the liberty thus granted, the private trade has increased astonishingly, and has almost driven that of the Company out of the field. In 1829, the exports by the Company amounted to 434,000*l.*, by private traders to 3,665,000*l.* The imports by the Company were 1,593,000*l.*, by private traders, 4,624,000*l.* The imports into Britain were, in 1829, chiefly cotton piece goods, 289,000 pieces; cotton, 24,920,000 lbs.; indigo, 5,980,000 lbs.; pepper, 2,000,000 lbs.; raw silk, 2,126,000 lbs.; silk manufactures, 96,000 pieces bandanas; 17,000 crape shawls; 4500 pieces taffetas; sugar, 497,000 cwts.; turmeric, 1,100,000 lbs.; rice, 192,000 cwts. and 62,000 bushels; borax, 153,000 lbs. The chief exports from Britain were, cotton manufactures, value 1,450,000*l.*; cotton twist, 203,000*l.*; woollens, 372,000*l.*; linens, 30,000*l.*; copper, 403,000*l.*; iron, 195,000*l.*; spelter, 46,000*l.*; machinery, 68,000*l.*; stationery, 80,000*l.*; books, 34,000*l.*; leather, and saddlery, 33,000*l.*; medicines, 22,000*l.*; guns and pistols, 51,000*l.*; lead and shot, 20,000*l.*; wines, 162,000*l.*; beer, 95,000*l.*; carriages, 19,000*l.*; provisions, 39,000*l.*

SECT. VI. *Civil and Social State.*

4123. In surveying the political state of Hindostan, an estimate has already been given of *its population*, by which it amounts to about 140,000,000. Of this vast multitude, nine tenths are still believed to consist of that native original race who, though subject to a foreign power during so many ages, have remained always unmixed, and have retained

unaltered their ancient habits and institutions. This people, who have attained a considerable degree of civilisation, though in a form quite different from the European nations, present a highly interesting subject of contemplation.

4124. *In their external form, the Hindoos*, though, by the action of the climate, rendered as black as the negro, have otherwise nothing of the negro aspect. Neither do they exhibit the broad and flat visage, nor the other distinctive marks, of the Mongol race who people China and Eastern Tartary. Their form belongs to that variety termed, by Blumenbach, the Caucasian, and which includes also the people of Europe. Even from them they are distinguished by a peculiar delicacy and exility of shape, suggesting the idea of a refined and even effeminate people. The races, however, bred to war, who inhabit the mountains and the western tracts, are of a bodily constitution much more hardy and athletic.

4125. *The manners of the Hindoos*, still more than their persons, bespeak peculiar refinement. They are described as in a remarkable degree polished, graceful, and engaging; and, in the whole intercourse of society, a politeness and urbanity reigns, much beyond what is observed in European circles. The impression made by them upon a stranger is that of a benevolent and amiable people. Those gentlemen, however, who have of late communicated the results of more intimate inspection, present a much less favourable picture. That outward politeness, it is said, soon resolves itself into the smooth and interested servility which men acquire in courts, and under despotic governments, by habitual intercourse with those on whom they are dependent. It is entirely prompted, therefore, by self-interest, which forms the basis of the Hindoo character, and is cherished without regard to any feelings of honour and dignity. These are entirely broken down by the influence of that despotism which, according to Mr. Grant, "is not only the principle of the government of Hindostan, but an original, irreversible, and fundamental principle in the very frame of society." In such a government, where men are excluded from the pursuits of ambition, and checked at least in any public or lively amusements, selfishness turns almost entirely into avarice; and this is described as quite the ruling passion in the breast of the Hindoo. It appears to be indulged with an almost total disregard of the principles of honour or honesty; the grossest breaches of which are so common, as to cause no surprise, and scarcely any indignation, even in those who suffer by them. In the same light do they regard that deliberate and systematic violation of truth, which seems rooted in the Indian character. "It is the business of all," says Sir John Shore, "from the ryot to the dewan, to conceal and deceive; the simplest matters of fact are designedly covered with a veil which no human understanding can penetrate." This extends even to a form of guilt, from which the religious, or rather the superstitious, habits of the nation might have been expected to secure them. Perjury, the most deliberate and complete, marks every deposition made before an Indian court of justice. What involves the tribunals in particular perplexity is, that even those who mean well, and have truth to tell or to attest, think not that they do enough, unless they enforce it by false additional particulars; and it would thus be impossible for courts of justice to carry on their investigations, if they should reject evidence because it was combined with the most palpable falsehoods and perjuries. On a close inspection, too, much disappears of the mildness and quietude which are so conspicuous on the surface of the Hindoo character. Deadly feuds reign in the interior of villages; and, between those who have no motive to be on ceremony or on terms of courtesy with each other, violent wordy altercations often take place, seldom, however, proceeding to blows. In particular, the already mentioned prevalence of *decoity*, and the dreadful cruelties with which it is accompanied, go far to strip the Hindoo character of its fame for gentleness. Similar habits of violence are general among the predatory tribes of the West: but these indeed may be considered as differing in almost every point from the proper Hindoo character.

4126. *After all, the Hindoo certainly possesses some good qualities*; and, perhaps, the late very unfavourable pictures are drawn chiefly from the populace of great cities, and from men otherwise placed in situations trying to human virtue. It is admitted that, in fidelity to a master or chief from whom they have received treatment at all kind, they are surpassed, and indeed equalled, by very few nations. Their religion enjoins, and it is admitted that they perform, very remarkable acts of beneficence; and to assert that these proceed merely from a mercenary view of purchasing heaven, would be to judge with rather a scanty measure of charity. The habits of Hindoo life are pre-eminently domestic. Respect for old age is carried to a great height; and, when parents are no longer capable of labour, they are supported by their children, and, never allowed to become a burden on the public. Marriage is held as a perfectly indispensable part of life, without which a man would not be considered as possessing a regular place in society, or as qualified for exercising any important function. His marriage, and his marriage festival, are regarded as the most critical and splendid eras in the history of a Hindoo. Yet the wife, when obtained, is the object of very slight respect or regard. She is considered wholly unfit to be the companion of her husband, or even to be spoken to; and indeed care is taken to render her so. It is deemed disgraceful for her ever to open a book, to be able even to read a syllable, or to know any thing of what is passing in the world. She is regarded merely as a sort of privileged slave, created only to

obey and reverence her husband, and bound to view him with the most reverential awe. She is generally, however, faithful to him; and her attachment is manifested in an extraordinary and cruelly superstitious manner, by the sacrifice of herself on his funeral pile. Although a variety of motives may co-operate, this sacrifice would scarcely have become so prevalent, had not the principle of conjugal attachment been generally strong in the nation. Polygamy does not widely prevail; and dissolute manners, though strangely combined in many instances with religious observances, do not seem to be otherwise so general as in most parts of Europe.

4127. *The religion of India*, such as it is, reigns with unrivalled sway, and forms the basis of all its laws and institutions. It is not merely the object of internal meditation or occasional observance, but the guide in all the actions, outward and inward, small and great, of human life. This, however, which, in an enlightened and rational sense, might be considered as marking a peculiar excellence, is combined, in the vulgar at least, with habits of gross ignorance and mean superstition. Yet the Hindoo system fails not to comprise some very lofty elements; but these, being chiefly confined to the sacred books, which are inaccessible to the vulgar, have little influence on the general ideas of the nation.

4128. *The Hindoo mythology* is a system so vast and multifarious, that to introduce even a sketch would, within our limits, be scarcely possible. It is founded on the grand and philosophical idea of an immense all-pervading mind, from which the universe derived its existence. To this Nature, which is called the Bramh, or Brimh, they ascribe the most exalted attributes of power, wisdom, and beneficence. This being, however, is not represented as the active ruler of the universe, but as fixed in sublime and perpetual repose. He did not even, strictly speaking, create finite natures, but emitted them, as it were, out of his own substance, into which those which are most perfect will again be absorbed. Thus sprung the Hindoo triad, Brahma, Vishnu, and Siva, the supreme objects of popular worship. Brahma, though the highest in dignity, and manifesting even the qualities of the source from which he emanates, is comparatively little regarded, has no temples raised, and no national worship paid to him. Vishnu is the most active member of the triad. His nine fulfilled incarnations, and his tenth expected one, are prominent epochs in Hindoo mythology. On these occasions he appeared sometimes as a man, sometimes as a boar, a lion, or a tortoise, to deliver oracles, to destroy giants, and deliver the earth from the evils that oppressed it. In two of them he appeared as Rama and as Krishna, names which have almost superseded his own; and under the last appellation, by his extravagant amorous adventures, he has afforded ample theme to the luxuriant fancy of the Hindoo poets. As Vishnu is called the preserver and saviour, so Siva bears the title of the destroyer, and in that character has a numerous class of peculiar worshippers. He is usually represented under a form calculated to inspire terror, of gigantic size, naked, riding on a bull, his eyes inflamed, and serpents hanging from his ears like jewels. Wars with the gods and extermination of giants form the leading events of his history, which, as well as his worship, comprises some peculiarly indecent adventures and observances.

4129. *Among inferior deities*, the first place is held by Indra, bearing the lofty title of "king of heaven." This high place is maintained only by perpetual contests with the Asuras and Raksasas, the giants and Titans of India. He is even liable to be ejected by Bramins skilled in mighty magic, or by a king who can sacrifice an hundred horses that have never felt the rein. Other objects of worship are Kartikeya, god of war; Surya, the sun; Pavana, the god of the winds; Varuna, of the waters; Yama, the holy king who judges the dead, — a green man in red garments, and of terrible aspect, who keeps his court in the deepest mountain recesses, and at the hour of death extorts shrieks of terror from the guilty Hindoo. Juggernaut, or Juggannatha, considered an earthly deity, is distinguished by crowded pilgrimages, and by the frightful character of the worship paid to him. The rivers of India are also accounted divinities, particularly the Ganges, which is supposed to descend from heaven, and the affusion of its waters to purify from all sin. That the lowest forms of superstition may not be wanting, the worship of animals is extremely prevalent. The cow, above all, is held in deep and general reverence, and by many families one is even kept for the mere purpose of worshipping it. Next ranks the monkey, whose exploits are largely celebrated in the sacred books. It is considered a pious disposal of money to expend large sums on the marriage of monkeys.

4130. *The religious observances* of the Hindoos do not tend to give a higher idea of their wisdom than the creed on which they are founded. India is covered with temples, but those recently erected display nothing of that art, or even of that magnitude, which astonish us in those of Egypt and Greece. A temple may be built for twenty pounds; and the largest does not cost more than one hundred, or contain above three apartments. The rich seek to distinguish themselves by planting a number together: one pious lady has covered a plain near Burdwan with no fewer than 108 temples. Every temple must have its image, made of gold or silver, or, in default of these, of iron, brass, lead, or tin, sometimes even only of clay and pottery. The deity is manufactured by the workers in these metals and materials, and without the display of any skill in the art of sculpture: after its completion, the

Brahmins, by sundry ceremonies and invocations, are supposed to infuse the spiritual character. The person who builds the temple makes a grant for the support of its servants, among whom, besides Brahmins, it is necessary, in many parts of India, that there should be a certain number of courtesans; a truly singular instance of depravity in a people among whom female virtue is otherwise respected. The religious festivals are often prolonged for several days, with music, dancing, revelry, and various excesses which are proscribed by Hindoo manners on all other occasions. The rage for pilgrimage is universal, and is in itself, indeed, rather the most venial form of superstition, since it affords considerable opportunities both of information and commerce. The great periodical festivals at Hurdwar and Juggernaut attract millions, but are often accompanied with considerable sacrifice of human life. The bloody scenes at Juggernaut are well known: in these the frantic victims of superstition throw themselves under the wheels of the car (*fig. 617.*) in which that idol is

617

INDIAN CAR.

drawn furiously along, and fondly imagine that they thus secure a happy futurity. Another mode of religious suicide is by drowning in holy waters, particularly those of the Ganges, and at the island of Sagur. Parents sacrifice their children to the Ganges, or to any power whom they wish to propitiate; but this savage practice was prohibited by the Marquess Wellesley, and his order has been obeyed without resistance or murmur. It is not known from what motive a race of Rajpoots, in the west, have been induced to immolate all their female children. The number of these victims has been estimated at nearly 20,000; and the effects of the benevolent exertions of Colonel Walker for the suppression of this horrid practice, which were, at least in a great measure, successful, have not been permanent. Religious feeling, however, certainly enters into that fatal sacrifice by which the Indian widows are induced, and sometimes even compelled, to sacrifice themselves on the funeral pile of their husbands. This practice also was, in 1829, prohibited by a proclamation of Lord William Bentinck; a measure applauded by all the enlightened Hindoos, though it has

excited considerable discontent among the bigoted adherents of the ancient superstition.

4131. *The various forms of penance and self-infliction* form another mode of propitiating the favour of the Deity, and of obtaining with the vulgar the character of sanctity. These, always more or less prevalent among superstitious nations, are carried by the Hindoos to an extent elsewhere unparalleled. The Indian Yogues, or fakery, bury themselves in the depth of woods, allow their hair and their nails to grow, and their persons to be covered with filth, till they almost cease to present any vestige of humanity. Others remain for years fixed in one painful position, with the arm raised above the head, till the limbs become shrivelled or distorted. Instances have been given of persons who buried themselves under ground, leaving only a narrow tube by which they might breathe, and by which food might be introduced. A long course of such austerities is imagined to invest them not only with the highest character of sanctity, but even with power over the invisible world; and stories are related of mortals who have thus ejected potent deities from their place in the sky. A more obvious advantage is derived from the admiration of the multitude, who lavish not only homage but gifts on these uncouth devotees: and, as a certain period is supposed to complete the merit of the penance, they obtain time to enjoy its fruits, and often abandon themselves to every species of licentious indulgence.

4132. *The ideas of a future state* present also a strong and peculiar character under the Hindoo mythology. The human mind being considered an emanation from the Bramh, or supreme mind, they have adopted, to account for its pre-existence, the doctrine of the metempsychosis, or transmigration of souls, which is diffused over the whole East. Under this system, the souls of all animals are supposed to be those of men thus degraded, in punishment of their sins, but capable, after many ages, of regaining their pristine condition. In a cow, or a dog, they recognise, perhaps, a deceased friend or ancestor; and are thus led to treat them with a tenderness characteristic of the nation. This weakness they often carry to a ridiculous height, keeping hospitals for aged and even noxious creatures. Their creeds afford also, for the reward of the good, a variety of heavens, glittering with gold and precious stones, watered by crystal streams, and affording in abundance pleasures not always of the purest nature. The places of future punishment are in like manner multiplied, and filled with various species of torture; such as being burnt with hot irons, dragged through thorns, bitten by snakes, or thrown into vessels of liquid fire. The deeds, according to which these rewards or punishments are awarded, compose the moral code of the Hindoo. As it includes all the elementary principles of human duty, it has, no doubt, to a great extent, a salutary influence. Too great a proportion, however, of the actions to which merit is

attached, consists merely of outward idle ceremonies and absurd penances; and, in particular, the bestowing of gifts upon Brahmins, is a duty diligently inculcated by these reverend instructors.

4133. Religion has evidently been the main agent in causing that *distribution into castes* which forms the most prominent feature in Hindoo society. In all half-civilised communities, aristocratic distinctions are carried to an extreme height; but nowhere is the distinction between man and man rendered so broad and so monstrous as by this institution. In Egypt, and other ancient countries, a similar distinction appears to have existed, but was never so strong nor so permanent. A greater variety are enumerated by the Greek writers, as existing in their time among the Hindoos; but at present there appear to be only four prominent castes: the Brahmins, or priests; Cshatryas, or military class; the Vaisyas, or merchants; and the Sudras, or labourers. The functions and station of all these are fixed by their birth in the most decided manner.

4134. *The Brahmins* hold, beyond all comparison, the first place in point of dignity, and are regarded by the other classes with profound and spontaneous veneration. Yet no established provision is made by the public for supplying them with even the means of subsistence. Their ordinary dependence is upon alms; and to this mode of support they have given such a lustre, that over all India he who receives alms is considered as ranking higher than he who bestows them. This situation, at once powerful and dependent, is not favourable to the character of the Brahmins, who are led to employ their influence over a superstitious people entirely to the furtherance of their private views. The bestowal of copious gifts upon a Brahmin, and his consequent benediction, are represented as effacing every sin, and securing the most ample blessings. His curse is the forerunner of the most dreadful evils: it has even been represented as sufficient to strike its victim dead on the spot. At marriages, funerals, and on other great festal occasions, the rich Hindoos strive to distinguish themselves by large donations to Brahmins, of cloth, cows, rice, gold, and whatever is esteemed most valuable. Their influence is augmented by the use of *mantras*, or mighty words, deemed to have power even over invisible creatures, as well as by the discernment of the lucky and unlucky times and modes for doing all things. A prince or great man thus reckons it indispensable to keep near him some eminent Brahmins to be his guides in all the actions and emergencies of life.

4135. *The Cshatryas*, though inferior to the Brahmins, rank high in public estimation. The name signifies "sons of kings," and implies a boast of their descent from the ancient Rajahs. In their persons, they are handsome, tall, and athletic; but they are generally destitute of principle; and many of them practise the trade of robbery on a great scale.

4136. *The Vuisyas*, or mercantile class, are numerous in the cities, particularly of the coast, where they bear the title of Banians. Though their character is often disgraced by deceit and low cunning, some of them maintain a high character for mercantile talent and probity, and accumulate immense fortunes. In the interior their situation is more equivocal; they are found acting in various capacities, and many even serve as mercenaries in the Mahratta armies, or in the British service.

4137. *The Sudras* include the ryots, or cultivators of the ground, and also most of those engaged in handicraft trades. Though generally ranked below the Vaisyas, they do not altogether admit their inferiority: many of them acquire considerable wealth, and maintain a respectable place in society. There are, moreover, a number of small detached classes formed by the mixture of the four primary ones, and called the *Burrensunker*, by whom most of the handicraft trades are exercised.

4138. *A class of outcast beings* yet remains, whom Hindoo society excludes, and to whom it denies the most common rights of humanity. These consist of those persons who, from a neglect or violation of any of those minute observances which are necessary to preserve caste, have been expelled from any of the four classes above mentioned. From that moment the individual is deserted by his nearest relations, is excluded from all the charities and social connections of life; he forfeits even his property, and is commonly forced to flee into distant exile. The Pariahs in the south form a class of hereditary outcasts. No human beings exist in a more lost and deplorable state. It is contamination to enter their house, or eat any victuals prepared by Pariahs; nay, some consider themselves polluted by their very touch. They are confined in the towns to separate quarters, and employed in the rudest and most disgusting labour. In this degraded condition, it is but too natural that they should lose all sense of character, and, by filth, intoxication, and other excesses, justify, in some degree, the contempt in which they are held.

4139. This strictness and uniformity of the Indian system does not wholly prevent the rise of *sectarian distinctions*. The Vishnuvites and Sivites, without an absolute separation, have each adopted a train of opposite worship and observances. Contrary to the toleration generally prevalent in India, they engage in violent quarrels, which often come to blows, on the merits of their respective systems. The Vishnuvites lead a wandering, irregular life, like gipsies. The *Jains* are entire separatists. Instead of one supreme being, they worship

mortals exalted into deities ; but their habits of life are strict and austere. The Boodhists, or followers of Boodh, profess a creed somewhat similar, but with a much more entire separation. Originating in or near India, they have been almost expelled from that country, but have obtained the supreme religious sway in Thibet, Tartary, and the whole east of Asia. We shall therefore have opportunities to treat of them more particularly.

4140. *The literature of Hindostan* rests, like its social state, almost entirely upon its religion. To all the books which it owns as valuable or classical, a divine origin is ascribed. The four Vedas, the grand basis of Hindoo learning, are believed to have issued simultaneously from the mouth of Brahma, though they are strangely enough supposed to have required the labours of Vyasa, a learned Brahmin, to bring them into a state fit for perusal. They consist in a great measure of invocations or addresses to the multifarious deities worshipped throughout India, many of which, when duly repeated, are supposed to have the power of charms, calling down good on the worshipper and his friends, and the most dreadful evils upon his enemies. They contain also precepts for the conduct of life, various in character and merit ; with a full exposition of the national creed respecting the origin of the gods, the creation of the world, a future state, and the transmigration of souls. They are illustrated by the Sastras and other most extensive glosses and comments ; all of which, like the original, are supposed to be the result of inspiration. This primary fountain of Indian knowledge is carefully shut, unless to Brahmins : none of any other class must throw his eyes on these sacred pages, or even understand the language in which they are written. Second to them are the Puranas, which, like the Vedas, are composed almost entirely in verse ; and the ten Puranas contain nearly half a million of stanzas. They form a strange and heterogeneous medley of sound precept, useful doctrine, wild fable, and directions for puerile observances. The narrative part relates rather to the gods than to men ; but these superior natures are exhibited as conforming very ill to the duties which are inculcated upon mortals ; bloody wars and licentious amours forming the exploits most frequently recorded. Below the Puranas in celebrity and sanctity are the Mahabarat and Ramayana, two great epics, or rather wild metrical romances, similar in strain to the Puranas ; for, though the basis be narrative, they abound in precept ; and though they profess to detail the adventures of human heroes, the actors and the events are almost wholly supernatural.

4141. In this enumeration, which includes all the serious literature of Hindostan, *one capital defect* must be obvious : *history* finds in it no place. Their wild legends are plausibly supposed to have a foundation in the story of some celebrated early kings or conquerors ; but it is impossible, through the mist of fable, even to conjecture any thing precise respecting their real existence. The Iliad and Odyssey are, in comparison, plain and authentic chronicles. Every thing in the shape of history that India possesses is due to her Mahometan conquerors. The geography of the Hindoos, in like manner, is a mere poetical, or rather puerile, delineation, in which they arrange the features of the globe in fancied symmetry, describe it as containing mountains of gold, silver, and gems, seas of milk, clarified butter, curds, and spirits. Their chronology, like that of the Greeks, is divided into four ages, of which three are fabulous ; and the first consists of nearly 2,000,000 years !

4142. *In the mathematical sciences*, the Hindoos possess a considerable share of genuine merit. Algebra, in particular, had advanced farther with them than, till very lately, among the nations of Europe ; since they had made a considerable progress in the indeterminate analysis. Their astronomy has been famed, but with less reason ; for its tables, which have been supposed to indicate observations commencing at 3100 A. C., are now proved to have been calculated at a period much more recent. Even the skill by which they were produced is now extinct ; and the most learned Brahmin of the present day can with difficulty attain a knowledge of the period of eclipses, to be employed by him for the purposes of divination.

4143. *In the lighter and more elegant branches of literature*, India displays greater excellence. The fables of Pilpai, interspersed with moral maxims, possess the highest merit of which that species of composition can boast, and have been translated into all languages. The dramatic literature of the nation is very extensive, being little less voluminous than ours ; and, though defective in plot, and destitute of the varied merits which characterise the works of a Shakspeare, a Racine, and a Molière, presents many passages distinguished for sweetness, pathos, and humour. Love, too, forms a copious theme ; and the amatory poets of India are eminent, though none of them has attained the fame of Hafiz. These compositions, however, want the genuine language of passion : they are distinguished by splendid imagery, but empty profession ; there is something about them stately, sophisticated, and gravely extravagant. It may be observed, with regard to these and to all the other branches of Indian literature, that their productions are ancient ; the language in which they are written is dead ; and we know few Hindoo authors of the present day who are at all distinguished. The Brahmins, who alone ought to be learned, are now almost wholly illiterate. The only tincture of literature and thought appears to exist among some

of the higher inhabitants of the great cities, who have derived it chiefly from intercourse with Europeans, and particularly with the missionaries. Among these, Rammohun Roy is the most distinguished.

4144. *Considering the Hindoos as a refined and wealthy people*, it seems surprising that their *architectural monuments* should at present be of so humble a character. Even their temples, on which a superstitious people might have been expected to spare neither cost nor art, are immensely numerous, indeed, but both small in size and rude in structure. This character does not apply to the ancient religious edifices. The pagoda of Tanjore, and the mighty excavations of Ellora and Elephanta, present features which may rival the most splendid of those found in other Oriental empires. Temples erected even in the small Rajpoot principalities display a beauty rivalling those of ancient Egypt and even of Greece. Colonel Tod conceives, indeed, that Hindoo art has undergone a progressive degeneracy; and the more ancient the specimens are, they are always the more valuable. Since the sway of Mahometan nations was established in India, all the finest structures have been reared by them, and in their own peculiar style. The mosques and tombs constructed by Akbar, Shah Jehan, and Aurengzebe rank with the most splendid specimens of Saracenic art. The palaces are also magnificent, yet built in a light and airy style, rather resembling pavilions. They are contrived for the admission of air from every point of the compass: they have spacious halls, long galleries, projecting roofs, and terraces open to the sky, with accommodation for sleeping there when the weather permits. They enclose shaded courts, gardens full of trees, marble baths, jets d'eau, arbours; every thing which can prevent the heat from being painfully felt. The great display of wealth is in the furniture, particularly in the fabrics of silk and cotton ornamented with gold, which are either spread on the floor and seats, or hung round the walls. The throne of the Mogul was estimated at 4,000,000*l.* sterling, made up by diamonds and other jewels, received in gifts during a long succession of ages. Meantime, the habitations of the ordinary class are of the humblest description, rudely composed of canes and earth, and roofed with thatch. Irregular collections of these hovels, like clusters of villages crowded together, form the main composition of the greatest Mogul capitals, the splendour of which consists wholly in a few great streets or squares, formed by the houses of the grandees.

4145. *The vestments of the Hindoos are suited to the climate, and composed of the manufactures of the country; they consist of long flowing robes of cotton, both loose and light (fig. 618).* In some of the higher regions only, coarse woollens of home manufacture are preferred. The clothes worn by the higher ranks do not differ much, unless in their superior fineness; but the rank of the wearer is indicated by a profusion of jewels, embroidery, and gilding, the display of which caused the Mogul court in its glory to be regarded as without a parallel in the world. The fallen princes and soubahs, who have risen upon its ruins, console themselves by maintaining as much of this parade as their reduced revenues will support.

WOMAN OF DISTINCTION.

4146. *In regard to diet*, the Hindoos practise abstemiousness more than any other nation; and this from feelings not merely of duty, but of pride. The man who consumes, or even tastes, animal food or spirituous liquors, is considered by all the higher castes as an impure and degraded being, who must be thrust out from among them, and doomed to mingle with the vilest of his race. Rice and water suffice for the food of the purest classes, and scarcely any who have the slightest pretension to caste will admit within their lips a morsel of beef. The scruple diminishes as we descend; but it is only among the outcast classes that intemperance is found to prevail. The Mahometans, though by no means so scrupulous, are yet temperate. Their chief luxury is fruit, the best of which, being brought from the mountainous regions round India, is seen only at the tables of the great.

SECT. VII. *Local Geography.*

4147. *In surveying that vast field which the local geography of India opens*, we shall reduce it into four subdivisions: the Bengal provinces, including the former seats of Mogul empire; the western provinces; central India; the south of India; and, lastly, the countries on the Himalayah.

SUBSECT. I. *Bengal Provinces.*

4148. In pursuing the local survey of Hindostan, it will be expedient to begin with *Bengal*, the most fertile province, and, since it became the seat of the power which rules over Hindostan, the centre of political influence. The Bengal *presidency*, the greatest of the three into which British India is divided, comprises much more than the mere province of that name. It is a great empire, extending over all the fine regions watered by the Ganges

and the Jumna, and comprising the provinces, or rather kingdoms, of Bengal, Bahar, Benares, Oude, Allahabad, Agra, Delhi, and Orissa. These territories, according to estimates made with some care, were supposed to contain about 220,000 square miles, and 40,000,000 inhabitants. Within this presidency are forty inferior courts, stationed at the principal towns, six courts of appeal, and one supreme court at Calcutta.

4149. *Bengal Proper* consists of a vast alluvial plain, intersected by the lower courses of the Ganges and Brahmapoutra, with their numerous branches. These, during the rainy season, which lasts from June to September, inundate the whole country, and convert it into a sea, extending for hundreds of miles in every direction. The whole region is then navigable, and boats are seen sailing through the cornfields, in which the ears of rice appear above the water. The soil consists entirely of sand and clay, not a rock or even a stone, being found for 400 miles up the Ganges. Fields thus profusely irrigated produce immense crops of rice, of which Bengal is the chief granary. The sugar-cane also flourishes; but the other Indian products are not so copious as in the upper provinces. The mango, that most delicious of Oriental fruits, grows here in perfection; but other fruits and culinary vegetables are watery and insipid. A great trade is carried on, up and down the Ganges, in boats of various form and dimension, the navigation of which is supposed to employ nearly 300,000 men. The main staple of their trade is the conveyance of rice from the country districts to the great cities, and salt from the coast to the interior.

4150. *Nearly the whole sea-coast of Bengal* consists of the Sunderbunds, extending for about 180 miles. The Ganges, in entering the sea by eight large mouths, divides itself into a labyrinth of streams and creeks, through which boats make a difficult and perilous passage amid conflicting tides and eddies. The lands intersected by these numerous channels, being inundated by the water, which is every where salt, have never been brought under any regular culture. They form a vast desert, overgrown with thick forests, whence Calcutta is supplied with wood for firing, and for the building of boats. These extensive marshes afford also the opportunity of producing, by mere solar evaporation, large quantities of excellent salt, for which there is a constant demand in the upper districts of India. The Ganges appears, in the course of ages, to have experienced successive alterations in the main channels by which it is entered. The only one at present navigable for large vessels is the most westerly, called the Hoogly, but which by no means transmits the main body of its waters.

4151. On the Hoogly branch is situated *Calcutta* (*fig. 619.*), which, from a few

CALCUTTA

straggling cottages in a wooded marsh, has been raised by Britain to be the capital of India. In 1696, the English were allowed by Aurengzebe to establish a factory, and in the following year to secure it by a fort. In 1757, it had not above seventy English houses, when it was taken and destroyed by Surajah Dowlah. Lord Clive, having become mas-

ter of Bengal, made Calcutta the capital, and founded a fort, which has cost about 2,000,000*l.*, and is very strong, though requiring at least 10,000 troops for its defence. Calcutta has from that time been perpetually increasing, and is supposed to contain 500,000 inhabitants; while, within a radius of twenty miles, there are upwards of 2,000,000. The situation was originally very unhealthy, being in the midst of forests and swamps; and, though these have been in a great measure cleared away, it still suffers by the damp breezes from the Sunderbunds. The English town, or suburb, called Chouringee, consists of 4300 houses. Though built only of brick, it is elegant, and even superb; the houses are handsome, covered with fine plaster, called chunam, each being detached, and surrounded by a wall. Strangers ascending the river are particularly struck by the number of elegant villas, with which all the environs are studded. The Black Town, comprising much the greater part of Calcutta, consists, as in other parts of India, of miserable cottages of mud and bamboo. The government house is a very splendid and costly structure; and considerable state is maintained, though not to that degree which can rival the parade of Asiatic courts. A college was founded by the Marquess Wellesley, which boasted many illustrious members, but has of late been much reduced. The allowances to all the servants of government are liberal; and though their aim, in going out, has generally been to return with an independent fortune, they indulge in a hospitable, splendid, and expensive style of living. Large dinner parties, in preference to public amusements, form the favourite recreation.

4152. Calcutta, on the west, touches almost immediately on the frontier of the province of Orissa; but, before ascending into the interior, we must take a view of *Chittagong*, the most easterly district, situated beyond the estuary of the Brahmapoutra, and touching almost immediately on the Birman frontier. A large part of it consists of mountain and woodland tracts, through which roam large herds of wild elephants; but other tracts are very well adapted for cultivation; and the result of enquiries made by the Marquess Wellesley gave reason for computing its inhabitants at 1,200,000. The agricultural population are called Choomeas: they live, in a peaceable manner, under a rajah who pays a tribute to government; but the interior is occupied by the Kookies or Lunctas, who live almost the life of savages; have their villages on the top of high hills, surprise their enemies in the night, massacre the males, and carry off the women and children as slaves. Islamabad, the capital, is an ancient city, on a navigable river, with a tolerable harbour; and attempts have been made to render it the emporium of Bengal; but the difficulty of communication with it has always secured the preference to the western ports.

4153. *Returning to Calcutta, and ascending the Hoogly branch*, we come first to *Serampore*, a neat thriving little town, at which is a Danish settlement. This place is interesting as the seat of the Baptist missionaries, who have distinguished themselves by such learned and extensive labours in the pious task of translating the Scriptures into all the languages of India, and even of China. About twenty miles above Calcutta is *Chandernagore*, noted as the capital of the settlements belonging to the French in Bengal. It surrendered, however, to Lord Clive; and, though restored, has never regained any importance. Six miles higher is Hoogly, for several centuries the port of Bengal, and the seat first of the Portuguese, and afterwards of the British and Dutch factories. It ranked at one time among the greatest Indian emporia; but, on the rise of Calcutta, gradually lost its splendour, though it is still populous and considerable.

4154. About 120 miles above Calcutta, and on the same branch, occurs *Moorshedabad*, made, in 1704, the capital of Bengal, and still the residence of the Nabob, who, being allowed a handsome pension by the British government, lives in considerable state. This city, and the contiguous one of Cossimbuzar, also large and populous, situated on an island in the Ganges, form the main seat of the silk manufacture, which is nowhere else in India carried to equal perfection. The fabrics are chiefly taffetas, satins, carpets, and knitted stockings.

4155. *To the west of the line* up the river, are the districts of *Burdwan* and *Birbhoom*, the former of which is reckoned nearly the most fertile in India. Though only seventy-three miles long and forty-five broad, it maintains a population of 2,000,000; and the rajah, as zemindar, pays a revenue of 400,000*l*. It is entirely agricultural, and contains no town of importance.

4156. To the east of this line, also between the Ganges and the Megna or Lower Brahmapoutra, is *Dacca*, a very fine and interesting district. Wholly intersected by these rivers and their branches, it is liable to extensive inundations, which often alter the boundaries of fields, and convert many into jungle, while to others they communicate extreme fertility. Dacca is the chief seat of the muslin manufacture, and its fabrics of this description are the finest and most beautiful in the whole world. Of late, however, the demand has so much diminished, that the hereditary skill by which this beautiful art is preserved is in danger of being lost. Cotton quilts, dimities, and cloths are also manufactured. Dacca was the capital of Bengal in the reign of Jehangire, and is still a very large city. It contains 150,000 inhabitants, displays no particular splendour, but is the seat of a great trade.

4157. We return to the Ganges; and, joining its main stream, soon discover the remains of *Rajemahl*, the residence of the soubahs of Bengal under Aurengzebe, and celebrated even in the East for its magnificence.

620

MINARET AT GOUR.

Marble halls and deserted courts mark the departed grandeur of the palace of Sultan Shujah. A little to the north, on a river which falls into the Ganges, is *Maulda*, a thriving place, with considerable manufactures of silk, and of mixed silk and cotton. A few miles from Maulda, along a branch of the Ganges now dried up, extend for many miles the remains of *Gour*, which, in the thirteenth century, the Mahometan conquerors established as a proud capital of India. The materials appear to have been carried away to form modern cities; a great part of the present site consists of jungle, the abode of tigers; but wherever cultivation takes place, the brickdust in the soil indicates ancient habitation. A diligent search has recently discovered the remains of a considerable number of mosques and palaces. One minaret (*fig. 620.*), represented by Mr. Daniel, displays the traces of peculiar magnificence.

4158. *Upper Bengal* presents a considerably different aspect from the lower province. The climate is cooler; and wheat and barley are raised, in preference to rice. The northern tracts are hilly and irregular, inhabited by a race of short, stout, rough mountaineers, who sometimes annoy the inhabitants of the plains, but who display an honesty and veracity very superior to that of Hindoos in general. The Ganges, which had hitherto spread its waters so wide over the plain, is now confined between granite rocks, which at Sicrygolly approximate so closely, that attempts were made to defend the passage by a fortification, now abandoned to decay. On emerging from this narrow pass, we enter another district.

4159. *Bahar*, though properly a distinct province, is often almost identified with Bengal. The territory is fertile and beautiful; not so copiously inundated, but still well watered by the Ganges and numerous tributaries, particularly the Soane, from the Vindhya chain, and the Gunduck from the Snowy Mountains. In preference to rice, it yields very fine wheat; but opium and saltpetre, both excellent and in large quantity, form its characteristic products. It abounds also in all the manufactures of India, though none of them attain the same unrivalled excellence as at Dacca and Moorshedabad.

4160. *The Ganges is still the line* upon which the great cities are situated. *Monghir*, capital of a fine district of the same name, is a considerable and ancient town, commanding a peculiarly admirable view along the banks of the Ganges. It was the frequent residence

of Sultan Shujah, and Cossim Ali Khan, who bestowed great pains in erecting a very strong fort for its defence. To this erection the British government have ceased to attach much importance, since their dominions were extended so far to the westward as to render Monghir no longer a frontier station. Somewhat lower down is Bogliipoor, a neat manufacturing town, which sometimes gives name to the district.

4161. *The city of Bahar* stands at some distance from the river; and, though the ancient capital, and even a royal residence, has now fallen much into decay. The chief city of the province, and one of the greatest in India, is *Patna*, extending about four miles along the river. It has been supposed to be the ancient Palibothra; at all events, it is of considerable antiquity, and was the residence of the soubahs of Bahar before its government was merged into that of Bengal. There are a number of mosques and temples; but the only part of the city which can be considered handsome is the suburb of Bankipoor, occupied by the British residents. The prosperity of Patna is founded on the fertility and high cultivation of the district in which it is situated, and on its importance as the emporium for the staple products of opium and saltpetre. Dinapoor, in the vicinity of Patna, forms a fine military station. Gaya, about fifty miles south of that city, and on a tributary of the Ganges, is one of the holy cities of the Hindoos, and the scene of a most crowded pilgrimage. About forty miles above Patna, the Ganges receives the Gogra, the second of its tributaries in magnitude; and, soon after passing Buxar, a strong fortress, now dismantled, we quit Bahar.

4162. *Allahabad*, the next province, is very extensive, reaching farther north and south of the river than

621

BENARES.

more than 200,000; but it is augmented, at solemn seasons, by pilgrims to a much greater number. Benares, in fact, presents a more lofty and imposing aspect than any other Indian city. Its houses, instead of being a

622

CHUNARGHUR.

converted by the British into a great military station. It was anciently a town of great importance, and contains a mosque, the entrance to which has been delineated by Mr. Daniel, as one of the finest examples of this species of architecture (fig. 623.).

4163. *The next division of the province*, in ascending the river, is that of *Allahabad Proper*. It is highly

623

ENTRANCE TO A MOSQUE AT CHUNARGHUR.

productive, more in wheat than in rice; for, though traversed by the parallel streams of the Jumna and Ganges, it is little inundated, and the water, so essential to the growth of rice, requires to be conveyed by laborious processes over the fields. The city is extensive, but not distinguished by any peculiar magnificence or ornament. Its chief feature consists in the fortified palace (fig. 624.), begun by the emperor Akbar, on which upwards of 12,000,000 rupees are supposed to have been expended. It is of surprising extent, having one side on the Jumna, and the other near the Ganges, which rivers here unite. It was considered by the Hindoos as impregnable; but, not being found proof against cannon, the English have fortified it in the European manner, and have made it a grand military depôt for the upper provinces. The Hindoos regard with religious veneration all junctions of rivers, particularly with the sacred stream of the Ganges. This junction, therefore, of the Ganges with its greatest tributary becomes, without dispute, the holiest spot in all Hindostan. Accordingly, it attracts hosts of pilgrims of

along its banks: the latter portion, however, is by much the finest. The first district which occurs is that of Benares, considered sometimes as a separate province, and even occasionally annexed to Oude. It is supposed, with the single exception of Burdwan, to be the richest and most cultivated district of all India, and, within a narrow compass, contains a population of 3,000,000. Its chief ornament, however, is the city of *Benares* (fig. 621.), which is universally accounted by the Hindoos to be ancient and holy beyond all others. It may be said to form the grand depository of the religion and learning of this vast country. Its sacred character, which is supposed to ensure the salvation of all who die within its precincts, cannot fail, in a nation devoted to pilgrimage, of rendering Benares a scene of extensive and crowded resort. Its own population, long supposed to exceed 500,000, has been found by a late census not to be

mere collection of mud and straw huts, are most of them built of brick, and some of them five or six stories high; so that they make a very magnificent appearance, especially from the opposite side of the river. Partly, however, with a view to coolness, the streets are very narrow, with small windows, and terraced roofs. Benares contains also temples and mosques in vast numbers; though, as in the case of other modern Hindoo structures, not on a scale commensurate with the grandeur of the country and city. The greatest of them was levelled to the ground by Aurengzebe, who in its stead erected a mosque, which now forms the principal ornament of Benares. Chunarghur (fig. 622.), near Benares, is one of the strongest of the Indian hill forts, and has been

that of *Allahabad Proper*. It is highly productive, more in wheat than in rice; for, though traversed by the parallel streams of the Jumna and Ganges, it is little inundated, and the water, so essential to the growth of rice, requires to be conveyed by laborious processes over the fields. The city is extensive, but not distinguished by any peculiar magnificence or ornament. Its chief feature consists in the fortified palace (fig. 624.), begun by the emperor Akbar, on which upwards of 12,000,000 rupees are supposed to have been expended. It is of surprising extent, having one side on the Jumna, and the other near the Ganges, which rivers here unite. It was considered by the Hindoos as impregnable; but, not being found proof against cannon, the English have fortified it in the European manner, and have made it a grand military depôt

whom many endeavour to secure a happy futurity by seeking death in its hallowed stream. The most approved mode has been, for the devotee to cut off his own head, and allow it to drop in, as an offering to the Gangetic deity. Not far from Allahabad is Mirzapore, one of the greatest inland trading towns of India, a great mart for cotton and spun silk, and the seat of very considerable manufactures.

4164. *The other districts of Allahabad* extend chiefly south-west from the Jumna towards the Vindhya

FORTIFIED PALACE AT ALLAHABAD.

mountains and the head of the Nerbudah. This territory is of great extent, but, being hilly and often arid, is by no means so productive as the tract watered by the two rivers. It is a very strong country, the hills generally presenting that form of precipitous sides, with a table-land at top, which renders them, as natural fortifications, stronger than any which can be made by art. To the greater part of this district is given the name of Bundelcund, the chief city of which is Callinger, the strongest fortress of the character we have just described, and the rival of Gwalior. It was long held by an independent rajah, even against the Mogul; but in 1810, by prodigious efforts of valour, and after one severe repulse, the British became masters of it. Cawnpore, on the Ganges, has become highly important as a military station. Bundelcund is distinguished by the diamond mines of Pannah, which, though not in any respect equal to those of Golconda, are of great value. In the time of Akbar, their annual produce was estimated at eight lacs of rupees; but it is now much diminished.

4165. *The province or kingdom of Oude* extends north from Allahabad, near whose eastern frontier the Ganges, as already mentioned, receives the Gogra or Sarayu, which is its greatest tributary next to the Jumna; and forms a broad and copious stream descending from the Himalayah. Its course had previously watered the plain of Oude, a rich territory, the lower districts of which are not inferior to those of Bahar and Benares, on which they border; and the upper, though not equal, by no means barren. By the treaty of 1801, a large and valuable portion was ceded to the British; the nabob retains the rest, and continues to reside, in diminished splendour, at Lucknow. This city, while the nabobs of Oude were in full power, ranked with the most splendid in India. Sujah ul Dowla, who had a peculiar architectural taste, embellished it with a number of mosques and palaces, with varied ornaments and gilded domes, which have a very brilliant effect. The population has been reckoned at 300,000, but is probably diminished. Oude, the earlier capital, is in ruins; but Fayzabad, which succeeded it as such, is still a populous city.

4166. Proceeding up the parallel streams of the Ganges and Jumna, we find the space between them, and for some distance westward, occupied by the province of Agra. This extensive territory presents sensible indications of its approach to the great mountain territory of India. The climate, unless when hot winds blow, is cool, and even actually cold; and the rivers, less ample, and confined within higher banks, administer sparingly the boon of moisture. It derives its chief lustre from containing Agra, one of the great Mogul capitals. This it owed to Akbar, who, from a village converted it into one of the greatest cities of Asia. It completely shared, however, the fall of the dynasty, and the greater part of it is now in ruins. Yet the eye may still range over a vast extent of country, covered with the remains of ancient magnificence. The houses, like those of Benares, are high, and the streets narrow. The vicinity is adorned by the palace of Akbar, and still more by the Taje Mahal (fig. 825.), erected by Shah Jehan, in memory of his sultana; which

GATE TO THE TAJE MAHAL.

is reckoned the finest tomb in the world. It is composed entirely of white marble, inlaid with precious stones, and is said to have cost 750,000*l.* Agra, since its capture by General Lake in 1803, has remained in the possession of the British, and is become the seat of one of their grand courts of justice and revenue.

4167. *Secundra and Muttra* are two ancient and remarkable cities, situated on the Jumna a little above Agra. The former, now in ruins, is only distinguished as containing the splendid and ornamented tomb of Akbar (fig. 626.), composed entirely of white marble. Muttra is one of the most ancient and venerated Hindoo cities, considered by Heber as almost resembling Benares. It is still a considerable place, and important as a military station.

GATE TO MAUSOLEUM OF THE EMPEROR AKBAR.

4168. *The finest and most fertile part of the province of Agra is the Doab*, or the country between the rivers; and it is in the immediate occupation of the British government. Within this district are the remains of Kanoge, now a poor village, situated to the west of the Ganges, but whose brick walls, extending for six miles, attest the ancient grandeur of a capital which, eight centuries ago, ranked superior to any other in northern Hindostan. A Hindoo temple, and the mausoleum of two Mahometan saints, still display magnificence; and

a number of ancient coins have been dug up on the spot. Furruckabad, capital of a small district of the same name, is a thriving commercial city.

4169. *Agra, west of the Jumna*, is divided into two parts by the tributary stream of the Chumbul, flowing eastward from the vicinity of Oojein. The northern part is held by a number of rajahs, whom fear or policy maintains in a dependent alliance with Britain. They belong chiefly to the warlike tribe of the Jauts, who, in the seventeenth century, migrated from the banks of the Lower Indus, and, availing themselves of the distracted state of the empire, seized a number of the strongest places in the district. The capital of their most powerful chief is Bhurt pore, perhaps the most formidable of all the mountain fortresses of India. Its siege in 1805 cost the British army a greater loss than it had sustained in any three pitched battles; and the rajah, at the close of it, was able to secure very favourable terms. In 1825, however, it yielded to the British arms. The province to the south of the Chumbul was allowed by the treaty of 1805 to be annexed to the territories of Scindia. It contains also a number of hill forts, among which is pre-eminent Gwalior (*fig. 627.*)

627

Gwalior.

not of the same military strength. Its rajah acted for some time an important part in Indian politics; but he is now almost entirely dependent upon Scindia.

4170. Continuing to ascend in a north-westerly direction up the great rivers, and approaching to their mountain sources, we find *Delhi*, raised latterly to high distinction as the chief seat of Mogul empire. This province is ruder, and less susceptible of culture, than any of those hitherto named. Few parts of it enjoy the benefit of inundation, except the banks of the Cunggar; while artificial irrigation and agricultural improvement have been almost annihilated by the desolating ravages, first of Nadir Shah, and subsequently of the Afghans and Mahrattas. The central district of the province between the two rivers is held by the British in immediate sovereignty; and, notwithstanding some defects of administration, it is

628

JUMNA MUSJEED, AT DELHI.

Shah Allum, the last of that mighty dynasty who could be said to enjoy any portion of real empire. His son Akbar is still allowed by the British to bear that great name, and to

receive a considerable proportion of the revenues of the province, which enables him to live in some splendour. What remains of Delhi is still rather a handsome city; the streets, though narrow, contain many good houses, built of brick, and partly of stone. It contains some manufactures of cotton cloth, and is the rendezvous of the caravans which maintain the communication of India with Cabul and Cashmere. The palace of Shah Jehan, with its gardens, a mile in circumference, bears still a most magnificent aspect, particularly its gateway; but a long range of those belonging to the great chiefs and omrahs of the empire, adorned with gilded mosques, pavilions, and tombs, now present only one vast scene of ruin and desolation.

629

CUTTUB MINAR.

4171. *Delhi* contains the most splendid modern edifices by which any part of the empire is adorned. The mosque called the Jumna Musjeed (*fig. 628.*), erected by a daughter of Aurengzebe, of red stone inlaid with marble, is considered decidedly the finest structure in India dedicated to Moslem worship. The Cuttub Minar (*fig. 629.*),

which, for natural strength, has scarcely, perhaps, its equal in the world. It consists of a table plain a mile and a half long, and less than a quarter broad; and, being surrounded on all sides by a precipitous face of rock, was supposed impregnable, till, in 1780, it was carried by escalade by Major Popham; and again, in 1804, so formidable a breach was effected by Colonel White, as to cause its surrender. Lord Cornwallis afterwards ceded it to Scindia, the Mahratta chief, who has made it his capital; an act of his lordship which has been considered more generous than politic. Gohud is also an important place, though

sensibly recovering, and its population is increasing. On the banks of the Jumna, near the northern frontier, is found, mouldering in decay, the city of Delhi. It was, in early times, a great Hindoo metropolis, under the name of Indraput; but Shah Jehan, in the middle of the seventeenth century, made it the chief seat of Mogul dominion, and such it afterwards continued. Here, in 1806, died

reared by one of the Patan emperors named Altumsh, is 242 feet high, and considered by Bishop Heber the finest tower he ever saw. It rises in five stages, the three lowest of which are of fine red granite, the fourth of white marble. The summit commands a most extensive prospect.

4172. *In the northern part of the province of Delhi*, to the east, are the large and industrious towns of Bareilly, Meerut, Shahjehanpore, and Rampore. The two former possess importance as military stations, and the barracks at Meerut are very extensive. A large Christian church has recently been erected there.

4173. *The north-western part* is composed of the district of Sirhind, which is now chiefly possessed by the Seiks. Though traversed by the sacred stream of the Sereswattee, it is for the most part arid and barren. It has been further desolated by the hostile operations of the Seiks, and has also suffered from the ravages of the Persian and Tartar conquerors, having been the regular track by which they penetrated into Hindostan. The city of Sirhind, celebrated, under Sultan Feroze, in the fourteenth century, as a gay and flourishing capital, is now in a state of total ruin. The most flourishing place in the district is now Patiala; but a greater historical celebrity belongs to Carnoul and Panniput, one the scene of the victory of Nadir, the other of that of Ahmed Shah, which broke the power of the Mahrattas.

SUBSECT. 2. *Western Provinces.*

4174. As it is intended to treat separately of the territory situated along and within the great range of the northern mountains, we shall proceed direct from Delhi to *the provinces on the western frontier*. This range by no means presents the luxuriant and fertile aspect of those watered by the Ganges and its tributaries. It consists of a vast plain of sand, whose uniformity is only broken in the north by the Punjab, or the region of the five rivers, which, descending across it from the Himalayah, enter the Indus by one united channel.

4175. *Lahore*, the chief of the western provinces, includes the greater part of the Punjab, with a considerable extent of mountainous territory to the north. This last is by no means unproductive; the earth washed down by the rains being formed into terraces by parapets of stone. Thus, all the kinds of grain peculiar to the temperate climates are raised in abundance, and even large forests of firs grow on the higher acclivities. The finer and more beautiful part of Lahore, however, is that situated on the rivers, where the plains are covered with the richest tropical productions, and, in the days of their prosperity, were regarded as almost the garden of India. But the ravages of the Persian and Afghan conquerors, and the rude sway of the Seiks, have reduced culture and industry to a low ebb; but it has of late begun to revive. Very fine salt and salgem are found on the banks of the Indus, which, at Attock, is crossed by a range principally composed of this mineral.

4176. *Lahore* has now entirely fallen into the possession of the *Seiks*, who, from a religious sect, have become a great political body; and, as such, have been already described. Besides Lahore, they occupy, as has been seen, the north-west of Delhi, and the greater part of Moultan; and are the most important native state now existing. The Mahometans, formerly the ruling people, are kept by them in a completely subject and degraded state, and are allowed even a scanty measure of religious toleration. The disunion of the Seiks, and their rude habits, are unfavourable to industry and commerce, which would have required a protecting hand to enable them to emerge from the effects of long civil contest, and of the repeated passage of desolating armies from Persia and Afghanistan. Although, therefore, the Seik chiefs are beginning to see their error, and are endeavouring to afford encouragement to trade, the country has lost much of its ancient fertility and beauty, and does not contain a population adequate to its extent.

4177. *Lahore*, the nominal capital of this province, was one of the most beautiful cities of India, when, under the early Mogul princes, it was made an intermediate residence between Cabul and the interior. Akbar, Jehangire, and Ferokshere successively contributed to its embellishment. The mausoleum of Jehangire, only surpassed by the Taje Mahal at Agra, is still nearly entire; and there are ample remains of the palace adorned in the highest style of Eastern magnificence. Its terraced roof, covered with a parterre of the richest flowers, suggests the idea of the hanging gardens of Babylon. All, however, went rapidly to ruin, under the multiplied desolations which Lahore has suffered; though its situation, on the fertile banks of a fine river, and on the high road from India to Persia, must always secure to it a certain degree of population and wealth. Recently, also, Runjeet Sing, the supreme Seik chief, has made it his capital.

4178. The importance of Lahore is, in a great measure, shared by *Amritsir*, the holy city of the Seiks, and the rendezvous of their *gurumata*, or great national council. The object of attraction here is a tank or pond, formed by Guru Govind, an early chief and saint, who gave it the name of the "pool of immortality," and taught, that those who bathed in its waters were purified from all sin. This belief has led to an immense concourse of the sect, whose contributions support a large temple, built in the midst of the water, with 600 acalies or priests attached to it. Amritsir is an open town; but it contains the strong fort of Govind Garrah, in which Runjeet Sing keeps his treasure and arsenal. It is eight miles in circumference, well built of brick, but without any structures of peculiar magnificence. It forms the centre of a considerable caravan trade with Cashmere; and, from the security found there amid recent revolutions, it has been chosen as a residence by the chief monied men in this part of India.

4179. To the south of Lahore is *Moultan*, an appellation which Mr. Elphinstone reduces within very narrow limits, by confining it to the district immediately dependent on the city of that name, and excluding those of Bahawalpore and Leia; but we shall adhere to the original Hindoo idea, which comprehends under Moultan all the lower course of the five rivers after their union into two great channels, and thence westward to the Indus. These rivers roll through a desert; but the partial inundation, and the conveyance of the water over the fields by Persian waterworks, diffuse fertility to a considerable distance on each side of their banks. Their immediate vicinity, indeed, is in some places covered with mud so soft, that it cannot bear the tread of a horse. Wheat and cotton are the most valuable products. Agriculture, however, with its essential process of irrigation, exhibits visible marks of decay, consequent upon the successive conquests and inroads to which the land has been exposed. The whole of this province, lately tributary to the king of Cabul, is now under the dominion of Runjeet Sing, chief of the Seiks. *Moultan* is a fine city, about four miles in circumference, and surrounded by a very handsome wall. It contains a temple of great antiquity, highly venerated, and the object of crowded pilgrimage from all parts of India. There are also several very beautiful tombs, covered with high cupolas of glazed and painted tiles. It is distinguished by manufactures of silks and carpets, the latter in imitation of those of Persia, but of inferior excellence.

4180. Beyond the river Gharra, which forms the eastern boundary of Moultan Proper, stretches *the district of Bahawalpore*, governed by Bahawal Khaun. Near the river it is very fertile; but, in receding, it passes into almost complete desert, of which the greater part of this extensive tract consists. It extends also south, occupying a considerable reach of the banks of the Indus. Bahawal Khaun, the most powerful chief in this tract, raises a revenue of 1,500,000 rupees. He maintains a well-appointed army of 10,000 men, and has a cannon foundery, which supplies him with good and well-mounted guns. The city of Bahawalpore is as

extensive as Moulton, but not so populous; a great part of its area being occupied in gardens. The houses are built chiefly of unburnt brick. It is remarkable for the manufacture of *loongees*, or silken girdles, and of turbans.

4181. *The western part of Moulton*, between the Acesines and the Indus, composes the district of Leia. Every thing here begins to assume an Afghan aspect. The mighty snow-covered mountains of that country appear in the distance; the higher ranks of the people affect the Persian language and manners; and the farm-yards and agricultural economy display that superior neatness, and those almost European modes of management, which characterise the countries beyond the Indus. The territory at all remote from the river is little better than a desert. The chief raises a revenue of 500,000 rupees. His armed force consists of two regiments of musketry, and 5000 cavalry. Leia being a poor village, the residence of the rajah is at Bukhur, a flourishing little town near the Indus.

4182. *The population* of the whole province of Moulton is properly neither Hindoo nor Afghan. It consists of Jauts, the race whom we have noticed in the western parts of Agra, and of colonists from Beloochistan: these people are all Mahometans. There is an intermixture of Hindoos, which is greater in the more easterly tracts, but nowhere composes the leading race. Camels are extensively employed for the purpose of travelling over the vast bordering deserts.

4183. *The lower Indus*, after receiving by one channel the united waters of the five rivers of the Punjab, flows for a great space through a region which, beyond its immediate banks, is almost entirely desert. Its character, however, changes when separating into two branches, of which the westerly is the largest: it forms a delta similar, though on a smaller scale, to that of Egypt. This delta, with a considerable extent of territory on each side, forms the kingdom of *Sinde*, which was highly flourishing while it was maintained in a pacific posture under the sway of the Mogul. Its alluvial and inundated territory was kept in high cultivation, and yielded abundant crops of rice, sugar, indigo, and cotton. Tatta, the ancient Pattala, situated on the eastern branch, was then one of the greatest of Oriental emporia. Enjoying a free navigation for large vessels up the Indus as far as Lahore, it became the grand medium by which the products of Western India and Afghanistan were exchanged for those of Malabar and Coromandel, and for European goods. One of the chief materials of trade was afforded by its own manufactures of cotton cloth, which, even in the time of Nadir, are said to have employed 40,000 weavers. Amid the breaking up of the Mogul empire, however, an opportunity was given to the chiefs of a warlike and barbarous race, called Talporee, who occupied the neighbouring deserts of Beloochistan, to seize upon the government. The king of Cabul at one time undertook to drive them out; but found the task so difficult, that he ultimately consented to accept a tribute, which, however, was paid only scantily, when extorted by the appearance of an Afghan force upon the frontier, and has now entirely ceased. The rapacious chiefs who now tyrannise over *Sinde*, strangers to all arts of good government, seek only to extract from the country the utmost present advantage to themselves. In racking the land rents, they have broken up all the old tenures of the husbandman, and deprived him of all permanent interest in the ground. Protection being no longer afforded to commerce and property, the European nations have withdrawn the important factories which they maintained at Tatta; and, of the fleets which formerly navigated the Indus, only small boats are seen ascending and descending. The *Ameers* have increased the desolation, by converting large tracts of the finest land into jungle, with the view of affording the amusement of hunting. To their other violences they add a spirit of bigotry, which impels them to relentless persecution against all who profess the Hindoo religion. The consequence of this misgovernment has been, that the revenue, which amounted at one time to eighty lacs of rupees, sank in 1813 to sixty, and was found by Mr. Burnes, in 1827, not to exceed forty. Yet the *Ameers* are supposed to have amassed a considerable treasure. They are particularly rich in jewels, which they studiously collect, and obtain, often at easy rates, amid the vicissitudes of the Cabul monarchy, from its fallen chiefs. Their collection of muskets and sabres ornamented with gems is supposed to be the most extensive in the world.

4184. *Tatta*, from the causes now enumerated, has two thirds of its area in ruins, and does not contain above 20,000 inhabitants. The streets are narrow and dirty, and the ordinary habitations, as usual in India, are only cottages of canes and mud. The old English factory is still the best house in the place. On a mountain, at the distance of a mile, are an amazing number of tombs, some of them very splendid; but the mosques and pagodas are in a great measure going to ruin. The decay of Tatta is hastened by the transference of the seat of government to *Hydrabad*. This place is situated higher up, about two miles from the Indus, on a branch called the *Fullee*, by which it is formed into an island. There are some manufactures of arms and leather; but, instead of rivalling the former greatness of Tatta, it scarcely equals the present magnitude of that city.

4185. *The sea-coast of the Indian delta*, in consequence of frequent inundation by the salt water, presents a desert of flat and marshy sand, nearly similar to that part of Egypt which immediately borders on the Mediterranean. Somewhat west from the river is *Corachie*, the only sea-port of *Sinde*, and which, from that circumstance, still retains some commercial importance. It contains a population of about 8000 people, among whom the Hindoos are the most active and industrious.

4186. In making a circuit of the Ganges, and down the Indus, we have left an intermediate space of great extent, not traversed by these rivers or by any of their tributaries. This forms the province of *Ajmeer*, or *Agimere*, a rude, mountainous tract, which has scarcely been subdued by any of the conquerors of Hindostan. It is the native seat of that remarkable military race called *Rajpoots*, who present, both in figure and character, a complete contrast to the other Hindoos. They are tall, vigorous, and athletic; all their habits are rude, and their only trade is war. Although their territory approached at several points to within less than a hundred miles of the great Mogul capitals of Delhi and Agra, they never ranked even as regular tributaries of that empire. It was by pensions only that they were induced to join as auxiliaries in war. The Rajpoot chiefs, enjoying thus a succession of hereditary power, unbroken by foreign invasion, boast of a long line of ancestry, and are considered of higher birth than any other Hindoo rulers. Even the Mahratta chiefs, though far superior in power, conceived it an honour to form family alliances with them. They are by no means a degraded and enslaved race, like most other Hindoos; they have *rahtores*, or nobles, of different grades, who owe to the sovereign merely fealty and military service, and are nearly as independent as the chieftains in feudal Europe. Though turbulent and violent, they are considered by Tod as imbued with sentiments of honour, fidelity, and generosity, scarcely known among the inhabitants of the plain. They do not hold the female sex in that degraded state too general over India. The Rajpoot ladies are well informed, and regarded with somewhat of that romantic gallantry which prevailed in Europe during the middle ages. Yet they are guilty of a dreadful enormity, that of infanticide; many of the female children being murdered in the moment of birth: but this is said to be prompted by a preposterous pride, on account of the difficulty of procuring marriages

suitable to their dignity, and even by a consideration of the enormous expense which it is supposed necessary to incur in the nuptial festival. Such is the extravagant display made on these occasions, that a year's income of the state is considered as a moderate amount. The only populous and powerful tract of this province is that reaching from Agra to Guzerat, on the western bank of the Chumbul. The country here does not present the same flat and sandy character as elsewhere: it is traversed by the long mountain chain of the Aravulli, on each side of which extend fine and fruitful valleys. It thus unites great military strength with considerable fertility.

4187. *Ajmeer*, the capital of this province, being near the frontier of Agra, is not held by its native chiefs. It was an occasional residence of the Mogul emperors. For 600 years it has been a favourite resort of Mahometan pilgrimage, as it contains the tomb of a great saint, who is venerated even by the Hindoos. Eleven hundred attendant priests are maintained by the contributions of the pilgrims. The city has still a handsome palace, which was erected by the emperor Shah Jehan; but in other respects it is poor and in decay. The fort, built at the extremity of a range of hills, is of no great strength, but within it is an ancient temple, which Colonel Tod considers as one of the most perfect monuments of Hindoo architecture. The surrounding country is flat and sandy.

4188. *The principal Rajpoot chiefs* are those of Marwar, Mewar, and Jyepore or Jyenagur. The first is the most powerful: the rajah's territories extend along the western border of the Aravulli, passing gradually into the desert. His capital is Joudpoor. His chiefs are brave and daring, and he is considered at present one of the chief native powers of India. He may be regarded as almost independent, though owning the supremacy of Britain. Mewar is a fine and beautiful valley, extending along the eastern side of the Aravulli. Its Rana, as he is called, is accounted the most noble of all these chiefs. His power, however, is inferior to that of the Marwar rajah; and a great part of his dominions, being contiguous to Malwa, the main seat of the Mahrattas, has been exposed to dreadful devastations from them. His capital of Oodipoor, however, is of peculiar natural strength; being enclosed, as well as several hundred surrounding villages, within an amphitheatre of hills, which can only be entered by one deep and dangerous defile. The palace of Oodipoor, on the borders of a beautiful lake, is peculiarly splendid; and that of Jugmundar, on an island in another lake, presents almost a magic scene. Chittore, once the capital, though now in decay, contains extraordinary monuments of ancient grandeur. The great column of victory, 122 feet high, and covered all over with exquisite sculpture, representing the principal objects of the native mythology, has been considered the most perfect specimen of Hindoo art. Jyenagur is the most westerly and the most fertile of these principalities. It is even supposed that, with a better government than it has yet enjoyed, it might yield a revenue of 120 lacs of rupees, about 1,500,000*l.* sterling. The capital, of the same name, is a handsome city, considered the most regularly built of any in Hindostan. The fortified palace of Umeer, built by one of the rajahs, is considered by Heber not inferior to Windsor.

4189. *The principalities now described* are all arranged along the frontier of the central provinces of Malwa and Agra. As we recede thence towards the Indus, we enter a vast and trackless desert of sand, which gives to this part of India an aspect resembling that of Arabia and Africa. Mr. Elphinstone, in his route from Delhi to Cabul, had an opportunity of observing it. The country of the Shekbawuttee, a rude predatory tribe, commencing 100 miles from the first-mentioned capital, was interspersed with cultivated spots, and the sands were sprinkled with tufts of long grass, and of a green plant called *phoke*; and there were towns of considerable magnitude. In the next territory of Bikaner, verdure was found only on detached spots, like the African oases. The traveller, however, was always refreshed with fine water-melons, the most juicy of fruits, which grew with their roots in the sand. The last hundred miles, between Pujul and Bahawulpore, presented a total absence of water or habitation. The ground was a flat of hard clay, which sounded under the feet like a board. Yet this most desolate portion of Ajmeer contains two chiefs of considerable power, those of Bikaner and of Jesselmere. Bikaner is populous, and its walls and towers present the aspect of a great and magnificent city in the midst of a wilderness. The dominions of the rajah of Jesselmere have been still less explored, it being only known that he reigns over a vast extent of desert, thinly interspersed with inhabited tracts; and that the population, composed almost wholly of native Hindoos, have never been subject to the Mogul, even in the greatest height of his power.

4190. To the south of the mountainous and desert tracts of Ajmeer, and forming, as it were, its sea-coast, is the province of *Cutch*, extending from the Indus to the gulf of that name. The sterility here is but partially mitigated, though considerable numbers of horses and cattle are reared, and cotton forms an article of export. The inhabitants consist of a Rajpoot tribe called Jharejahs, subject to chiefs who boast of never having been conquered. Their habits are predatory, and they take advantage of their extensive sea-coast to carry on a system of piracy, for which considerable scope is afforded by the commerce of Malabar. It is remarkable, that the population, though purely native, were converted, without conquest or compulsion, to the Mahometan religion. They practise infanticide to an excess beyond any other tribe, the whole of the female children having long been sacrificed, because peculiar circumstances of situation and taste preclude them altogether from the possibility of obtaining suitable marriages for their daughters. The British government, in a late treaty by which they extended their protection to the chiefs of this district, exacted a stipulation that they should discontinue this criminal system; but Mr. Burnes suspects, from the small number of female children that make their appearance, that it is still extensively practised in the interior of palaces and castles.

4191. On reaching the eastern shore of the Gulf of Cutch, we find ourselves in the province of *Guzerat*, which is peculiarly distinguished for the variety both of its aspect and population. It has districts as fertile and highly cultivated, and commercial emporia as flourishing, as any in India or in the world. Yet other tracts present the same rude and arid aspect, and are filled with the same wild and predatory races, as the desert provinces adjoining. The Gulf of Cambay, by which it is deeply indented, affords very large scope both for commerce and piracy. This situation has produced an unexampled variety of castes and races. Among these, a number who, under the names of Bheels, Callies, Coolees, and Grassias, occupy the ruder tracts in the interior, despise all approach to civilisation, and subsist chiefly by preying on their more opulent neighbours. The unfrequented shores, also, of the gulfs of Cambay and Cutch contain the holds of many desperate pirates. Guzerat has received the remnants of that oppressed and injured race the Magians, or ancient fire-worshippers of Persia, bearing still the appellation of Parsees. They are a peaceable, industrious, well-

disposed people, to whom the province is indebted for much of its commercial prosperity. Surat numbers from 17,000 to 18,000, among whom are some of its richest merchants. They still retain their ancient reverence for fire, manifested by a peculiar reluctance to extinguish it; and also the strange custom of exposing their dead in handsome open tombs, to be devoured by birds of prey, with which their cemeteries are always crowded. They are divided into two classes, the *mobids* and *behdeen*, clergy and laity, who are allowed only under narrow restrictions to intermarry with each other. The female sex are more on a level with the male than in other Oriental countries, and are distinguished by propriety of conduct. The religious sect called the Jains are also very numerous in Guzerat.

4192. *The pride of Guzerat is in its cities.* Surat, at the first arrival of Europeans, was the greatest emporium of India, and at present it ranks scarcely second to Calcutta. The population is usually, though perhaps with some exaggeration, rated at 600,000. It has suffered by the desolation which has overtaken many of the neighbouring districts, and by the British having established the chief seat of their commerce at Bombay. It still, however, carries on extensive manufactures of silks, brocades, and fine cotton stuffs; while it exports also the fabrics of other parts of Guzerat, and even the shawls of Cashmere. At the same time, by the Taptee, Nerbuddah, and the Gulf of Cambay, it introduces foreign commodities of every description into central and western India. It contains many houses handsomely built of stone, but intermixed with those wretched cottages of reeds and mud which form every where the habitation of the ordinary Hindoos. Surat contains many very opulent merchants, chiefly Banians and Parsees. The former carry to a great extent all the peculiarities of their religion, and manifest in a peculiar degree their tenderness for animal life, by erecting hospitals for birds, monkeys, and other animals accounted sacred. Ahmedabad, the political capital of Guzerat, now included within the British territory, and Cambay, its port, at the head of the gulf of the same name, are still flourishing cities, though much decayed since the time when the former was the seat of an independent government. It still, however, remains a gay city, and sends round the neighbouring districts a tribe of itinerant poets, minstrels, and musicians. Baroach, which, under the ancient name of Barygaza, was the chief emporium of this coast, is described by Heber as poor and dilapidated, though situated in a delightful country, and carrying on still some trade in cotton. Baroda, now the capital of the Gwickwar, the principal native chief, is still large and flourishing. Dwaraca, an ancient and sacred city, and Puttun Sumnaut, whose temple, the richest in India, was destroyed in the eleventh century by Mahmud the Gaznevide, are now chiefly remarkable for the crowds of pilgrims which they attract. Diu, situated on an island off this coast, has lost all the importance it possessed at the time when it was conquered by the Portuguese.

SUBJECT. 3. *Central India; with the Deccan.*

4193. On leaving Guzerat, we ascend into *the high and strong centre of India*, the seat of its powerful and refractory tribes, who never fully owned the supremacy of the Mogul, and maintain, even in face of the still more overwhelming power of Britain, a remnant of independence. This character applies peculiarly to the province of Malwa, or, as it has been called, Central India. It occupies that elevated table-land over which the Nerbuddah flows during the greater part of its course, and, being placed at the base of the great southern peninsula, separates Hindostan Proper from what is called the Deccan. According to Sir John Malcolm, this table-land is "in general open, and highly cultivated, varied with small conical and table-crowned hills and low ridges, watered by numerous rivers and small streams, and favoured with a rich productive soil, and a mild climate, alike conducive to the health of man and to the liberal supply of his wants and luxuries." Though considerably above the general level of India, it seldom attains a greater elevation than 2000 feet above the sea. The climate is mild, and the soil, though generally of little depth, is not surpassed in fertility by any part of the empire. The most striking natural feature is the chain of the Vindhya mountains, which, extending from east to west, separates what is reckoned Malwa Proper from Nemaour, or the Valley of the Nerbuddah. The declivity on the Malwa side is small, but on the other is an abrupt and considerable ascent. The Nerbuddah rises near the western extremity of these mountains, in the district of Gundwana, close to the same spot which gives rise to the Soane. Its course is almost due west, parallel to the Vindhya mountains, of which it receives all the southern waters; and continues altogether for about 700 miles. It is not, however, navigable even for boats above 100 miles from its mouth, the upper course being completely obstructed by rocks and shallows.

4194. *The history of Malwa* has been eventful, its strong position having rendered it often the seat of powerful, and even conquering governments. The exploits of Vicramaditya, one of its early Hindoo kings, are much celebrated in Hindoo lore, though in a very indistinct and fabulous manner. Even after the Mahometan invasion, Malwa had Moslem rulers, among whom Mohammed Khiljee was pre-eminent; by him it was raised to a great height of power. As soon, however, as the Mahrattas, amid the decline of Mogul sway, began to pour in from the Deccan, rearing the standard of Hindoo independence, they were received with open arms in Malwa, which had always remained strongly attached to native ideas and institutions. This province soon became the seat of the most powerful chiefs, who thence spread their conquests over Hindostan. In the course of these struggles, a complete ascendancy was gained by the houses of Scindia and Holkar, the founders of which rose from the lowest stations. Setting out in the character of officers of the Peishwa, the acknowledged head of the Mahratta government, they soon became his masters, and were only prevented from entirely crushing his power by the interference of Britain. As soon as her armies came into the field, the pride of these chiefs was humbled; they were confined to the provinces of Malwa and Candeish, and reduced to a tributary and dependent state. In 1817, however, when the bands of robbers, organised under the name of Pindarees, placed the British government in alarm, the Mahratta states manifested a general disposition to seize the opportunity of reasserting their independence. Among the chiefs of Malwa, however, only the Holkar family openly declared themselves. As

they were completely defeated in the battle of Mehidpoor, and all their principal fortresses taken, Britain then dictated the terms of a peace, which established a subsidiary force in Malwa, and placed the capital and the heir of the house within her tutelage. Scindia, on account of some very suspicious movements made by him, was also obliged to receive a British garrison within his strong fort of Asseerghur. His force now consists of about 20,000 foot and 10,000 horse, while that of Holkar is reduced to less than 5000.

4195. *The population of Malwa* has not been accurately ascertained, unless in regard to the territories of Holkar. These, including the domain of some dependent chiefs, were found to contain in Malwa Proper 634,732; in Nemaar, 129,161. A comparison with the extent, gave ninety-eight to the square mile; which might, it was supposed, apply with tolerable accuracy to the whole region. A remarkably small proportion profess the Mahometan faith; in some of the towns, not a twentieth. Those in the country are chiefly converted Hindoos, who, as they still cling to their original rites, are not held in any esteem by the orthodox Mussulman. The country, previous to its conquest by the British, was entirely over-run by professional robbers, acting under hereditary princes. Besides the Bheels on the Guzerat frontier, who boast of an ancient and venerable origin, both to themselves and their calling, there is a numerous class called Grassias, consisting of small chiefs, who have been driven out by more powerful neighbours, but who, mustering round them a few followers, endeavour to maintain by plunder a portion of their former state. With them the British mediated an agreement that they should relinquish this turbulent system, on receiving a revenue or compensation from the lands on which they had any claim.

4196. *Trade and every branch of industry* had sunk to a very low state, in consequence of the continued system of predatory warfare of which Malwa had been the theatre. A caravan of merchants resembled a military expedition, requiring the escort of a large body of troops; and even this precaution did not ensure its safety. The territories of the different chiefs, also, are so crossed and intermixed with each other, as to cause an exaction of hostages, tolls, and customs, almost at every step. These evils have been in some degree counteracted by a remarkably bold system of insurance, which undertakes to cover all these hardships and charges. The insurers maintain a large body of troops: and, by an understanding with the princes and those concerned in levying the duties, they make very considerable profits. The staple article of export is opium, to the extent of 6500 maunds, of which the price has lately been upwards of 60*l.* per maund; but this is ascribed to casual circumstances; and the future average is not expected to exceed 25*l.* Cloths of superior quality, produced at Chanderee and other places, have also been in request all over India; and though their fabric has been interrupted by recent anarchy, it is now expected to revive. Nemaar produces a valuable breed of black cattle. The principal imports are silks, chintzes, and other fine manufactures, with British woollens; which last, however, are used not as apparel, but for trappings and ornaments. These, being all articles of luxury, have been materially diminished by the poverty of the country; but may augment, if it shall continue to enjoy the blessings of peace.

4197. *Among the cities of Malwa*, the most ancient, and still the most important, is Oojein. It is situated about seventy miles north of the Nerbuddah, on the Sepra, a small river tributary to the Chumbul. Oojein holds a high rank among the sacred cities of the Puranas; and the Hindoo geographers have even fixed on it as their first meridian. Under the name of Ozene, it is mentioned as a great interior capital by Ptolemy and the author of the Periplus. The modern town stands at some distance from the old site, which was overwhelmed by a change in the channel of the river. Of late years it derived great additional lustre from being chosen by Scindia for his capital; and its circuit of six miles was filled with a crowded population; but he has now quitted it for Gwalior. A large proportion consists of Mahometans, who have built four handsome mosques. *Indore*, the capital of the Holkars, is a modern place, raised from a village by the Princess Alia Bhye, the most illustrious ruler of that race. As a capital, it is still not of very great magnitude. *Dhar*, the ancient Dharanuggur, is a place of very great antiquity, and appears at one period to have been a most flourishing capital. Though not occupying above a fourth of its former site, it is still the residence of an independent rajah, Runchunder Picar, who reigns over a very fertile district, yielding him a revenue of 125,000 rupees. Nemaar, a rich pastoral district, composed of the valley of the Nerbuddah, has for its capital *Mheysir*, pleasantly situated on the right bank of the river, and raised to its present rank by Alia Bhye, who made it her residence, and adorned it with a number of beautiful temples. In the district of *Harrowtie*, bordering on Ajmeer, *Kotah* has been raised by its present rajah, Salim Singh, to be one of the most opulent and beautiful cities of Malwa. The conduct of this prince, at once prudent and vigorous, has rescued him and his people from all the calamities and wars which have lately desolated central India, and has converted his little principality into the most effective and flourishing of its states. He maintains a well disciplined army of 25,000 men, and enjoys a revenue of 4,700,000 rupees. Near Kotah, at Barolli and Jhalrapatun, Colonel Tod discovered temples, which, in the beautiful profusion of sculptured ornaments, surpass those found in any other part of India. Jhalrapatun has become a great seat of inland trade. Bhopal, a town situated on a lake upon the immediate frontier of Gundwana, is the capital of a rajah, who reigns over an uneven, jungly, but in many places fertile tract. This prince, after suffering severely from an unequal contest with Scindia, has had his power and territory augmented by the friendship of Britain. He now maintains an army of 6000 troops, with 180 guns, and draws a revenue of 900,000 rupees. *Rath* is the name given to a wild, hilly, and wooded district bordering on Guzerat. It is occupied by Bheels, and a number of petty predatory princes, who has each his little capital; but it contains no city of magnitude. *Bagur* and *Kantul* are districts of similar character, continued along the frontier of Ajmeer. This range of territory conceals many beautiful valleys, and presents also numerous monuments of antiquity, of which the most remarkable are the excavated temples near the town of Baug, in Rath. A few remains, covered with jungle and crumbling to pieces, alone survive of the glory of *Mandoo*, which, raised by Mahommed Khiljee, during the period of the greatest prosperity of Malwa, attained a magnificence never equalled by any other capital of central India. Like Babylon, it seems to have been rather a fortified district than a mere city; being thirty-seven miles in circumference, and enclosing 12,650 acres. It occupied the crest of the Vindhya mountains, and was enclosed on all sides by a rugged natural ravine, which a strong interior wall rendered almost inaccessible to Indian attack. Nothing is left of this noble city but a small fort, frequented by religious mendicants, and some fragments of tombs and palaces, sufficient, however, to attest its departed grandeur. The ancient city of Woon, in Malwa, is distinguished by some very splendid architectural remains.

4198. *After passing the Nerbuddah* commences the division of India called *the Deccan*, a large expanse of territory, filling all the broadest part of that triangular peninsula which has its vertex at Cape Comorin, while its base is formed by the Nerbuddah, and by a line continued from that river to the mouths of the Ganges. This region, with the exception of the sea-coast, from which it is separated by the Ghauts, composes a table-land of some elevation, though inferior to Malwa on one side, and to Mysore on the other. It thus enjoys a happier climate, and displays more brilliant vegetation, than can be attained without inundation, on the level plains of the tropic. The Deccan is watered by two rivers, second, indeed, to those of Hindostan Proper, but still great and sacred streams: the *Kistna* and the *Godavery*, which both rise in the Western Ghauts, and flow across the entire breadth of the peninsula. The former, bearing the name of one of the most popular Hindoo deities, has a course of about 650 miles, the latter of about 850. The Deccan, separated from Hindostan Proper by a considerable space, and by strong natural barriers, was never reduced by foreign invaders to nearly the same entire subjection. The Mogul empire, in its greatest energy, scarcely held Viziapoor and Golconda as more than tributaries. As soon as the strength of that empire was shaken, the Mahrattas severed from it the principal Deccanee provinces, and pursued beyond those boundaries their career of conquest and ravage.

4199. *Candeish, or Khandeish*, a long narrow province, extending along the southern bank of the Nerbuddah, is, perhaps, the strongest military country in the world. It is entirely studded with that species of fortress, seemingly formed by nature to be absolutely impregnable. Solitary hills, composed of surrounding perpendicular walls of rock, with a plain on their summit, require only slight artificial defences to become impregnable alike to sap, artillery, and assault; and yield only to the influence of panic or famine. In the last campaign, before the war of sieges began, the spirit of the confederacy was entirely broken by the total rout of the Holkar forces at Mehidpore; and the different killedars or governors sought little more than to make a decent show of resistance. Though Candeish has a surface thus diversified, it is not, generally, a mountainous territory; many parts of it are capable of high cultivation, and, notwithstanding the late scenes of war and devastation, are rendered surprisingly productive. Besides the bounding stream of the Nerbuddah, this province is traversed by the Taptee or Tuptee, which, falling into the sea at Surat, after a course of 500 miles, would afford, in peaceable times, ample facilities for commerce.

4200. *The most important among the forts of Candeish*, and the centre of the strength of Scindia, is *Asscerghur*. A perpendicular rock, of the kind common in this part of India, rises above its surrounding bed of small hills. On one side, indeed, it is almost accessible; and there it is defended by two retaining walls, which form, however, an imperfect substitute for the natural rocky barrier. In the last war, neither the supplies nor the defences were found to answer expectation. The vicinity consists of wild ravine and jungle, dreadfully infested with tigers. *Malligawm* is on the frontier of Aurungabad, to which some consider it as belonging; but the narrator of the late Indian campaign considers it as the key of Candeish, and reports an Indian proverb, "Get but possession of Malligawm, and you have Candeish by the nose." It is a solitary hill, in the midst of a rich, extensive, and completely level plain; but its strength seems less due to natural position, than to its lofty walls, the succession of exterior works, and of six strong gateways, which bar the approach. It stood a month's hard siege by the British in the last campaign. If Malligawm owes so much to art, nature has done all for the splendid fortress of Unkie Tunkie. A more complete specimen of natural fortification seems scarcely to exist. On every side the perpendicular wall rises to the height of 150 to 200 feet, enclosing on the top a level plain of a mile in circuit. The ascent is by flights of steps cut in the solid rock, secured by the strongest possible gateways. It has copious magazines, granaries, armouries, all hewn out of the rock, and thus setting bombardment at defiance. It was only, therefore, through the determination of the rajah to abandon a sinking cause, that the attack of the British, on the 5th of April, 1818, was immediately successful, and their flag was seen "waving on the lofty and beautiful battlements of Unkie." Trimbuck, on a larger scale, is a tremendous and wonderful hill fort, impregnable to any army or artillery, however numerous. It measures ten miles round its base, and about four round its upper surface. The ascent is by a flight of 200 almost perpendicular steps; but it is impossible, without danger, to look back on the perilous steep of 600 or 700 feet beneath. From the top of this hill descends, falling drop by drop, the rill which forms the source of the great Godavery. In crossing the Tuptee, our troops almost unexpectedly came upon *Talnair*, which defends its passage, and owes its chief strength to the being surrounded on all sides either by the river or a deep ravine. Boorhanpoor, formerly the capital of Candeish, is still a large city, strengthened by a fort which, however, has never made any formidable resistance. The city is distinguished chiefly by being the head-quarters of a Mahometan sect called Bohrahs, whose habits are very commercial, and of whom 6000 reside in Surat.

4201. Directly south from Candeish, and forming the western part of the Deccan, stretch the large provinces of *Aurungabad* and *Bejapoor*, containing the original seats of Mahratta power. They present a great similarity in their general aspect; the surface being rugged, irregular, and among the western Ghauts even mountainous. These provinces are watered by the upper streams of the Kistna and the Godavery, not yet become rivers of the first magnitude. The soil is in some parts dry and rugged, but in many is capable of the highest culture. It supports, accordingly, a population which, though not supposed equal to what it is capable of maintaining, is estimated, in Aurungabad at 6,000,000, and in Bejapoor at 7,000,000. These two provinces are strong in a military sense; containing many natural fortresses, though neither so numerous nor so complete as those of Candeish. They have never been subject, for any length of time, to the general government of Hindostan. Even after the reduction of the native governments, Adil Shah, in 1489, founded the kingdom of *Bejapoor*, or, as it was called in Europe, *Viziapoor*, which held high sway over the Deccan, till the year 1689, when it yielded to the arms of Aurengzebe. Scarcely, however, had this conquest been completed, when the Mahratta power arose, which disputed the conquests of that emperor, and soon drove his feeble successors from all this part of India. Poonah then became the residence of the Peishwa, and the chief nominal seat of Mahratta sovereignty; though the success of the rebel houses of Scindia and Holkar transferred the real seat of that power to the more northern provinces.

4202. *Poonah*, thus become metropolitan among the Mahratta cities, is, however, by no means the most splendid. None of its sovereigns possessed that peaceful wealth which could enable them to indulge the Oriental taste for costly architecture. It seems to have been originally destined rather for a camp than a city; and in the great assemblages of the Mahratta confederacy, nearly 500,000 have mustered in and around it. The fixed population does not exceed 100,000. It resembles a huge village rather than a city; the houses are irregularly built, chiefly of slight brick walls, by which even the palace is entirely enclosed. For resisting the violent rains, these structures depend chiefly on interior timber frames: they are painted with innumerable representations of the Hindoo Pantheon. The markets are plentifully supplied with provisions of every kind. Poonah is now included in the British territory, and attached to the presidency of Bombay. Sattarah, a hill fort, about fifty miles to the south, after being long the state prison of the hereditary rajahs, became the nominal capital, since Britain deposed the Peishwa, and restored the ancient head of the confederacy to some degree of power; but, as this sway is limited, Sattarah will not probably rise to the rank of a great city.

4203. *A very different degree of magnificence* is perceptible in the remains of the ancient capital of *Viziapoor*. The fort is, perhaps, the largest in the world, being eight miles in circumference, and containing numerous gardens, mosques, and palaces. The great mosque of Adil Shah, which cost 700,000*l.*, and occupied 6500 men for thirty-seven years, is still in tolerable preservation. The fort with the city, separated from it by a large plain, now presents a district covered by ruins, interspersed with several detached towns, the population of which has not been estimated. *Aurungabad* and *Dowlatabad* form two great ancient capitals, almost contiguous to each other. The latter, originally called Deoghiri, is the most ancient; and in the fourteenth century Mahomet III. made extraordinary efforts to render it the general capital of Hindostan. It is very strongly situated on the side of a hill, and, being well fortified, is considered as the key of the Deccan. Till the Mogul conquest, it gave name to the province, but Aurengzebe conferred the former appellation (*Aurungabad*) on the neighbouring village of Gurka, which he soon made the capital of the Deccan. Both cities are still populous, and contain vestiges of ancient grandeur. At present, they form part of the dominions of the

Nizam. Ahmednaggur, once the capital of another powerful dynasty, and still a considerable city, is now included in the British territory.

4204. Near Dowlatabad are found the wonders of *Ellora*, perhaps the most extensive and surprising monument of ancient Hindoo architecture. They consist of an entire hill, excavated into a range of highly-sculptured and ornamented temples. "The number and magnificence of the subterraneous temples," says Mr. Erskine; "the extent and loftiness of some, the endless diversity of sculpture in others, the variety of curious foliage, of minute tracery, highly wrought pillars, rich mythological designs, sacred shrines and colossal statues, astonish but distract the mind." It appeared truly wonderful "that such prodigious efforts of labour and skill should remain, from times certainly not barbarous, without a trace to tell us the hand by which they were designed, or the populous and powerful nation by which they were completed." The courts of Indra, of Juggernaut, of Parasu Rama, the Doomar Leyna, or nuptial palace, are the names given to several of these grand excavations. But the greatest admiration has been excited by the one called *Keylas*, or paradise, consisting of a conical edifice separated from the rest, and hewn out of the solid rock, 100 feet high, and upwards of 500 feet in circumference, and entirely covered with mythological sculptures.

4205. *The interior of the Deccan*, to the eastward, comprising the provinces of *Hydrabad*, *Nandere*, *Beeder*, and the greater part of *Berar*, composes a large surviving fragment of the Mogul empire, under the government of the Nizam. This officer, at first a mere viceroy, took advantage, like others, of the downfall of the empire, to assume independence. Having connected himself by alliance with Britain, he was enriched with the spoils of the Mahratta empire, and finally obtained a territory extending upwards of 400 miles in length by 200 in breadth, and containing more than 8,000,000 inhabitants. Though allowed, however, to carry on the internal government, he is kept in a state of entire dependence as to all his foreign relations; and a subsidiary, or, more properly, a ruling force is constantly stationed in his capital. So irksome, it is suspected, does the Nizam feel this protection, that he was strongly inclined, in the last war, to join the Mahratta confederacy; but, if he entertained any such intention, the rapid success of the British arms deterred him from open hostilities. The whole of this territory is a table-land, diversified by hills considerably less lofty than those of the Western Deccan. It has many fertile spots, particularly in the small province of *Nandere*, extending along the Godavery, and in the most southerly one of *Beeder*. It benefits little by its exemption from foreign internal sway, being one of the most oppressed and misgoverned districts in India, without wealth or population adequate to its natural resources. It has no flourishing manufactures, and the import of European goods is not supposed to exceed the annual value of 25,000*l*.

4206. *Hydrabad*, capital of the province of the same name, may be considered also the present capital of the Deccan, the removal of the Nizam thither from Aurungabad having attracted to it a population of about 120,000. It is seven miles in circumference, surrounded by a wall, not sufficiently strong, however, to convert it into a military position. Though not a fine city, *Hydrabad* contains some handsome mosques; and the Nizam maintains, on a smaller scale, a semblance of Mogul pomp. He has large magazines filled to the ceiling with fine cloths, watches, porcelain, and other ornamental articles presented to him by European embassies.

4207. *About six miles from Hydrabad is Golconda*, formerly the capital of a kingdom which has a splendid name in Europe, from its diamond mines in the subject district in *Gundwana*. It is situated on a high rock, so strong by nature and art that it is believed by the natives to be impregnable. No European has ever been admitted. The vicinity is adorned with a number of splendid tombs. *Warangol*, about fifty miles from *Hydrabad*, presents only the ruins of the ancient metropolis of *Telingana*, when that name, now only applied to a language, designated a large extent of eastern and central India. *Nandere* and *Beeder*, capitals of their respective provinces, are both fortified towns, but not of remarkable extent. Of *Beeder* it has been remarked, that in its vicinity are spoken the three languages of the east, west, and south; the *Telinga*, the *Mahratta*, and *Canara*. The most northerly part of the territories of the Nizam consists of that largest part of *Berar*, of which *Ellichpoor* is the capital. This province is high, rude, and in general imperfectly cultivated, though its bullocks are reckoned the best in Hindostan.

4208. *The eastern portion of Berar*, with the greater part of the rugged border province of *Gundwana*, forms the domain of the rajah of Nagpoor, or of *Berar*, chief of what are called the Eastern Mahrattas. Ragojee Bhoonslah, the founder of this dynasty, boasts a higher descent than the Peishwa, though he began his career only as an officer under that personage. In 1803, he joined Scindia against Britain; but the signal successes gained by General Wellesley obliged him to consent to a treaty, by which he ceded the district of *Cuttack* in *Orissa*, and a great part of *Berar*. In 1817, the rajah, Appa Sahib, at the commencement of the campaign, lulled the British into security by lavish professions of fidelity; but on the 27th of November the Arabs in his service made a sudden attack on their corps stationed at Nagpoor, and it was not without great loss that they were repulsed, and obliged to quit the place. The rajah then offered a semblance of submission; but soon after seized an opportunity of escaping, and joining the enemy. The issue of the campaign converted him into an exile and a fugitive. The British placed on the throne his son, a youth; but arranged that all affairs should be carried on by a regency, the leading member of which was their own resident. *Nagpoor*, chief among the cities of the rajah, raised from a village by Ragojee Bhoonslah, contains about 80,000 inhabitants, but is meanly built, and possesses no great strength as a fortress. The bulwark of the territory is considered to be *Gawilghur*, in *Berar*. This stronghold, consisting of an outer and an inner fort, is built on a high rocky hill, and was regarded by the natives as impregnable, till 1803, when it yielded in a few days to the army of General Wellesley.

4209. *Gundwana*, with a few exceptions, is the poorest and rudest province of Hindostan. It is mountainous, ill-watered, covered with jungle, and thinly inhabited; it was consequently almost neglected by the Mogul potentates, and left to the Goands, its almost savage native possessors. When the Mahrattas however established a government at Nagpoor, they took possession of all the parts that were at all valuable or cultivated, and the Goands were driven into the highest and most inaccessible tracts, from whence they descend only for the purposes of plunder.

4210. *Orissa*, to the east of *Gundwana*, occupies the whole sea-coast of the Deccan, from the Carnatic to Bengal. The interior, traversed by a portion of the great chain of the Ghauts, is still more rugged than *Gundwana*: it is marshy, covered with jungle, and infested by a dangerous malady called the hill fever. The *Oureas*, a tribe of fierce and rude natives, inhabit these wild recesses, and render themselves formidable to the Mahrattas; but the influence of British law has converted them into peaceable subjects. The three great rivers, the *Mahanuddy*, *Godavery*, and *Kistna*, discharge themselves into the sea; the first at the northern, and the two latter at the southern extremity of this province.

4211. *The Circars, comprising that part of Orissa* which is situated between the Ghauts and the sea, is of quite a different character from the interior regions now described: it is indeed one of the most valuable districts in Hindostan; equal to the Carnatic in fertility, and superior in manufacturing industry. It is remarkable, also, as being the first territory of any considerable extent which came under the dominion of the East India Company. The French, in 1759, having been driven from *Masulipatam*, Lord Clive obtained from the Mogul the grant of the territory; and the Nizam, though then in actual possession, was not in a condition to dispute the transaction. The internal government has not been materially altered, the villages being ruled according to their ancient institutions; but the power of the zemindar, who, at the first occupation, could assemble 41,000 troops, has been greatly broken. Calicoes and chintzes are the staple manufacture, the finest of which are produced on the island of *Nagur*, forming the delta of the *Godavery*. These manufactures are exported to Europe and various parts of the East, but particularly to *Persia*, where the demand for them is most extensive. The *Circars* are five in number; *Guntoor*, *Condapilly*, *Ellore*, *Rajamundry*, and *Cicacole*: *Masulipatam* has lately been considered as forming a sixth.

4212. *The important trade of this district* centres almost entirely in *Masulipatam*, a large sea-port, with the

best harbour in the whole coast from Cape Comorin. More than half of its exports are to Bassora, the rest chiefly to Madras, which it supplies with a considerable quantity of grain.

4213. *Cuttack*, traversed by the lower Mahanuddy, forms an extensive district, connecting the Circars with Bengal. It is in many parts fertile, with some flourishing manufactures; and it supports a population of 1,200,000 people. Cuttack, the capital, situated on a broad channel of the Mahanuddy, is a town of importance. But the most remarkable district and place is in the holy land of Juggernaut, which comprises a circuit of fifteen miles, and has already been described as the strange and horrible scene of Indian fanaticism and idolatry.

4214. *In surveying the Western Deccan*, we purposely reserved *the coast*, which displays a character quite different from the interior. It contains one grand feature, *Bombay* (fig. 630.),

BOMBAY.

the western capital of British India. This city is situated on a small island connected by an artificial causeway with the larger one of Salsette. It commands a beautiful view over a bay, diversified with rocky islets, and crowned by a background of lofty and picturesque hills. Tanna, in Salsette, was the original settlement of the Portuguese. Attracted by the fine harbour of Bombay, they erected a small fort there; but none of their establishments on this coast were allowed to rival Goa. In 1661, Bombay was ceded to Charles II., as part

of Queen Catherine's portion; two or three years after, a settlement was established, and in 1686 the chief seat of English trade was transferred thither from Surat. Since that time, Bombay, notwithstanding considerable vicissitudes, has continued on the whole in a state of constant increase, and has become the great emporium of western India, with a population of 220,000. Of these, about 8000 are Parsees, the most wealthy of the inhabitants, and by whom its prosperity is mainly supported. There are also Jews, Mahometans, and Portuguese in considerable numbers; but the Hindoos comprise three fourths of the whole. The presidency of Bombay is not of the same extent with those on the eastern side of the empire, being closely hemmed in by the great holds of Mahratta power in the Deccan. It includes, however, Surat, Baroach, and the finest districts of Guzerat; and thus comprehends a population of about 2,500,000. Bombay has a governor and council, subordinate to the supreme government at Calcutta. It contains also a court of judicature, administered by a single judge, with the title of Recorder. The number of civil servants in the establishment amounted, in 1811, to seventy-four, and the appointments of the whole civil service to 174,238*l*. A literary society has been established at Bombay, chiefly with a view of exploring the learning, history, and antiquities of India. The commerce direct with Britain is not so extensive as that of the other two presidencies, the adjacent territory affording few of the staple Indian commodities. The exports, not exceeding 200,000*l*., consist chiefly of miscellaneous articles, collected from different parts of India. The Concan and Guzerat supply it with grain and provisions, and the latter with fine manufactures, which are re-exported to every part of the East. Pepper and other spices are drawn from Canara, and raw silk in large quantity from Bengal. The communication with China is extensive, that empire furnishing many articles suited to the consumption of the natives, and receiving a large supply of opium. The intercourse with Cutch, Sindh, and the Persian Gulf is also considerable. The total imports, in 1811-12, amounted to 16,970,000 rupees, and the exports to 14,550,000.

4215. *The vicinity of Bombay* is distinguished by the most ancient and remarkable of the religious structures formed by the Hindoos. The most celebrated is that of Elephanta (fig. 631.), on a small adjoining island of the same name. It is situated about three

ELEPHANTA.

quarters of a mile up the side of a mountain, from the rocks of which it is entirely excavated. The entry is by four rows of massive columns, forming three magnificent avenues. The interior is 220 feet long by 150 broad, but little more than fifteen feet in height. The most remarkable object consists in three colossal heads, which have been supposed to be those of the Hindoo Trinity;

but it seems now agreed that they are only different representations of Siva.

4216. *The caves of Kenneri*, on the larger island of Salsette; and those of Carli, on the

opposite shore of the continent, present phenomena almost equally striking. The mountain of Kenneri, according to Mr. Forbes, appears to have had a city hewn in its rocky

632

EXCAVATED MOUNTAIN OF KENNERI.

appellation of the "coast of the pirates," which has close of the seventeenth century, Angria, a piratical chief, established there an extensive power, which

633

INTERIOR OF TEMPLE.

yielded, however, in 1756, to the united arms of the British and the Mah-rattas. The territory was at first annexed to that of the Poonah Mah-rattas; but it is now, with the exception of a small portion, subject to the Rajah of Colapoor, and almost wholly under British control.

4218. *Goa*, at the southern extremity of the Concan, having been captured by the Portuguese in 1510, became their principal settlement, and was long the European capital of India. Even in its present utter decay, it retains traces of its early magnificence. The cathedral, and the convent of the Augustines, are superior to any other specimens of European, and perhaps of native, architecture in India. It retains an air of gloomy monastic grandeur. A territory of forty miles in length, and twenty in breadth, is still de-

SUBJECT. 4. *The South of India.*

4219. *In passing the confines of Viziapoor and the Concan, we leave all that ever constituted part of the Mogul empire, or at least was regularly apportioned among its provinces. The south of India, reaching from this point to Cape Comorin, is divided into a number of little kingdoms, always independent, until they were absorbed under the dominion of Britain.*

4220. We shall begin with the maritime tract of *Malabar*. This name properly belongs to a small kingdom, of which the capital, Calicut, was found by the first Portuguese navigators to be the seat of a most ample dominion, under a sovereign called the Zamorin. Hence Malabar has extended its name to the whole of the tract in question, and has even been applied loosely to all the western coast of the peninsula, as far as the Gulf of Cambay. Considered as the coast reaching from the Concan to Cape Comorin, it forms a region 500 miles in length, thirty or forty in breadth, interposed between the Indian Ocean and the almost continuous chain of the Western Ghauts. This position supplies it with copious moisture. Its surface, rugged, rocky, and irregular, may be rendered highly productive with careful cultivation, which is generally bestowed. It yields very large crops of rice, forming an article of export to Bombay and the northern coasts. But the staple of its European commerce is pepper, produced in greater abundance and perfection than in any other part of the globe. It produces, also, very copiously, the noted Indian luxury of the betel leaf and areca nut; likewise ginger, cardamoms, and several other spices. The upper districts abound with fine timber, particularly the teak, so pre-eminently valuable for ship-building; also sandal, sapan, and other dyeing and ornamental woods. The region does not contain any fine or flourishing manufactures; but with its grain, timber, and spices, purchases the fine cottons of Guzerat.

4221. *Social life throughout Malabar, presents a varied and often very peculiar aspect. The original structure of Hindoo society has not been altered by foreign conquests, though varied*

by some casual migrations ; but it has assumed within itself some forms decidedly in contrast with those which it elsewhere exhibits. The tyrannical prejudices of *caste* are carried to a more violent and inhuman pitch than even in the rest of India. If a cultivator (*tiar*) or fisherman (*mucua*) presume to touch one of the *nairs*, or military class, the *nair* is considered fully justified in killing him on the spot. The same fate befalls the *paria* who ventures even to look him in the face, and does not, on seeing him at a distance, instantly take flight. This last race are all slaves ; a condition not common in the rest of Hindostan. But there is another class of sufferers, whom a barbarous pride has stripped beyond any other of the most common rights of humanity. The *niadis* are excluded from all human intercourse, forced to wander in unfrequented places, without any means of support, except the alms of passengers. These they endeavour to attract, by standing at a little distance from the public road, and " howling like hungry dogs," till the charitable wayfarer lays on the ground some donation, which, after his departure, they hastily carry off.

4222. While these unhappy races are kept in the lowest misery, the *nairs*, or *nobles*, revel in extravagant pomp and gaiety. This remarkable body are, in the Hindoo system, classed as *sudras*, though they rank immediately under the *brahmins*, the intermediate classes being here wanting. Indeed, they are manifestly equal in dignity with the *cshatryas* of North-western Hindostan. Their most peculiar but least honourable characteristic consists in the arrangements with regard to the *nair* females. For them a system of the most shameless profligacy is marked out, and enforced even by sacred sanctions. They are married at ten years of age, and have an aliment transmitted to them by their husband, whom they must not, however, see, or hold any intercourse with : a single instance of such connection would be considered scandalous. They reside with their mother, and, after her death, with their brother ; and they are allowed, and regard it an honour, to attract as many lovers as possible, provided they be of equal or superior rank. It is thus considered a ridiculous question to ask a *nair* who is his father. The only real parentage rests with the brother of the wife, whose children are considered as belonging to him, and to whom all his property and titles are transmitted.

4223. A striking peculiarity, on the Malabar coast, consists in the early colonies of Christians and Jews, which still form a considerable part of its population. So numerous are the former, as to give Malabar, in many quarters, the appearance of a Christian country : they are computed, on the whole, at from 100,000 to 150,000. They derive from a somewhat doubtful tradition the title of Christians of St. Thomas ; yet their origin really does not appear to be much later than the apostolic age. Their original form of worship was simple and primitive ; but the Portuguese, who, at an early period became masters of this coast, considering such worship as heresy, began a violent persecution, by which these poor people were at length obliged to admit into their churches saints and images, to embrace the doctrines of purgatory and transubstantiation, and to treat the marriage of priests as unlawful. They could not, however, be induced to hear the service read in Latin : the Portuguese were obliged to concede this point, and allow the use of the Syriac. A sort of Syro-Roman church was thus formed ; but Dr. Claudius Buchanan, on penetrating into the interior of Travancore, discovered a body of these Christians in their original simplicity. The intelligence of the people, the virtuous liberty of the female sex, and the whole aspect of society, seemed to indicate a protestant country. They were poor, having suffered much from the Portuguese, but now enjoy almost entire toleration.

4224. The Jews of Malabar, who amount to about 30,000, are divided into *White* and *Black*, forming quite distinct classes ; the white considering the other as comparatively low and impure. They are supposed to have arrived not very long after the destruction of Jerusalem ; and in 490 obtained the gift of the city of Cranganore ; but, having incurred the hostility of a neighbouring potentate, this settlement was broken up and dispersed. The black Jews have been supposed by some to be Hindoo converts ; but Dr. Buchanan rather imagines them to be of an earlier race, who emigrated at the time of the Babylonish captivity. Both tribes have Hebrew manuscripts of the Old Testament, which appear to be preserved in a state of tolerable purity.

4225. In surveying this coast in detail, we begin with *Canara*, which extends along the sea about 200 miles. The northern part is very hilly, and produces chiefly teak wood ; but the southern, called by the natives *Tulava*, is well cultivated, and exports large quantities of rice. The former contains about 7000, the latter about 80,000 houses ; and we may reckon about five inhabitants to each house. Hindoos of that peculiar sect called the *Jains* abound in the country. There are also a considerable number of Christians ; but the sea-coast is chiefly possessed by a class of Mahometans called *Moplays*, apparently emigrants from Arabia. Through their means, Hyder and Tippoo were complete masters of *Canara*, and the latter carried on a violent persecution against the professors of all other religions. After his fall, however, *Canara*, in 1799, was annexed to the British dominion, and toleration was restored.

4226. The principal city of *Canara* is *Mangalore*, long a flourishing emporium. It suffered in the war between the Mysore sovereigns and the British government. Being taken by the British in 1783, it was defended with extraordinary valour against the whole force of Tippoo. In the following year, it was surrendered by treaty to that prince, who then dismantled the fortifications. Since coming under British dominion, *Mangalore* has flourished, and carries on a very great export of rice. It is situated on a peninsula formed by a very beautiful arm of the sea, and on the bank of a considerable river. The port will not admit vessels drawing more than ten feet water ; but the anchorage at the mouth of the river is good. *Onore*, *Carwar*, and *Barcelore* were deprived, by the devastations of Tippoo, of the great trade they once possessed, but are reviving under British auspices.

4227. *Proceeding southwards*, the next district is that of *Malabar Proper*, which occupies about 200 miles of coast, and contains upwards of 600,000 inhabitants. The soil immediately along the shore is poor and sandy; but in the interior it consists of hills, the sides of which are formed into terraces, with fertile valleys interposed. Pepper, abundantly raised in the hill-forests of this country, forms the staple of a very extensive foreign trade. Calicut, which first gave to De Gama an idea of the splendour of Indian cities, was the residence of the Zamorin, whose empire then extended wide along Malabar. Its power was materially broken by unsuccessful contest with the Portuguese; and, towards the close of the last century, was finally destroyed by the invasions of Hyder and Tippoo. In the struggle which terminated in the downfall of the latter, Britain derived some aid from the native chiefs, who in return were invested with the internal jurisdiction of the country, subject to the payment of a regular tribute. Between powers placed in so delicate a relation, dissensions were not long of arising; and conflicts ensued, which terminated in favour of the British, who assumed the uncontrolled dominion of this country, its territory being annexed to the Madras presidency. The Zamorin, like the Mogul, is now a stipendiary of our Indian government.

4228. *Calicut*, the once proud capital of Malabar, was entirely destroyed by Tippoo; but, as soon as British ascendancy permitted, the inhabitants, animated by that local attachment which is strong in India, hastened to return. It is now supposed to contain from 20,000 to 30,000 inhabitants, and has an improving trade. The most remarkable modern city, however, has been Cananore, the seat of a great female potentate called the Biby; and, from its almost impregnable position, regarded as the main hold of the Moplays or Mahometans of Malabar. The Biby is still allowed to administer Cananore and the fine country in its immediate vicinity. She carries on also considerable mercantile transactions with Bengal and Arabia, and includes in her sovereignty the Laccadives, an archipelago of low shoaly islets, facing the coast of Malabar, at the distance of from seventy-five to 150 miles. They, however, produce nothing but betel and plantains, and are inhabited by poor Moplay fishermen. Tellichery, long the principal English settlement and seat of trade, still contains many rich merchants, and a polished society: but since the capture, in 1793, of Mahé, then the principal French settlement, the preference has been given to that place, which has the advantage of a particularly fine situation.

4229. *South of Malabar Proper* is the small province of *Cochin*, which presents the same general aspect as the rest of the coast, and particularly abounds in teak timber, though the finest trees have now been cut, without any care to renew them. The Jewish and Christian colonies are particularly numerous in this territory. Cochin, the capital, was the first point at which the Portuguese were allowed to erect a fort. In 1663, it was taken by the Dutch, and was rendered by them one of the most flourishing cities of India. The rajah has maintained his independence better than most Hindoo princes. He was merely tributary to Tippoo, and is allowed even by Britain to carry on the internal affairs of his state, though under payment of a heavy tribute. Cochin still enjoys a considerable trade. Ten miles to the north is Cranganore, which the Portuguese have made the seat of a bishop's see, holding authority over eighty-nine churches.

4230. *The extended line of coast* from Cochin to Cape Comorin is filled by the dominions of the Rajah of *Travancore*. They contain a population of about 2,000,000, and possess all the advantages peculiar to the Malabar coast. The inland districts, in particular, are remarkable for fertility and beauty. They exhibit a varied scene, consisting of hills clothed with lofty forests; and of winding streams, with valleys clad in perpetual verdure. The woods are perfumed with numberless aromatic plants. Besides the staple article of pepper, Travancore yields ginger, turmeric, and inferior species of nutmeg and cinnamon. The rajah, like that of Cochin, conducts the internal affairs of his dominions, but on a footing completely subject and tributary to the Company. An attempt made in 1809 to shake off this yoke only riveted his chains the closer. *Travancore*, the ancient capital, is situated somewhat up the country, in a soil of white sand; but it is much decayed since the rajah removed to a new palace, built on the European model, at Trivandapatam. Trivander, Coulan, Anjengo, and Coleshy, afford convenient havens for trade, though the strong currents which run along the coast render navigation difficult.

4231. *At the extreme point of the territory of Travancore is situated Cape Comorin*, the southern boundary of India; a bold and commanding feature, which presents to the ocean a lofty hill covered with the most brilliant verdure; but the rocks scattered along the shore render it necessary for the navigator to keep at a distance.

4232. After turning Cape Comorin, we find ourselves in that extensive territory, to which Europeans have given the name of *Carnatic*. It stretches about 500 miles along the coast, as far as Montapilly, thus stopping somewhat short of the great natural boundary of the Kistna. It is divided into two parts by the chain of the *Eastern Ghauts*, running, like the Western, parallel to the coast. One of these divisions is called the *Carnatic above*, and the other the *Carnatic below*, the *Ghauts*; but the former is better known, and will be described, under the title of *Mysore*; and the territory on the coast will be here considered as the proper *Carnatic*. It is called also the coast of *Coromandel*; and, though in its general structure similar to Malabar, presents some marked differences. The mountains are distant from the sea fifty, seventy, or a hundred miles; and, instead of being clothed with vast and majestic woods, are in most places naked and rocky. The region is watered by several great rivers, rising in the western Ghauts, and running across the whole peninsula, among which the *Cavery* stands pre-eminent. Upon the whole, however, instead of numberless torrents dashing down the sides of the hills, and requiring only to be confined and guided, this tract contains large arid plains, to which the industrious husbandman can with difficulty, by canals and tanks, convey the necessary moisture. The Ghauts, also, from their great altitude, intercept the heavy rains which the monsoon brings on the western coast; and there are only occasional showers, from May to June, to fertilise the ground and cool the intensity of the heat. Hence the Carnatic, in seasons of drought, is subject to severer famines than any other part of India. Yet, though there are many barren tracts, the country, on the whole, is highly cultivated, and very productive.

4233. *The population of the Carnatic is estimated at 5,000,000*; of which a peculiarly large proportion consists of native Hindoos. The tide of Mahometan conquest did not reach it before the fourteenth century; nor was the subjection nearly complete until the reign of Aurengzebe. A race of Mogul viceroys was then established at Arcot, who, on the fall of the empire, set up an independent power. Pressed, however, by the overwhelming force of the sovereigns of Mysore, they were forced to implore British aid. The Company readily interposed, and, after a long and desperate struggle, subverted the throne of Hyder and Tippoo. The Nabob, however, then found, that he was entirely at the mercy of his defenders; and his attempts to extricate himself from this dependence afforded them ground for proceeding to farther extremities. On the death of the reigning Nabob in 1801, his successor was compelled to sign a treaty by which the sovereignty of all his territories was transferred to the Company: and there was reserved to himself only from two to three lacs of pagodas, and a portion of household lands. The country was then divided into eight districts or collectorships, administered by British officers. Arcot and its immediate vicinity is chiefly peopled by Mussulmans; and on the southern part of the coast there are emigrants from Arabia, though not in nearly so great numbers as on the Malabar coast. The rest of the population is Hindoo, and the customs and religion of this native race have been preserved here in unusual purity. The pagodas are extremely numerous, and rival in splendour those of the sacred cities of Benares and Allahabad. The Brahmins, not generally oppressed, as elsewhere under Mahometan ascendancy, had intrusted to them most of the civil employments in the state and revenue. Another class, almost peculiar to this district, is that of the *Polygars*. Originally district officers of the British government, they took advantage of its periods of weakness, and erected castles, from which, like too many of the baronial chiefs in the feudal ages, they plundered and oppressed the surrounding country. Government were often obliged to purchase their orderly behaviour by giving them an independent power and jurisdiction. There is no class whose subjection proved so expensive to Britain. The Carnatic is much more of a manufacturing country than Malabar; yet it does

not produce those fine fabrics which distinguish Bengal and the Circars. Piece goods, blue cloths, chintzes, &c., all of a coarser kind, are its principal product.

4234. *Our detailed survey of the Carnatic* must begin with *Madras*, now its capital, and that of the British possessions on the eastern coast. The choice, as in many other countries, has not been so happy as that made by the French; Pondicherry being every way a finer and more convenient station. Madras has no harbour; but a mere road, through which runs a strong current, and which is often exposed to dangerous winds. On the beach breaks so strong and continual a surf, that only a peculiar species of large light boats, the thin planks of which are sewed together with the tough grass of the country, can, by the dexterous management of the natives, be rowed across it. For the conveyance, also, of letters and messages, they employ what is called a *catamaran*, consisting merely of two planks fastened together, with which they encounter the roughest seas with wonderful address, and, when swept off by the waves, regain it by swimming. The sums, however, now invested in the various edifices of Madras as the capital of the presidency, are so great, that to transfer the seat of government to another place would be out of the question. Fort St. George, planned by Mr. Robins, a celebrated engineer, and placed at a small distance from the sea, is a strong and handsome fortress, not nearly on so great a scale as Fort William at Calcutta, but more advantageously situated, and defensible by a smaller number of men. The public offices and storehouses form a range of handsome buildings along the beach, their upper stories being adorned by colonnades resting on arched bases. With this exception, European Madras is merely an assemblage of country houses situated in the midst of gardens, and scattered over an extent of several miles. The houses consist usually only of one story, and are of a light and elegant structure, having porticoes and verandas supported by columns covered with that fine polished composition of shell limestone called *chunam*. The diligent hand of art has covered with verdure a somewhat arid and ungrateful soil; but fruits and flowers are still raised with some difficulty. The mode of living is nearly the same as at Calcutta, but on a more limited scale. The morning, from nine to eleven, is spent in calling and visiting; at two, a substantial meal, called *tiffin*, is taken; at five, when the air becomes more cool, the family usually drive out; and at seven or eight, a late dinner concludes the day. The Black Town is extensive, and the scene which it presents, of minarets and pagodas mixed with trees and gardens, is striking from a distance; but the interior, like that of most Asiatic towns, consists of poor bamboo cottages thatched with leaves. There are, however, some great native merchants, who have splendid mansions in the Oriental style. The commerce of Madras is not so extensive as that of the other two presidencies; piece goods from the Circars and the southern Carnatic forming the only considerable article.

4235. *In the vicinity of Madras is the district of Chingleput*, originally obtained as a jaghire from the Mogul, and still kept up as a distinct collectorship. Though the soil be generally dry, it is made by industry to yield tolerable crops of rice. The town of Chingleput is somewhat inland, and not of much importance. About thirty-five miles to the south of Madras is *Mahabalipoor*, or the city of the Great Bali, called also the Seven Pagodas. It consists of a range of sculptured edifices representing the exploits of Bali, Krishna, and other chiefs celebrated in the Mahabarat. It is sacred to Vishnu, a colossal image of whom is found in the principal temple. The monuments, though not on the same gigantic scale as in some other parts of India, are said to be very beautifully executed. In the interior of the country is Tripatti, one of the most crowded scenes of Hindoo pilgrimage; the ceremonies of which, however, Europeans, it is said, have never been admitted to view.

4236. Proceeding southwards, we arrive at *Pondicherry*, the seat of *French empire* in India. This empire, founded in 1749 by M. Dupleix, presented for some time a brilliant aspect, and, seconded by native alliances, threatened to subvert the foundations of the British power in the East. Although the French were, however, skilful in their negotiations with the native powers, their intolerant spirit led them to refuse to the people the free exercise of their religion, which must have rendered it next to impossible for them to hold any large territorial possessions. In fact, towards the close of the war of 1756, Pondicherry fell into the hands of the British; and, though restored by subsequent treaties, never, on the renewal of war, made any effectual resistance. Pondicherry was raised by the French from a village to be the handsomest European city in India. It contained many fine houses in the European style; and the high culture of the vicinity, the numerous canals crossed by neatly constructed bridges, the roads planted with trees, and partly adorned by statues, gave to the surrounding district the appearance of a great garden. The inhabitants have suffered much by repeated hostilities, and, being unfavourably situated for trade, have been unable to retrieve their affairs. In this last respect, Pondicherry is surpassed by *Cuddalore*, a well-built town, at the mouth of a considerable river. In war, it has followed the fortunes of Pondicherry; though its capture in 1783 was not effected without very great loss on the part of the British.

4237. *The kingdom of Tanjore* is an important territory, consisting of the delta of the Cavery, a large river, which, rising in the western Ghauts on the borders of Malabar, traverses Mysore, and falls into the sea, after a course of 400 miles. The Hindoos attach to its stream a peculiarly sacred character. At Trichinopoly, about 100 miles above the sea, it separates into two great branches, one retaining the original name, and another called Coleroon. Numerous channels derived from these convert the region into a delta, not surpassed by any part of Egypt or Bengal in culture and fertility. Art has been industriously employed to improve these natural advantages. Immense mounds have been erected, to prevent the tendency shown by the two channels at one place to reunite; and artificial canals convey to every quarter the benefits of irrigation. The chief produce consists of rice, grain, cocoa nuts, and indigo, which are largely exported. The population introduced by Mogul conquest has never reached Tanjore and the only Mahometans consist of

a few refugees from Arabia. This country, therefore, has retained, almost entire, the ancient religion, constitution, and manners of India. It is particularly distinguished by the splendour of its pagodas and other edifices destined to religious worship. Tanjore was governed by an independent rajah until 1799, when the British took advantage of their ascendancy to oblige him to resign the administration, accepting a revenue of a lack of rupees (10,000*l.*), with other allowances, somewhat exceeding that amount. He was also permitted, in time of peace only, to keep possession of the strong fortresses by which his capital is defended.

4258. *The city of Tanjore* may be considered as the native capital of Southern India, and the rival of Benares in learning, splendour, and antiquity. Its pagoda is greatly

celebrated, rising from the ground by twelve successive stages, and considered the finest specimen of that species of structure existing in India (*fig. 634.*). A college is also attached to it. The place is six miles in circumference, and contains two large and strong forts, the smallest of which is about a mile in circumference, surrounded with a broad and deep ditch, cut in the solid rock. In one of these forts is the pagoda, and in the other the palace of the rajah, who is allowed at present to garrison both.

634

PAGODA AT TANJORE.

4239. *Trichinopoly* is a large and strong city, farther up the Cavery, and distinguished by being the residence of Mohammed Ali and his son, who, under British auspices, reigned over the Carnatic. The siege of Trichinopoly, in 1755, is celebrated in Indian history for the gallant defence made by British officers against the French and their Indian allies, which terminated in a great part of the former being obliged to surrender. Opposite to Trichinopoly is the large island of Seringham, formed by the two branches of the river. It contains a pagoda pre-eminent in magnitude and sanctity, being about four miles in circumference, and surrounded by seven successive inclosures. The innermost shrine has never been violated by any hostile power. It is visited by crowds of penitents from all parts of Hindostan, who, in return for the pardon of their sins, bestow copious gifts; and the Brahmins attached to the temple are thus maintained in a state of luxurious ease.

4240. *Among the sea-ports* by which the commerce of the kingdom of Tanjore is carried on, we may mention Negapatam, at the mouth of the Cavery, once the chief factory of the Dutch on this coast, and made by them a very strong and commercial place: but it has declined in both these respects since it came under the power of Britain, and is now chiefly used as a place of refreshment. At the mouth of one of the deltaic branches is Tranquebar, which the steady and prudent conduct of the Danish government converted from a small village to a thriving mart of trade, now containing from 15,000 to 20,000 souls. It is also the seat of a very active mission, to which the public is indebted for some important memoirs relative to India. Devicotta, at the mouth of the Coleroon, is a considerable British factory, though the approach to the fort is somewhat dangerous.

4241. *The districts of Madura, Dindigul, and Tinnevely*, added to Travancore on the opposite coast, constitute the extreme south of India. They are inferior to Tanjore in natural fertility, and still more in cultivation.

They are less copiously watered, and a great part of their surface is covered with jungle, the rude retreat of Polygars, whose incursions disturbed all the pursuits of peaceful industry. It is reviving, however, under British protection. Cotton forms the staple product, particularly of Tinnevely; and a considerable quantity of coarse manufactures is transmitted to Madras. The capitals of the same name are not of particular magnitude or importance, and in their situation and structure strength was mainly studied; but since the country has attained a more settled state, their fortifications have fallen into decay. Madura is a very ancient city, and is regarded by the Hindoos as peculiarly sacred. It has a pagoda or temple much more than commensurate to the greatness of the city, and one of the most splendid in southern India (*fig. 635.*).

635

HINDOO TEMPLE AT MADURA.

4242. *The northern part of the Carnatic* still remains to be mentioned: it is generally inferior to the southern, and yields no remarkable product, either of land or manufacture. Arcot, nearly in a direct line inland from Madras, was raised to high importance by the Mogul government, who, attracted by its salubrity, made it their capital. It is situated, however, in a barren country, and surrounded by naked granite hills. Pullicate, a sea-port, after enjoying for a long time high prosperity as the chief seat of Dutch commerce on the Coromandel coast, has declined greatly since it came under the power of the British. In the most southerly quarter, Nelloor, on the navigable river Pennar, and Ongole, once a strong fortress, are now chiefly distinguished by a considerable trade in salt.

4243. *The high table-land of Mysore*, rising between the two coasts of southern India which have now been surveyed, is bounded on each side by the chains of the Ghauts. Its general level is about 3000 feet above the sea, and it is diversified by many hills, branching out, sometimes in clusters, from the boundary chains. This elevation, and the coolness which it maintains, renders Mysore the most agreeable and healthful country of India. The western Ghauts break the force of those tremendous floods which are dashed against them from the Indian Ocean, at the same time allowing enough to pass for fertilising the territory. It is accordingly well fitted for yielding all the fruits and agricultural products of India, combined with some which belong to the southern temperate climates. The natives cultivate the territory with imperfect instruments and skill, but with considerable care, and with great attention to the means of irrigation and to the collection of manure. Rice is considered the most important object of culture, and is raised wherever a sufficient supply of water can be procured; but no attempt is made to produce two crops in the year. On the more arid grounds, *raggy*, a coarser grain, is cultivated for the food of the lower orders. Sugar, betel-leaf, opium, and the cocoa-nut palm, are also considerable articles. Iron ore abounds, but it is impure, and is worked by the natives in a very slovenly manner.

4244. *Mysore*, at the conclusion of the last century, was a very powerful *kingdom*, and a most formidable enemy of Britain. Hyder, the son of a Mahometan emigrant officer from the Punjab, began by distinguishing himself in the service of the rajah, and ended by deposing him. He conquered, or rendered tributary, Canara, Calicut, and the other countries on the Malabar coast. On that of Coromandel, he had a harder struggle to maintain. By joining the French, however, he gained several important advantages; and, though repeatedly defeated in the field by Sir Eyre Coote, was always, by his superior cavalry, enabled to keep the field. At the same time he carried on with activity the internal administration; protected property, and promoted the prosperity of his subjects. His son, Tippoo Saib, inherited his courage, without any of his prudence or policy. He ruined his subjects by arbitrary exactions, and used the most intolerant means for converting to Mahometanism a people almost universally attached to the Hindoo creed. He was engaged in almost constant war with Britain; and, in the partial successes which he obtained, treated with the greatest cruelty the captives of that nation who fell into his hands. He was utterly unable, however, in the long run, to resist the mass of disciplined troops which this country brought against him. In 1792 he was completely humbled by Marquess Cornwallis, and stripped of half his dominions. In 1799, having engaged in intrigues with France, he involved himself in a war, the issue of which was still more disastrous. His capital was carried by storm, and he himself killed, fighting sword in hand. A young prince, descended from the ancient dynasty of the country, was invested with the sovereignty of part of his dominions, but allowed to reign entirely as the vassal of Britain.

4245. *Among the cities*, our attention is first arrested by *Seringapatam* (fig. 636.), long the celebrated bulwark of Mysore, and the centre of its power. It is situated at the upper end of an island formed by the

636

SERINGAPATAM.

Cavery, here a large and rapid river, and is properly called Sri Ranga Patam, or the city of Sri Ranga, an appellation of Vishnu. Tippoo transferred hither the seat of government from Bangalore, the favourite residence of Hyder; but he did not display much skill either in strengthening or embellishing the place. Naked rock and dirty mud walls are the predominant features of the island: and the citadel forms an immense, unfinished, unsightly, and injudicious mass of building. The streets are narrow and confused, most of the houses mean, and even those of the chiefs not proportionate to their wealth, as Tippoo would allow no property in houses. Having no manufactures, it was almost entirely supported by the court and camp, the residence of which may have raised the population in its days of splendour to about 150,000. It did not appear to Dr. Buchanan to exceed 32,000.

4246. *Bangalore* (fig. 637.) was founded by Hyder, and rendered by him a place of considerable trade, consisting chiefly in the export of betel, pepper, and sandal wood. It manufactures also a considerable quantity of cloth for internal use. Neglected and oppressed, it has recovered its prosperity under the protection afforded by the reigning dynasty. The fortifications, upon Indian principles, are accounted strong, but proved inadequate to resist the attack of British troops; a circumstance which disgusted Tippoo with the place; though he was unable, as we have seen, to establish another of greater strength. Bangalore, though a royal residence, contains no trace of any splendid building, except the *mahal*, or palace, which, only composed of mud, displays in its halls and courts a certain spacious magnificence and superficial ornament. The accommodations, however, are in many respects imperfect and inconvenient. The gardens appear to have been laid out with very great care. They are divided into square plots, each of which, according to the

Mussulman fashion, has some plant or flower allotted to it, with which it is exclusively filled. The great and difficult operation is to water these gardens; and Tippoo, in the machinery for this purpose, employed

637

BANGALORE.

such masses of masonry as to leave nothing but holes, as it were, through which the trees grow. The vine, the cypress, even the apple and peach, have been here cultivated with success. The town of *Mysore*, about nine miles from *Seringapatam*, had been the seat of the native dynasty, but was neglected under the Mahometan sovereigns. Since their downfall, both the fort and palace have

been rebuilt, and, the rajah having made it his capital, a new and increasing city has been formed around them.

4247. *The Nilgerries*, a mountain range, on the southern extremity of *Mysore*, comprise the most elevated tract in that region, and even in Southern India, rising, at some points, to upwards of 8000 feet. At this height, the climate becomes so temperate, that the *Nilgerries* have lately been employed as a sanatory station for those whose constitutions have been impaired by the intense heats of the plains below. Here the invalid enjoys cool and refreshing breezes, with a rich and romantic scenery of hills, lakes, and waterfalls. This high region is inhabited by the *Tudas*, a simple and manly race of shepherds, speaking a peculiar language, and almost entire strangers to the mythology and manners of the rest of India.

SUBJECT. 5. *Countries on the Himalayah.*

4248. In order to complete the survey of the continent of India, we have still to contemplate the *Himalayah*, a region but loosely appended to it, and marked by characters essentially different from the rest. The luxuriant plains of that region are girt, along their whole northern boundary, by this belt of mountains, the most awful and inaccessible in any part of the globe. On the other side, they sink into the lofty table-land of *Thibet*; but as they face India, and descend by successive stages to the level of *Delhi* and *Bengal*, they exhibit every variety of climate, from the snows of the Arctic circle to the burning plains of the tropic. In this descent, kingdoms lie along their sides, which, in regard both to man and nature, present a rude and northerly aspect, rather European than Indian.

4249. Of these kingdoms, the most important is *Nepal*; but, for the sake of method, we shall begin with the eastern one of *Boutan*, or *Bootan*. This territory rises above *Bengal*, and is separated by the snowy pinnacles from *Thibet*, the territory of the Grand Lama. Its aspect is rugged and lofty in an almost unequalled degree, often presenting scenes the most grand and awful; hills clothed to the summit with large and lofty trees, deep and dark glens, and the tops of lofty mountains lost in the clouds. Their sides are diversified by abrupt precipices, deep dells, and cascades that often dash from an amazing height. Near its northern frontier towers the sovereign peak of *Chumularee*, covered with eternal snow, and seen at a great distance from the plain of *Bengal*, though it does not appear very lofty from the mountain table-land on which it rests. Beyond this point the traveller begins to descend, and soon enters *Thibet*. On the Indian side, so steep has been the acclivity, that from *Ghassa*, where perpetual winter reigns, may be seen *Punakha*, where the rays of a vertical sun cannot be faced without danger. As the traveller ascends, vegetation continually changes its character. He is soon gratified with the view of European fruits, the peach, the apple, the pear, and the apricot; nor is it long before homelier plants, docks, nettles, primroses, and rosebushes, remind him of England. Strawberries, despised by the natives, spontaneously cover the fields. By-and-by the pine and fir, characteristic of northern latitudes, supplant trees of richer foliage. At length even these disappear, and the ground shows only a few stunted shrubs and scanty herbage; but the appearance of the *Thibetian* peak now marks the approach to a different region. *Boutan* is separated from *Bengal* by a tract of wild and marshy forest, about twenty miles in breadth. The excess of heat and moisture here produces a rank luxuriance of wood and jungle, generating an atmosphere truly fatal to the human constitution. A British detachment, stationed here in 1772, was almost entirely cut off; and even the natives, whom habit enables to endure the climate, are a sickly, diminutive, and stunted race.

4250. *The Bouteas* are an entirely different people from those of India, and bear all the characteristics of a Mongol race. They have black hair, small eyes, a broad flat triangular face. Their weapons are chiefly bows and arrows, which they tip with poison, and shoot with dexterity; but though the timid *Hindoo*s fly before them at the first onset, in their contests with each other they do not display any remarkable prowess. Their battle, as viewed by Major Turner, was carried on by hiding themselves beneath bushes, thence occasionally starting up, making a hasty discharge, and replacing themselves under covert. Their industry struggles with most meritorious energy against the rugged surface on which it has to operate. Almost every favourable spot, coated with the smallest portion of soil, is cleared and adapted to cultivation, by being shelved into horizontal beds; not a slope or narrow slip of land remains unimproved. Many of the loftiest mountains bear on their summits and on their sides populous villages amidst orchards and other plantations. The most extravagant traits of rude nature and laborious art are every where presented. The irrigation of the fields is the object of peculiar attention, and water is conveyed by a very simple and useful species of aqueduct, composed of the hollowed branches of trees joined together. Considerable art is often necessary in the construction of bridges over rapid torrents and deep ravines; timber is the usual material, but occasionally iron chains are employed. Their palaces and monasteries are often handsome and spacious; but, having no chimneys, the fire, which is often required, must be made in the middle of the open room, which is soon enveloped in smoke. They are vigorous and healthy, with exception of the prevalence of the *goitre*, that universal scourge of such situations. The climate imposes the necessity of a very different dress from that of India, and renders general the wearing of woollen cloth and even of furs. The people have none of the *Hindoo* scruples relative to animal food and spirituous liquors; but their favourite refreshment is tea, not infused, but beaten up into a mess with water, flour, salt, and butter, in a manner by no means suited to an European palate. Their religion is that of *Booth*, or of the *Lama*, and is exactly similar to that which we shall find existing on a greater scale in *Thibet*.

4251. *Tassisudon*, the residence of the Rajah of *Boutan*, is situated in a very fertile valley, or rather glen, three miles in length, and surrounded by finely wooded mountains. The citadel in the centre is very lofty, the rajah residing near the top, in a palace accessible only by several lofty stairs or ladders. In this palace are accommodated 1500 gylongs, or monks of *Booth*; and in its neighbourhood is a large manufactory of brass gods and religious implements. *Ghassa*, a western capital, is situated amid a range of mountains covered with snow. *Wandipore*, capital of another province, is reckoned a very strong place, and contains numerous convents of monks. *Buxadewar* is a strong fort, commanding the pass from *Hindustan*

into Boutan. *Moorichom*, a small village on a lofty hill, is only mentioned for the beauty of its situation, and the industry displayed in the cultivation of the surrounding fields.

4252. *From the eastern frontier of Boutan westward to the Sutledge and the frontier of the Punjab stretches an expanse of varied mountain territory, which the conquests of the house of Gorkha have united into one great kingdom; but, from the theatre of the first conquest, and from the fertility and populousness of its divisions, it receives the name of Nepal.* Like Boutan, it consists of a series of tracts, changing their character as they rise from the level of the British frontier on the plain of Hindostan. It is girt with a belt of wild and wooded territory, called the Tarryani, which, both from the rank excess of moisture, and from having been the theatre of frequent hostilities, has been almost abandoned by men, and has become the haunt of beasts of prey. These circumstances have, as usual, generated a pestilential air, which renders it at certain seasons destructive to any army acting within its limits. Above the plain rises a range of low hills, watered by numerous streams descending from the mountains behind, and separated by broad valleys similar to the straths of Scotland. Yet, though this district might be rendered very productive, it is greatly neglected, and is covered with an almost uninterrupted forest, composed of a vast variety of trees, among which the most valuable is a species of cinnamon, and the mimosa, out of which caoutchouc, or Indian rubber, is extracted. Above these hilly tracts towers a region decidedly mountainous, which comprises Nepal Proper, and all the most important districts of this territory. The mountains are here arranged in long steep ridges, with narrow valleys interspersed; a structure which renders travelling across them very laborious. The level even of the valleys is supposed to be 4000 feet above that of the plain of Hindostan. Where they present any extent of soil, they are exceedingly productive, the supply of water being ample, and the temperature corresponding to that of the south of Europe. Great agricultural industry is here displayed, and the sides of the mountains are formed into terraces, by which the supply of water may be increased or diminished almost at pleasure; so that the crops are surer than in almost any other part of the world. The woods are particularly magnificent, and flowers of every form and tint cover the fields. No fruits, however, except the orange and pine apple, come to perfection; and both here and in Boutan, vegetables are scanty and defective. Above this mountain region, towers another, called Kuchar, of more awful height, and almost inaccessible, consisting of the loftiest and most rugged steeps of the higher Himalayah. It contains immense rocks, broken into the most tremendous precipices, and shooting up into sharp pinnacles, which are either perpendicular, or covered with perpetual snow. A little scanty herbage, and occasional cultivation, is still found in the steep and narrow glens, till the highest ridge is approached, where the whole region is subject to perpetual winter. The Kuchar is about thirty or forty miles in breadth, and communicates only by tremendous defiles formed by mountain torrents, and overhung by immense precipices, with the table-land of Thibet on the other side of the mountains.

4253. A considerable portion of *mineral wealth* is included in this mountain region. Copper, iron, and lead are produced in abundance, and of excellent quality. The copper, being more rare in the East than in Europe, affords a very handsome profit. Sulphur and lead are found in every part, and particularly in the Kuchar; but the former is avoided, on account of the deleterious quality of the arsenic with which it is combined; while the lead mines are rendered of little value by the impolitic system of rendering them a government monopoly. The quality of the iron is represented to be such, that weapons are produced from it without the necessity of forming it into steel. Rumour has assigned to Nepal metals which occupy a more brilliant place in the estimation of mankind: but the gold thence transmitted appears to come almost entirely from beyond the mountains, and the small quantity of silver ore existing in lead or galena cannot be extracted by the skill of the natives. The valley of Nepal does not contain even a stone; and, rather than incur the expense of transporting the excellent building materials found in the neighbouring mountains, the natives use bricks, for which clay of admirable quality is found in the country.

4254. *The population of Nepal is singularly aggregated of various classes and descriptions of people.* Placed on the brink of two great divisions of the human race, the Hindoo and the Tartar, they have received successive colonies from both. The Newars, who form the basis of the population, are doubtfully traced to either class; but Dr. Hamilton, the latest and most accurate observer, regards them as decidedly Mongol, considerably altered by Hindoo mixture. These Newars are a peaceable diligent race, on whose exertions mainly depends the prosperity of the country, though they are liable to severe exactions from the military government established by the ruder tribes. The Brahmins, at a period prior to any known records, penetrated in great numbers into Nepal, where their superior knowledge soon enabled them to act a leading part. They have now absorbed most of the civil departments of the government, and effected the complete conversion of the people. In this operation, the principal difficulty consisted in persuading these hardy and hungry mountaineers to abstain from using as food the animals with which their pastures abounded. The whole nation is still suspected of a deep hankering after the flesh-pots, and every pretence

is seized for an occasional trespass; but, generally speaking, the exclusion of beef as an article of diet is now complete. In every other outward observance, the Nepalese surpass the zeal of their Hindoo teachers. Colonel Kirkpatrick found almost as many temples as houses, and as many idols as inhabitants. The number of these, indeed, seem much more conspicuous than their richness or ornament. The chief shrine, that of Sumbhoonah, overlooking from a height the valley of Nepal, could only be entered by a high ladder; and, when looked into, presented rather the aspect of a poor kitchen than that of a magnificent temple. This shrine is dedicated to Boodh, and dependent on the rajah of Boutan. We are sorry to learn that no corresponding purity of life and conduct attends this extreme devotion of the inhabitants of Nepal.

4255. *This whole territory is subject to the military government of the rajahs of Gorkha*, originally masters only of a small territory of that name, to the east of Nepal, among the heights of the Upper Himalayah. It was tenanted, however, by the Magars; a bold and warlike race, who were an overmatch for the industrious people of the valleys. In 1761, Pritwi Narayan, partly by marriage and partly by conquest, obtained possession of Nepal Proper. He then employed its ample resources in extending his dominion over that large territory subject to the Chaubisi, or Twenty-four Rajahs, and other surrounding districts. The career of conquest was pursued by his successors. Sikim, the most easterly of the present Nepalese dominions, was conquered in 1788; but it was not until the commencement of the present century that the accession of Garhawal, in which Serinagur is situated, extended the empire to its western limit beyond the Jumna. The government, however, having involved itself in war with Britain, and being completely vanquished, has been obliged to cede these western conquests. Nepal is now bounded on the west by the Kali, leaving Kemaon, Garhawal, and the banks of the Sutledge entirely under British protection. In the chief government, only some institutions remain, which temper the entire despotism of the sovereign. Much regard is paid to birth, and, on occasions of great emergency, a kind of assembly of notables is held, in which men who have neither office nor connection with the government are allowed to speak their sentiments with great freedom; and, though the court is in no degree controlled by these assemblies, which are supposed by Dr. Hamilton to be employed merely as a means of allowing the discontents of the nation to evaporate, they doubtless afford an opportunity for public opinion to declare itself. The three chief ranks are the *chauterija*, or counsellor; the *karije*, or man of business; and the *sirdar*, or military commander. The individual appointed to any of these ranks holds it for life, and communicates the title to his brothers. The *chauterija*, who is nearest relation to the king, is officially prime minister, even though he should be only a minor; but, of course, the authority, in many such cases, must be merely nominal. In the classification of the people, however, the principal distinction is between those of pure and sacred Hindoo birth, and those who, under the brand of *Khas*, or infidel, excite in the mind of the Nepalese the idea of every thing that is impure and base. The character of the former is supported by abstinence from animal food and strong liquors, by strict cleanliness, and by a certain degree of refinement of manners. The *khas*, on the contrary, are distinguished by a secret partiality to the religion of the Lama, an eager longing after beef, and generally by ruder and more uninstructed habits. The reigning dynasty, however, though their own origin is dubious, have zealously adopted the Hindoo cause, and have prohibited, under the strictest penalties, all killing of cows for food; so that the hungriest of the impure tribes dare only feast on those which have died a natural death.

4256. In treating the details of this territory, we shall begin with *Sikim*, the most easterly district, immediately bordering on Boutan. It is the abode of the Lapchas, "a set of vigorous barbarians, about one half of whom have been deluded by the monkish austerities and superior learning of the Lamas." They are chiefly armed with swords and with bows, from which they shoot poisoned arrows. It was with considerable difficulty that they were subjected to the Gorkha kingdom, and compelled to renounce beef, pork, strong liquors, and sundry similar abominations, in which they delighted. Indeed, there still remains a corner, to the extreme east, which retains its independence and ancient customs. Two great rivers traverse this territory, and descend into Bengal; the Tista, on the east, supposed to come from the domain of Lassa and to cross the Snowy Mountains; and on the west the Kankayi.

4257. West from Sikim, the *Kiratas* inhabit a territory of considerable extent, between the Kankayi and the great river Koosi. They are a warlike and enterprising people, and in the days of their independence could muster an army of 90,000 men. Like the Sikimites, they are much addicted to the worship of the Lama and to the eating of animal food; and though the early conquest made by the Hindoos was strenuously employed in suppressing these propensities, they were never completely put down till the late ascendancy of the Gorkha dynasty. Still the Kiratas are understood to feel their changed worship and spare diet as a severe privation, and their very name sounds impure in the ears of a genuine Hindoo. The narrow valleys into which this territory is divided form a number of districts with towns of some magnitude, such as Vizaypur, Chayanpur, Khatany, and Dalka; but none of these plains are of great extent, nor are any of the cities of considerable magnitude.

4258. On crossing the Koosi, we find, between two lofty ridges, the *Valley of Nepal Proper*, the finest and most fertile, Cashmere excepted, of any which the mountain world of India contains. The principal valley is about twenty-two miles from east to west, and twenty from north to south. Its aspect is delightful, being every where finely wooded, well cultivated, and surrounded by a varied amphitheatre of hills above which tower lofty peaks of eternal snow. The entirely alluvial character of its soil strongly indicates that it was once a lake, the limits of which may almost be traced, and which is even mentioned in the early traditions of the nation. The multitude of streams, however, by which it must have been fed, now unite in that of the Gandaki, which forces a passage through the hills into the Tarryani, and ultimately reaches the Ganges.

The inhabitants of the valley are chiefly the Newars, already described, and the Parbatiyas or mountaineers, few of whom can be induced to take up their abode in the cities. The chief of these are Kathmandu, or Catmandoo, the present capital, Zalita Patan, and Bhatgang. The number of houses has been stated at 18,000 in the first, 24,000 in the second, and 12,000 in the third; but Dr. Hamilton does not conceive that the whole number of people can exceed these numbers, unless it be to a small extent in Kathmandu. These towns are neatly built with brick, and the palaces, though possessing no high architectural character, are yet more spacious than could be expected from the narrow territories of the princes by whom they were erected. Colonel Kirkpatrick, on conjectural data, in which Dr. Hamilton seems to acquiesce, estimates the entire population of the valley at about 500,000.

4259. The river Trisul Ganga separates Nepal Proper from the country of the *Chaubisi*, or the *Twenty-four Rajahs*; an extensive territory, traversed from west to east by the great river Gandaki, which appears to rise from beyond the Himalayah. These rajahs occupied each his own little valley, under a sort of feudal dependence on the chief of Yumila, once the most powerful of northern India. These states, however, are chiefly distinguished as containing among their number the original seat of the Gorkhali dynasty, who now hold undisputed empire over all these mountains. Gorkha is a valley much inferior in extent to Nepal, but with a warmer climate, and a soil of considerable fertility. The cultivators consists of Brahmins, but the fighting race are the Magars. Pritwi Narayan introduced the use of matchlocks, which, though neither good nor well managed, gave his troops a great superiority over the other mountaineers, who had no weapons but the sword and the arrow. Although the dynasty have now settled in the rich valley of Nepal, their followers still pride themselves in the title of Gorkhalis. Gorkha, the capital, is a considerable town of 2000 houses. Previous to the entire ascendancy of this dynasty, the rajahs of Palpa were considered the most powerful of the twenty-four, and were at the head of a numerous confederacy.

4260. West from the Chaubisi occurs another cluster of *twenty-two*, called the *Baisi Rajahs*. Of these, previous to the Gorkha conquest, by far the most distinguished was Yumila, forming the most northerly district, and extending along the foot of the highest mountains. It contains a valley almost equal in extent to that of Nepal, overtopped on all sides with snowy peaks, but fertile in grain, though not suited to rice or the sugar-cane. It supplies, however, the neighbouring countries with salt, from a place called Mukhola. The capital is Chinachin, which has not been visited by any European; but is described as a large straggling town. The chief of Yumila is a Rajpoot, and was long acknowledged as supreme lord over all the mountain chiefs towards the west. His power, however, was not quite equal to that exercised by the emperors of Germany over the members of that confederacy. Each chief sent him an annual embassy with presents; he bestowed the mark of royalty on each heir, at his succession; and he had a right to interpose in keeping the stronger from overpowering the weaker. The reigning chief, however, had not the foresight to interpose in defending any of his neighbours against the spreading power of Gorkha, but allowed it to increase, till it eventually overwhelmed himself.

4261. The western boundary of Yumila and of the Baisi Rajahs is formed by the Kali, which is considered as dividing the mountain territory of India into two great portions, and which, since the last treaty, forms the western boundary of the Nepal dominions. On crossing to its western side, we enter the region of Hindoo purity, where the veneration for the Lama and the hankering after beef, for which the eastern tribes are regarded with such disgust and horror by every pure worshipper, no longer prevail.

4262. The first district, *Kemaon*, or *Kuman*, though mountainous, is covered with fine verdure and extensive forests, and in many places yields large crops of summer rice. The inhabitants consist chiefly of Rajpoots, with a mixture of Sudras and Brahmins; the impure races having been either expelled or converted. In consequence of the last war, it is now *subject to Britain*. Almora, the capital, is a town of 1000 houses, irregularly scattered over the top of a high ridge of mountains, and carries on a considerable trade.

4263. To the west of Kemaon is the territory now called *Garhawal*, but much better known under that of *Serinagur*. It is in an especial sense the holy land of the Himalayah, containing the source of the Ganges, and five *prayagas*, or junctions of its tributary streams. Thence it derives sufficient claims, according to Indian ideas, to be considered as a place of the loftiest sanctity. Indeed, the awful scene which it every where presents, of rugged rocks, deep glens, and mountain rising over mountain, could not fail to excite the deepest emotions in the pilgrims by whom it was visited. Serinagur presents none of those deep and fertile valleys which enable the countries to the east to support a large population. The places capable of culture consist almost solely of small ridges, or table-lands, at the top of the mountains. The roads are often cut along the sides of high perpendicular rocks, and the torrents are passed by bridges of rope stretched across. On the largest of these table-lands, about a mile and a half square, Serinagur is built, from the mere impossibility, it would seem, of finding another spot which would afford sufficient space. Various vicissitudes, however, and particularly the invasion of the Gorkhalis, and the system of misrule which they established, entirely deprived Serinagur of the slender measure of prosperity which it ever enjoyed, and it is now a scene of extreme poverty. It is still, however, a considerable thoroughfare for those devoted pilgrims who, after frequenting the fair of Hurdwar, venture to visit the thrice-sacred spot where the infant Ganges descends from the snowy steeps of Himalayah. The journey is attended with great difficulty and peril, and a considerable number perish on the road. The first town above Serinagur is Josimath, the winter residence of the high-priest of the Ganges, which contains numerous temples. It lies on the Alacananda, one of the two branches which concur to form the Ganges. On tracing it upwards, is found Manah, a village containing 14,000 or 15,000 inhabitants; the chief practicable entrance into which is across the mountain passes by this place. On the opposite side of the river is Bhadrinath, the seat of that famed sanctuary which is frequented by crowds of Hindoo pilgrims. It is built in the form of a cone, roofed with copper, and having a spire surmounted with a golden ball at the top. Only an imperfect view is allowed of the inner sanctuary, in which is seated the image of Bhadrinath, a figure of black stone, about three feet high, covered with a rich drapery of gold and silver brocade. A silver salver is handed round to receive the offerings, which are expected to be liberal. There are also several cold and hot springs, each of which has a sanctifying virtue, to be purchased by the penitent with a portion of his earthly goods. Such transactions would render these shrines very rich, were it not that the chiefs, in their extreme need, have often eyed them as a source of pecuniary relief; and though the sanctity of the place may prevent them from

absolute plunder, yet, by borrowing or exchange, of which they can dictate the terms, they have dissipated a large portion of these holy treasures.

4264. About thirty miles west from Bhadrinath is *Gangoutri*, a village near the head of the Bhagirati, considered the main and proper head of the Ganges. A few miles above, it is seen flowing with a moderate current, fifteen or twenty yards broad, and about waist deep. Higher up, it flows beneath beds of snow, so deep that even its sound is not heard. At length is perceived a wall of rock, from an angle of which, called by the Hindoos the Cow's Mouth, on account of its rude resemblance to that orifice, issues the Ganges. "Nothing," according to Mr. Fraser, "can surpass the grandeur of the scene which is here presented. The bare and peaked cliffs shoot to the skies; their ruins lie in wild chaotic masses at their feet, and scantier wood imperfectly relieves their nakedness; even the dark pine more rarely roots itself in the deep chasms which time has worn. Thus, on all sides is the prospect closed, except in front to the eastward, where, from a mass of bare spires, four huge, lofty, snowy peaks arise: these are the peaks of Roodroo Himalayah. There could be no finer finishing, no grander close, to such a scene."

4265. *At a small distance*, and from the same stupendous ridge which contains the source of the greatest river of India, is found that of its main tributary, the Jumna. The glen, near Bunderpouch, through which its infant course passes, is described to be rugged and gloomy beyond description. "It looks like the ruins of nature, and appears," as it is said to be, "impracticable and impenetrable. Little is to be seen, except dark rock; wood only fringes the lower parts and the water's edge; perhaps, the spots and streaks of snow, contrasting with the general blackness of the scene, heighten the appearance of desolation. No living thing is seen; no motion but that of the waters; no sound but their roar."

4266. *The territory of Sirmore*, and that of the Twelve Lordships, extending along the Sutledge, subject to a number of independent rajahs till over-run by the Gorkhas, have now been restored to those chiefs, under the protection of Britain. The valley of the Sutledge presents little cultivation: the mountains are brown, barren, steep, and rocky; the bed of the river narrow and arid. In the territory of Joobul, however, the mountains are covered with the most magnificent forests; pines, hollies, oaks, sycamore, and yew, of the most varied forms, and often of gigantic size. The cultivation is very great, and the perpendicular sides of the mountains have been most laboriously fitted for it; so that districts naturally barren are even enabled to export grain. The inhabitants appeared to Mr. Fraser every way superior in external accommodation to the Scotch highlanders; but their character was by no means regarded in so favourable a light, combining the rude habits and violent feuds of a barbarous race with the cringing and abject spirit of an Asiatic despotism. West from the Sutledge, the territory along the head of the Punjab is occupied by a number of independent rajahs, engaged in frequent hostilities with each other. Among the principal are Bischur, Sirmore, Joobul, Kahlare, Hindoor. These territories occupy the deep mountain valleys of the Sutledge, overhung by brown heathy steeps, of the Tonse, and of the Pahur, which flows through a more smiling valley. The capitals are small towns, built often in stages on the steep sides of rocky mountains. Such is the situation of Rampore, capital of Bischur, on a high bank above the Sutledge. Nahn, the capital of Sirmore, occupies so rugged a steep, that its streets consist of steps cut in the rock. Notwithstanding the barrenness of the surrounding country, the commerce with Thibet and Tartary enables these mountain capitals to attain some little wealth and importance.

4267. *After scaling the mighty boundary wall of western India*, the traveller looks down on its northern side into Cashmere, an extended valley, which nature has lavishly adorned with all the attributes of a terrestrial paradise. It is enclosed on every side within tremendous steeps, which separate it, to the north from Thibet, and to the west from Cabul and Candahar. Numberless rivulets, descending from these heights, diffuse on all sides verdure and fertility, and render the whole country, as it were, an evergreen garden. Rice, wheat, barley; the grain and the fruits both of the tropical and temperate climates, are produced in equal abundance and perfection. The plane tree nowhere spreads such a pomp of foliage. But the peculiar boast of Cashmere is its rose, a favourite theme of Eastern poetry, whose tints and perfume are said to be alike unrivalled. The numerous streams unite in the Jelum, which, after forming several small lakes, rolls westward, forces the mountain barrier, and finally joins the Chunab.

4268. *The Cashmerians* are a Hindoo race, differing in several respects from those by whom they are surrounded. They are active, industrious, and, at the same time, witty and ingenious, with a taste for poetry and the sciences. On the other hand, they are represented as volatile, treacherous, extravagantly addicted to pleasure, rapacious in acquiring money, lavish in spending it. The beauty of the females is much famed in the Eastern world, and seemingly not without reason, though greatly enhanced by contrast with the dark complexions of India, and the deformed visages of the Tartar races. A sad reverse has befallen their country, since the time when it was the favourite residence of the Mogul, who, viewing it as the paradise of the Indies, repaired thither whenever he wished an interval of recreation, and bestowed his cares and wealth in lavishly adorning it. On the fall of that power, Cashmere was subdued by the Afghans, and placed under the rule of governors who have cruelly tyrannised over it, and stripped it of a large portion of its former prosperity. Since their kingdom was broken up, this country has been disputed between one of the branches of its royal family and Runjeet Sing, in whose power it now is. The revenue is reckoned at 500,000*l*.

4269. *The Cashmerians are a manufacturing nation.* They work skilfully in wood, make the best paper in the East, and excel in cutlery and lackered ware. But the grand branch of industry consists in their shawls, from the wool of the goat of Thibet, which are in general request all over the world. The natives complain that the tyranny of the Afghans has made deep inroads on this branch of industry, and has reduced the number of looms from 40,000 to 16,000. This work seems to be conducted upon a more extended scale than is usual in India, one merchant often employing a great number of looms. Three men work at each loom; and a year is sometimes spent in making a single shawl. In the best and most elaborate kinds, it is considered enough if they execute an inch and a half in the day. Of course, the ordinary shawls are made with much greater expedition.

4270. *The city of Cashmere,* called anciently Serinagur, is the largest in the Afghan dominions, containing from 150,000 to 200,000 people. It extends three miles along the banks of the Jelum, in a situation, the beauty of which has been widely celebrated, particularly its lake, studded with numberless islands, green with gardens and groves, and having its banks environed with villas and ornamented grounds.

4271. CEYLON, an extensive, somewhat wild, but beautiful island, forms a close appendage to India, lying to the east of its southern extremity, whence it is separated by the Straits of Manaar. It is nearly 300 miles in length, and 160 in its greatest breadth. The territory, along the western coast, is occupied by a somewhat extensive plain; beyond which, ranges, first of hills, and then of mountains, rise successively behind each other, and with their rugged surface cover a great extent of the island. They do not, however, rise to any very lofty height; since Adam's Peak (the most elevated) is only 6152 feet above the sea. These steeps are generally covered with extensive forests and dense underwood, which give to a great part of the island the character of jungle.

4272. *The history of Ceylon* is scarcely at all known previous to the arrival of the Portuguese in 1505, at which time they found the native sovereign defending himself with difficulty against the attack of the Arabs. They at first merely exacted a tribute, but soon engaged in a series of warfare, which ended in driving the natives from Colombo and most of the other stations on the coast, and obliging them to take refuge in the interior. They settled in considerable numbers; and a pretty large body of their posterity, mingled with the natives, still survive. Ceylon, however, shared the lot of their other Indian possessions; and, in the course of the seventeenth century, after a series of bloody struggles, was wrested from them by the Dutch. It remained in their possession, with the exception of a short occupation of Trincomalee by the British in 1782, till 1796, when an English expedition entirely subdued it; and by the peace of Amiens it was finally ceded to that power. In 1815 the British beat the king of Candy, occupied his capital in the mountainous interior of the country, and thus became entire masters of this fine island. It has been made a royal colony, not subject to the rule of the East India Company.

4273. *The produce and wealth of Ceylon* are not in proportion to its natural capacities. Much of its surface, indeed, is mountainous and craggy; and there are large sandy tracts along the coast. Rice, though almost the only object of native culture, is not raised in sufficient quantity for the support of the inhabitants. The most peculiar product is cinnamon, one of the most delicate of spices, and for which there exists an extensive demand in Europe. It is a species of laurel, from four to ten feet high, with numerous branches, and with a light porous wood. It grows spontaneously over a great part of the island; but that reared in gardens in the vicinity of Colombo is considered the best. The bark, which is the valuable part, is taken off when the plant is three years old, and requires no preparation except being spread out to dry. The cocoa nut tree is also in great abundance; and its fruit, as well as coir, a species of rope manufactured from its husk, are staple exports. A great quantity of arrack is distilled from its juice. Animals, chiefly wild, are abundant; but the only valuable one is the elephant, which, in Ceylon, is considered of better quality than in any other country in the world: it is not, indeed, so tall as on the Continent, but peculiarly active, hardy, and docile. No elephants are reared in a tame state; but they are easily caught in pits prepared for the purpose, and are tamed in eight or ten days. An uncommon variety of precious minerals are found in Ceylon; the ruby, the amethyst, the topaz, and even the diamond: but none of them are of fine quality. There are mines of lead, iron, tin, and quicksilver; but little wrought. A very extensive pearl fishery is carried on in the Straits of Manaar, about fifteen miles from the shore; but chiefly by boats from the coast of India. In 1804 it was leased for 120,000*l.*; but since that time has declined; and in 1828 its amount was only 30,612*l.* A species of conch shells called chanks, much used by the Hindoos for rings and other ornaments, is fished in the Straits of Manaar. Mr. M'Culloch gives the value of the exports in 1825, at—Cinnamon, 114,418*l.*; arrack, 21,500*l.*; coir, 10,000*l.*; cocoa nuts, 7561*l.*; chank shells, 8219*l.*; timber, 12,100*l.*; jaggery, 4,946*l.* coffee, 13,883*l.* The trade has been much fettered by impolitic restrictions, both the produce and sale of cinnamon being made a monopoly of the government; but a more liberal system has recently been adopted.

4274. *The population of Ceylon* was estimated at about a million and a half, till, in 1814, a census of all the part of it then in possession of Britain gave only 496,000; and another, in 1825, of the whole island, exhibited only 754,000. These enumerations were probably somewhat defective, and the numbers are supposed to have since increased, and to amount

now to about 900,000. The natives, called Cingalese, appear to partake of the character of those of Hindostan, Birmah, Siam, and the Oriental islands, with all of whom they hold intercourse. They are a fine and handsome race, and in their manners polished and courteous; but they are indolent, and very little advanced in the arts and sciences. As in all countries bordering on India, the religion of Boodh is established. The Siamese are even said to look to Ceylon as the quarter from which they received that faith; but this sacred character is probably an illusion derived from distance and mystery. It is remarkable that, here, as in Thibet and some other Boodhist countries, the unnatural custom of the plurality of husbands prevails; and it is said to be accompanied, to a certain extent, with the crime of infanticide. The rugged jungly tracts of the interior are inhabited by a savage race called the Beddahs, who subsist by hunting, and sleep under trees, which they climb like monkeys: some of them, however, are employed in exchanging ivory, honey, and wax, for cloth, iron, and knives. The Portuguese and Dutch inhabitants retain their European customs, considerably modified by the adoption of those of the natives. No such modification has taken place in the case of the English, who consist chiefly of king's troops stationed at the chief towns.

4275. *Of the towns and sea-ports of Ceylon*, Colombo, on the west coast, is the seat both of government and of almost all the foreign trade. It owes this advantage to its situation in the midst of the most fertile and productive territory in the island. Its accommodation for shipping consists merely of a roadstead, tenable only during four months of the year. The place is well built, with broad and regular streets, and contains about 50,000 inhabitants, who include an uncommon variety of Asiatic races. The fort is spacious, surrounded with a broad and deep ditch. Trincomalee, on the south-east, is situated amid a mountain territory that is singularly grand and beautiful, but very unfruitful. It has, however, the advantage of containing the finest harbour in those seas. The value of this is greatly heightened by there not being, on the whole coast of Coromandel, a safe roadstead; so that all vessels driven from their stations on that coast seek shelter at Trincomalee. The town however, being supported only by this resort, is small and poor; though the late establishment of a naval arsenal promises to give it greater importance. Point de Galle, at the southern extremity, has a spacious and generally secure harbour, in a beautiful and healthy situation. The native population is numerous; but there are few European settlers. At Bellegam, in the vicinity, is a large temple of Boodh, with a colossal statue of that divinity. Candy, the interior capital, is only a large straggling village, surrounded by wooded hills that echo continually with the cries of birds and wild animals. It contains an extensive though not lofty palace of the king, and several Boodhist temples painted with gaudy colours. The British government has constructed an excellent road to this place from the coast.

CHAP. VII.

INDO-CHINESE COUNTRIES.

4276. *The Indo-Chinese countries* compose that extensive region situated between India and China, and partaking, under some modifications, the physical and political character of both. This region has had little share in the great transactions of which Asia has been the theatre; yet it comprises a number of extensive and important kingdoms, some of which have been alternately united and separated; Ava, Arracan, Pegu, Siam, Cochin-China, Cambodia, Tsiompa, Laos, and Tonquin.

SECT. I. *General Outline and Aspect.*

4277. *The Indo-Chinese region* consists of an extensive maritime territory, throwing out wide peninsular tracts into the Indian sea; separated by various seas, straits, and sounds from its large islands. From Hindostan, on the east, it is divided by the Bay of Bengal; while, on the north, a range of imperfectly known boundaries, chiefly of a mountainous character, separates it from China and Thibet. The main body of this territory may be described as situated between 9° and 23° of north latitude, 92° and 109° of east longitude; but these limits do not include the long peninsula of Malaya, which stretches southward to within less than two degrees of the equator. We shall thus have a square space of about 1000 miles in each direction, and containing probably about 1,000,000 square miles.

4278. *The surface of this great territory*, according to the general view taken by Captain Low, is formed by a series of mountain ranges running from north to south, and forming

branches from the mighty chain of Himalayah, which crosses Asia from west to east. Between each of these ranges intervenes a broad valley, in general of extreme fertility, and watered by a large river descending from the mountain frontier of China and Thibet. These valleys either form, or have formed, separate kingdoms; and, though conquest occasionally unites several under one head, the boundary of hill and jungle within which each is enclosed affords to it, usually at no very distant period, an opportunity of shaking off the yoke. The mountains have hitherto been very little observed, being covered with extensive forests entangled with thick underwood, and filled with wild beasts. Those which form the northern frontier of Assam are exceedingly lofty, falling little short of the Himalayah, of which they are a continuation. Elsewhere they do not appear to be of the first rank in point of elevation: Mr. Crawford conceives that the highest of the central range which borders on Siam does not exceed 5000 feet. The rivers are of greater importance. The Menam, which waters Siam, and is called by the natives the mother of waters, appears to rise among the mountains of Yunan. To the twentieth degree of latitude it is navigable only for canoes: but, on reaching Yuthia, the old capital, it becomes a noble and navigable stream; and, after a course of about 800 miles, enters the Gulf of Siam by three channels, the most easterly admitting vessels of the first magnitude. The Irawaddy, or river of Ava, appears a stream of nearly equal importance, and is navigable several hundred miles for large boats. Its upper course is still involved in mystery; and M. Klaproth has recently discovered some grounds for believing that it is identical with the Sanpoo, or river of Thibet, hitherto regarded as the head of the Brahmapoutra. The Mekon or Donnai, in Cambodia, is also a noble river, which passes through Yunan, and is navigable in 22° or 23° north latitude, twenty days' sail above its mouth. The other rivers are numerous, and many of them fall into the sea; but a greater number are tributaries to the three main trunks already mentioned. The country is broken by several large bays, particularly those of Siam, Martaban, and Turon; but it contains no lakes of any importance.

SECT. II. *Natural Geography.*

4279. There are no materials on which we can attempt a botanical or geological delineation of this territory.

4280. *The Zoology* also of these immense and luxuriant regions is scarcely known; we can therefore merely notice a few of those extraordinary animals which appear natives of these unexplored countries.

4281. *The Quadrupeds* more peculiar to Malacca are the following:—

Simia Satyrus. The Orang Outang.
Hylobates Lar. Large Gibbon.
Hylobates variegatus. Little Gibbon.

Hylobates leuciscus. Silvery Gibbon.
Cervus malaccensis. Malacca Stag.

4282. *The manners of the Orang Outang* (or more properly *Orang Utan*) (*fig. 639.*), so well

ORANG OUTANG.

known for its remote resemblance to the human form, long remained enveloped in fable, until given by Dr. Abel, who brought a living one to England, and who had seen many others. The fables of early voyagers, and of some later naturalists, of this gigantic ape walking erect, waging war with clubs, &c., are now exploded. The height of the adult animal is uncertain; those brought to Europe, being young, have not exceeded three or four French feet; the great toes have but one joint, and no nail. The hair is reddish brown, but there is none on the face, or on the palms of the hands and feet. It is perfectly incapable, says Dr. Abel, of walking in an erect posture: this is betrayed in his whole external conformation, which is precisely that adapted for climbing trees and living among the branches. The Orang Outang has none of the grimaces and antics of other monkeys, nor does it possess their proneness to mischief. Gravity, approaching to melancholy, and mildness are often expressed in its countenance, and seem to be its natural disposition. The specimen in question was mild under injuries, and soon

became strongly attached to those who treated him kindly. M. Cuvier has been induced to think that the *Orang Outang* is no other than the young of the *Pongo*, a much larger ape, inhabiting the interior of Borneo. Dr. Harewood, however, has recently adduced very strong arguments to show that the *Pongo* is a distinct species.

4283. *The Gibbon Apes* are distinguished from all others by the enormous length of the arms, or more properly the fore-feet; these nearly touching the ground when the animal is placed erect. The species most generally known is the Black-handed Gibbon (*Hylobates Lar.* Ill.); its size is much inferior to that of the *Orang Outang*, as the largest specimens do not exceed four feet. The disposition of these apes is naturally gentle, gay, and even frolicsome, and they receive their food, in confinement, without greediness or impatience.

4284. *The few Birds* that have been brought from Malacca are splendid and curious; but

CROWNED PHEASANT.

640

it is impossible to conjecture how many others, unknown even by name, lie hidden from the naturalist in the vast and unexplored forests. Malacca seems to abound with snow-white Cockatoos, splendid red Lories, and many-coloured Parrots and Parrakeets. It is in this peninsula that the gigantic Argus Pheasant, and the Cryptonyx, two of the most striking gallinaceous birds of Asia, are found.

4285. *The gigantic Argus Pheasant* is more than six feet and a half long : the two middle tail feathers alone being nearly four feet, elegantly marked by numerous snow-white dots, on a chestnut ground : the whole plumage is variegated with spots resembling eyes, and the quill feathers are blue. In its wild state, it has a great antipathy to light, being very dull during the day, but active as night approaches. It is found also in Sumatra ; but is so difficult to be kept alive, that it seldom survives in captivity more than a month : hence this beautiful bird has never been brought to Europe but as skins.

4286. *The Crowned Pheasant* (*Cryptonyx coronatus* T.) (fig. 640.) is a much smaller bird, but equally difficult to rear. It inhabits the deep forests both of Malacca and Java, and is distinguished by an erect chestnut crest of feathers, having their webs disunited.

SECT. III. Historical Geography.

4287. *The knowledge of the ancients respecting this extremity of Asia* was neither extensive nor accurate, and scarcely reached the shores east of the Ganges. There, indeed, Ptolemy exhibits the Golden Chersonese, the Great Bay, the coast of Sinæ, and the city of Thinæ ; features which are found by Gosselin in the mouths of the Irawaddy, the Gulf of Martaban, the coast and city of Tenasserim. Others, however, suppose the Sinæ to be the Chinese, and infer that the knowledge of the Romans reached to the coasts of that celebrated empire. It is at all events certain that the ideas of the ancients respecting all this range of coast were extremely confused and imperfect.

4288. *The information also of the moderns respecting this portion of Asia* was long extremely defective. Marco Polo and Oderic of Portenau were the first who gave some vague ideas respecting it. The Portuguese, amid their wide career of conquest and settlement, did not attempt to comprehend any portion of it except the detached peninsula of Malacca, on which they formed a settlement. The French, however, sent to Siam a mission, partly religious and partly political, and through which Loubere obtained some important information respecting that great monarchy. But it is by their political relations with British India that these countries have become, though still imperfectly, somewhat better known in Europe.

4289. *Ava, or the Birman empire*, has been subject to the most remarkable revolutions of any of these kingdoms. It comprised three that are naturally and originally independent, — Ava or Burma, Arracan, and Pegu ; but each struggling for, and alternately gaining, the ascendancy. Pegu, at the first arrival of the Portuguese, was found the ruling state, and its court displayed considerable pomp. About the middle of the sixteenth century, the Birmans rebelled against this authority, and not only established their own independence, but subdued their former masters. This supremacy continued till about the middle of the eighteenth century, when the Peguese, having obtained arms and officers from the Dutch and Portuguese, turned them against the Birmans, gained successive victories, and finally reduced the capital, making prisoner Dweepdee, the last of a long line of Birman kings. A reaction, however, in no long time arose among this naturally brave and energetic people. Alompra, a man of humble birth, collected a band of his countrymen, and carried on for some time a desultory and guerrilla warfare. His forces gradually increasing, he suddenly attacked and took Ava, and succeeded in raising a general insurrection against the king of Pegu. A powerful army sent by that prince was totally defeated ; and Alompra, following up his success, invaded Pegu, and gained a series of victories which made him master of the capital, and extinguished the Tallieu or Pegu dynasty. His successor, Shemburen, subdued a revolt of this nation, defeated the Chinese in a great battle, and gained possession of Siam, but was unable to retain any part of that monarchy, except the provinces of Mergui and Tenasserim, on the western coast of Malacca. His brother, Minderagee Praw, who afterwards ascended the throne, succeeded in annexing Arracan to the empire. The Birman dominion thus became extremely powerful, as, besides these three great kingdoms, its influence was established over the territories of Cachar, Cassay, and others bordering on Bengal, through which it came in contact with the British territory. Two proud and powerful states were not likely to be long in proximity without some collision. A series of misunderstandings at length produced open rupture ; and all the disposable force of British India was in 1826 embarked for the invasion of the Birman empire. The court of Ava, long accustomed to vanquish and domineer over all its neighbours, could not be induced to view with apprehension one which had not even a royal name at its head. A very short conflict was necessary to impress on them the superiority of the British arms : yet sickness, the natural obstacles of the country, and the difficulty of transporting provisions and stores, long paralysed the active efforts of the invaders ; but when at last they began to move upon the capital, all efforts to prevent their advance were completely baffled ; and the Birman

government, after repeated defeats, seeing no chance of preserving the seat of government from foreign occupation, signed a humiliating treaty, paying a large sum for the expenses of the war, and ceding the important acquisitions of Arracan, Mergui, Tavoy, and Tenasserim, which are now comprehended within the wide limits of the British Indian empire.

4290. *Siam*, consisting of a single great valley at the head of a wide gulf, and enclosed by two ranges of mountains, which, if not very lofty, are steep and encumbered, has maintained a more stable character than any other of this cluster of kingdoms. It was indeed subdued by the Birmans in the height of their power; but on this, as on other occasions, the strong national feeling of the Siamese impelled them to rise on the invader, who, entangled in difficult passes, and attacked by contagious diseases, was ultimately obliged to quit his hold of the country.

4291. *Cochin-China, Cambodia, and Tonquin* form three great countries to the east of Siam, to which those of Laos and Tsiompa may almost rank as mere appendages. Of these countries, little more than the name was known to Europe until about half a century ago, when they were brought into notice by an interesting revolution. In 1774, Caung Shung, the young king, was dethroned and driven from his capital by a triumvirate of usurpers, who assumed the supreme sway. The prince took refuge in a desert island, where he lived for several years in the utmost distress. But Adran, a French missionary, who had aided him in effecting his escape, continued to support his cause, and spared no efforts to replace the young monarch on the throne of his ancestors. He even went over to solicit assistance in France; but the disturbed state of that country, in consequence of the revolution, prevented him from meeting with much success. Yet he procured some aid in arms and officers for Caung Shung, who, having landed in 1790 on the continent, was welcomed by his subjects, and by their aid soon replaced on the throne. The circumstances under which his restoration had been achieved led him to form a strong attachment to Europeans, and a desire to introduce those improvements, especially in the military art, by which they were so much distinguished above his own subjects. Having organised a standing army tolerably armed, and disciplined in the European manner, and a fleet of three hundred gun-boats, with a frigate, he acquired a force with which no power in this part of Asia could cope. He was thus enabled to conquer first Tonquin, a kingdom greater and more populous than his own, and afterwards Cambodia, and thus to become master of all that great range of territory which extends between the gulfs of Siam and Tonquin.

SECT. IV. *Political Geography.*

4292. *The government of all these kingdoms* is of the same simple structure as that of Eastern countries in general. In principle, at least, it is a pure despotism; in which no constitutional check on the authority of the monarch is recognised. The state officers, called in Ava *woongees, woondosks, and attawoons*, compose a sort of council of state, but entirely subject to the monarch, and removable at his pleasure. The great lords hold certain portions of land or fiefs, in virtue of which they are bound to the performance of military service. They occupy these only as grants from the crown, resumable at pleasure, and which are judged to cease and to require renewal at the accession of each monarch; but, in fact, unless upon signal ground of displeasure, it is not customary to remove them. The nobles, especially in Siam, show the most profound submission, and approach the throne in the most abject manner, lying prostrate on their faces, and creeping on the ground. The king has many pompous titles, but that of *shoe*, or golden, is the one most valued, and which must be applied to him on every occasion: — “a sound has reached the golden ears; a suitor has arrived at the golden feet; a smell has saluted the golden nostrils.” The king appears in public only on state occasions, surrounded by his nobles, in a sitting posture. The costume of the king of Cochin-China (*fig. 641.*) is very peculiar and extremely splendid.

641

KING OF COCHIN-CHINA.

4293. *The laws of these kingdoms* are chiefly borrowed from Hindostan and China: they are well combined, executed with strictness, and a rigid police is maintained. The Birman laws are of Hindoo origin, and are supposed to have been transmitted from Ceylon by way of Arracan. The code is called the *Dirma Sastra*, and is one of the many commentaries on Menu: it is replete with sound morality, and inculcates severe and salutary lessons, even to the monarch, on the high duties of his station. With the exception of trial by ordeal and imprecation, which is admitted by the superstitious ideas of the East, it is the most judicious and practical of all

the Hindoo systems. Civil cases are first tried in the courts of the *maywoons* or vice-roys, from which lies an appeal, though an expensive one, to the *lotoo*, or supreme tribunal, composed of the council of state, which reports upon them to the king. Thus, however, the judicial power is entirely under the control of the executive, and all offences

which are supposed to affect the safety or prerogative of the sovereign are punished with disproportionate rigour. In Cochin-China all the branches of administration are executed by mandarins of different classes, according to the Chinese model; but the political system is by no means reduced to the same regular form as in that great empire.

4294. *The military strength of these kingdoms* consists almost entirely of a feudal militia, for which all males of a certain age are enrolled, and may be called upon to serve under the chiefs of their respective districts. Their arms are mostly swords, lances, and cross-bows; though they have collected a considerable number of fire-arms; but these, being chiefly the muskets condemned in the English arsenals, cannot, by the most anxious exertions of art and skill, be brought into a serviceable state. The only exception is in Cochin-China, where the European officers in the king's service have effected considerable improvements. But the most efficient part of the establishment consists in the war boats, destined to act on the great rivers which form the main channels of communication in all these kingdoms. Those of the Birmans are constructed out of the solid trunk of the teak tree, and some of them are from eighty to a hundred feet long, though only about eight feet broad. The excavation is effected partly by fire and partly by cutting implements. Every town in the vicinity of the river, besides its quota of men, is obliged, when called upon, to furnish a certain number of these boats, of which it is supposed that the king can muster 500. They carry from fifty to sixty rowers, each provided with a sword and lance, besides whom there are usually thirty soldiers armed with muskets; while on the prow, which is flat, a piece of ordnance, weighing from six to twelve pounds, is mounted. On coming in view of the enemy, they draw up in a line, with their prows in front, sing a war song, push on with impetuous rapidity, and immediately attempt to grapple, when a desperate struggle takes place. The larger boats also seek to run down the smaller, which the latter elude with great dexterity. Gilded barges (*fig. 642.*) can be used only by princes of the blood and persons of the very

highest rank, and they are often very highly ornamented. The naval arsenal, also, of the Cochin-Chinese appeared to Mr. White very deserving of admiration; and the skill of their shipwrights is much superior to that of the Birmans. He saw one teak plank 109 feet long, and has even seen trees of this description which would make a natural mainmast for a ship

ROYAL GOLDEN BARGE.

of war. The state barges are richly decorated with gilding and carved work, and with floating pennons and streamers. On land, the Birmans and Siamese trust chiefly to their stockades, which they throw up with surprising skill and expedition, and which sometimes resisted even the most impetuous attacks of a British force. In general, however, none of these troops can stand the charge of a disciplined army, but, as soon as their defences are penetrated, they take to flight with precipitation. In Cochin-China only a regular army has been organised and trained in the European manner: this force, in 1800, was estimated at 140,000 men; but Mr. Crawford does not imagine it at present to exceed 50,000, of whom the royal guards amount to 30,000.

4295. *The revenue of the sovereign*, in these kingdoms, consists of a land tax, or rather rent; for the whole country, according to the idea prevalent in the East, is esteemed the property of the monarch. This tax is levied in the form of a proportion of the produce, which in Birmah amounts to a tenth, and is paid in kind. The other source, derived from foreign commerce, is levied partly in the form of customs, but more frequently in the ruinous and unproductive one of royal monopoly. This, in Siam, extends to every branch of foreign trade, and in Cochin-China to those which are supposed most productive. From these various sources, however imperfectly administered, money is continually entering the royal coffers, and little or none ever goes out, for services are paid by grants of land, villages, customs, &c., by which the grantee is enabled to make out an income for himself. The Eastern kings are thus enabled to effect a favourite object of their ambition, in the accumulation of treasures, believed in several instances to be immense. The vague reports which Major Symes heard respecting the ample resources of the king of Ava seem confirmed by the promptitude with which he paid the large tribute exacted by Britain as the price of peace. Mr. Crawford was informed that the treasure of the king of Cochin-China amounted in gold to 7,140,000 dollars, independent of what might exist in the form of silver.

SECT. V. *Productive Industry.*

4296. *The productive capacities of this region* are very ample. It yields all the grand staples of tropical produce. The valleys of its great rivers, which possess the expanse of plains, are watered, and, at periodical intervals, extensively inundated, by numerous streams of various magnitude, flowing down from the mountain ridges, to swell the great rivers; and by these means copious moisture, which, under this climate, almost alone suffices to secure an ample vegetation, is constantly supplied. The principal culture consists of rice, the food of all these nations; sugar of fine quality, pepper, preferable to that of the Malay countries, and cotton. The sides of the great ranges of hills are covered with luxuriant timber of various species and great value. There are large forests of teak, a wood now found to be preferable, from its strength and durability, to any other, for the purposes of ship-building. Large boats, as already observed, are often cut out from a single tree, and a great quantity is now produced for the supply of the naval arsenals of British India. Even the fir is found on the tops of the upper mountains, and in Major Symes's opinion might be employed with advantage in masts, for which teak is too heavy. The woods abound also with ornamental trees, canes, rattan, &c., and with others yielding rich gums, which serve for varnish and other purposes. Stick lac and gamboge are among the chief articles of export. From other shrubs are obtained the areca nut and betel leaf, that universal article of luxury and ceremony in all Indian countries, but which has never made its way into Europe. Cardamoms are a spice for which a large market is found in China, and there is some cinnamon in Cambodia; but in general these regions are not productive of the finer spices.

4297. *Cultivation* is very generally diffused, and is conducted in the East on the Indian model, and in the west on the Chinese; but it is not practised in the same perfection, or with the same patient industry, as by either of these nations. The sugar and pepper of Siam are chiefly raised by Chinese settlers. Domestic animals are little used in cultivation, and in Ava the Brahminical principle prevents them from being made articles of food. Animals are tamed chiefly for conveyance or pomp; and for these purposes the elephant, here found in greater perfection, and more highly prized, than in any other country in the world, is chiefly employed.

4298. *Manufactures* exist only on a limited scale, and in a rude form; the raw materials which the country affords being worked up mostly by the family itself for domestic use. Those brilliant and beautiful fabrics which are the boast of China and Hindostan are not produced here, and the quantity used is imported from those countries, especially from the latter. The only fabrication on which much study is bestowed is that of idols, which are fashioned out of a fine species of marble found in the country, and generally gilded; but none are accounted sacred except those constructed at Chagaing.

4299. *The commerce of these countries* is also limited. They produce in abundance all the conveniences and necessities of life, without any of those peculiar products, as the finer spices and the finer manufactures, which attract traders from the most distant parts of the globe. Their chief intercourse is with China, and consists in the exchange of their raw produce, rice, cotton, timber, ornamental woods, varnishes, or some species of the fine manufactures of that great empire. The cotton and other products of the Birman empire are carried up the Irawaddy to a great *jee*, or market, in the frontier province of Yunan. Britain takes of teak timber to the amount of about 200,000*l.*; in return for which, some British manufactures are received. The trade of Siam and Cochin-China is chiefly carried on by Chinese junks coming to the port of Bangkok in the former country, and those of Turon, Hué, and Saigong, in the latter. Mr. Crawford reckons that about 116 junks come annually to Cochin-China, carrying 20,000 tons; and somewhat more than double that number to Siam. There is also some trade with the rising British settlement at Singapore; but these governments have declined all overtures for arranging a regular commercial intercourse.

4300. *Some fishery is pursued on the coast of Cochin-China*, and dried fish forms one of the exports of China. On these shores is also collected a large quantity of gelatinous birds' nests, and of the substance called sea slug, tripang, or *biche de mer*, for which there exists an extraordinary demand in the Chinese market.

SECT. VI. *Civil and Social State.*

4301. *The population of all this range of kingdoms* is a question of extreme uncertainty. Major Symes was informed that the number of cities, towns and villages in the Birman empire amounted to 8000; and this, allowing an average of 1800 to each, would give 14,400,000. This, too, is exclusive of Arracan; so that, altogether, he imagines 17,000,000 to be rather under than above the real amount. This very conjectural calculation, however, appears to Captain Cox over-rated; and his estimate of 8,000,000 is generally esteemed to be nearer the truth. Captain Franklin even reduces it to 5,000,000, and Captain Canning to 4,000,000. Mr. Crawford allows 2,730,000 for the entire population of the kingdom of Siam, of which the proper Siamese are supposed to amount to 1,260,000; the Chinese

settlers, 440,000; the inhabitants of the part of Laos subject to Siam, 840,000; the Malay dependencies, 190,000. This is upon an estimated superficial extent of 190,000 square miles. The same intelligent observer estimates Cochin-China, Cambodia, and Tonquin to contain 98,000 square miles; and, supposing them to be as fully peopled as the neighbouring provinces of China, they would have 5,194,000.

4802. *The people by whom all this territory is inhabited* present several peculiarities of external form. Mr. Crawford even apprehends them to be radically distinct from any other Asiatic race. Their persons are short, robust, active, but devoid of the grace and flexibility peculiar to the Hindoo. Their face, flat, with high cheek-bones, presents the form of a lozenge, and never suggests any idea of beauty. The hair is abundant, black, lank, and coarse; but the beard is scanty, and universally plucked out, which gives them an effeminate appearance. They have a gloomy, churlish, sullen air; a slow, sluggish, and ungraceful gait; but this last part of the description seems nearly confined to the Siamese. Upon the whole, though they borrow the outward forms of life from the Chinese and Hindoos, they are not schooled into that mechanical routine of observance which is so firmly established in those countries. Much greater freedom prevails in the intercourse of society; they are quick, lively, and stirring. The Birmans appear to be an active and intelligent people, possessing in this respect a decided superiority over the Hindoos. The Siamese are said to be sluggish and indolent, destitute of courage, candour, and good faith; and so imbued with national pride, that foreign residents cannot obtain a servant to perform for them the most menial offices. They esteem the lowest Siamese to be superior to the greatest subject of any other nation. They are, however, peaceable, temperate, and obedient to the laws.

4803. *The religion of these countries*, like all others in the East of Asia, is derived from Hindostan; yet, like the rest also, it consists not in the Brahminical doctrine, but in the rival system of Boodh. The name, however, most venerated in all the countries beyond the Ganges is Gaudma, or Goutama; either another appellation of Boodh, or that of one of his most popular disciples. The construction of temples and images of Gaudma forms the grand operation to which the art and industry of all these nations is directed. Frugal and indolent in every thing else, they spare neither cost nor labour on this object. Major Symes considers the grand *kioum*, or monastery (*fig. 643.*), the residence of the *seredaw*,

GRAND KIOUM, OR MONASTERY.

or head of the Birman church, as perhaps the most magnificent structure in the universe. Mr. Crawford observes that the monarchs here erect none of the public works which are common in other countries of Asia,—neither bridges, wells, tanks, nor caravanseras; but bestow all their treasures upon temples. The principal one, at Bangkok, was said, in 1795, to have cost 58,180*l*. The temples, which serve also as monasteries, contain a large space for worship, a depository for the images of Gaudma, a library, and dwellings for the monks or clergy. The materials are by no means very solid, consisting chiefly of brick or mortar: it is on the timber of which the gates and the interior are composed that the expenditure is lavished. These are painted, varnished, gilded, and carved in the most profuse and laborious manner. The principal temple in Ava is about 600 feet in length, and the interior is adorned with upwards of 200 pillars, fifty or sixty feet high, and entirely covered with gold leaf. But the most remarkable of all these edifices is that at Pegu, called Shoemadoo Praw, or the temple of the Golden Supreme (*fig. 644.*). It is raised on two successive terraces, the lower of which is ten feet above the ground, and the upper twenty feet above the lower. The building is pyramidal, composed of brick or mortar, and rises to

the height of 361 feet, without excavation or aperture of any kind; but it diminishes very rapidly as it ascends, so that its form has been compared to that of a large speaking-trumpet. The whole is covered with a *tee*, or umbrella, fifty six feet in circumference, the placing of which forms a high religious ceremony, and gives to the temple its sacred character.

4304. *The framing of the images of Gaudma* ranks as principal of the few fine manufac-

TEMPLE OF THE GOLDEN SUPREME.

tures established in these kingdoms. The chief seat in Ava is Kycock Zeit, a place in the district of Chagaing. The material is a valuable marble found in the neighbourhood, and each image is formed of one single block, and then gilded entirely over. Some of these images, designed for the great temples, are of gigantic dimensions. That of old Ava has a head eight feet in diameter, and measures ten feet across the breast; the hands are upwards of five feet long, and the entire height is twenty-four feet; yet the whole is described as consisting of a single block of marble. An image in the great temple of Siam is said to be still more stupendous. Peculiar sanctity was attached to the Arracan Gaudma,

which, however, was only ten feet high, made of burnished brass, as were the gigantic images of Rakuss, the Hindoo demon, which were also among the spoils brought from that conquered territory. The marble in these images is polished by a peculiar process, which gives it a lustre superior to that which can be bestowed by European artists, and the gold leaf is laid on with great skill. There are about thirty or forty yards crowded with workmen, who are employed in making images of various dimensions and prices. One, somewhat above the human size, might be purchased for twelve or thirteen pounds; while for poor or frugal devotees there were little Gaudmas which could be had for about half a guinea.

4305. *The priests of this religion*, as in all the other branches of the worship of Boodh, are monks residing in the temples, and living in a state of celibacy. In Ava they are called *rhahaans*, in Siam, *talapoins*; but in the latter country, at least, as we are informed by Mr. Crawford, they are bound by no vows, and may quit the order whenever they please; and it is so common to assume and leave the profession, that almost every man has been a *talapoin* for some part of his life, even if only for a few days. Great part of their time is spent in insignificant and even absurd ceremonies; yet their ministration is useful in several respects. They instruct the children in reading, and so diligently, that few in the Birman territory are ignorant in this respect.

4306. *Literature* is by no means unknown or neglected in the Indo-Chinese countries. The Birman language is a compound of the ancient Pali with the Sanscrit, the Tartar, and the Chinese. The difficulty occasioned by this complication is greatly increased by the mode of writing, in which, according to Mr. Judson, "the words are not fairly divided and distinguished, as in western writing, by breaks and points and capitals, but run together in one continuous line, a sentence or paragraph seeming to the eye but one long word; and, instead of clear characters on paper, we find only obscure scratching on dried palm leaves strung together, and called a book." In the royal library, however, the writing is beautiful, on thin leaves of ivory, and the margins ornamented with flowers of gold. The books are kept in gilded and japanned chests. The contents of each are written on the lid in gold letters. The bulk of the works were said to be on divinity; but history, music, medicine, painting, and romance had also their separate treatises. The library appeared very large, and is suspected by Major Symes to be more numerous than that of any monarch from the Danube to the borders of China. The literary character of Siam does not seem so eminent. The talapoins consider it inconsistent with their profession to cultivate any branch of learning except theology. Even medicine is neglected, and the physicians are chiefly adventurers from China. The Siamese have, however, songs, romances, and a metrical chronicle of the country, in 400 cantos, which requires six weeks to recite. With the literature of the more western nations we are little acquainted, but it appears to derive its origin from the Chinese.

4307. *The customs of these countries allow to the female sex a much greater measure of liberty than in almost any other country of the East.* They are neither immured nor veiled, nor withdrawn from the company and conversation of the other sex. This freedom, however, is not accompanied with any disposition to allow them that place in the scale of society which justly belongs to them. They are treated as the mere slaves of the stronger sex; all the laborious duties are devolved upon them, and they manage most of the transactions of buying and selling. Their conduct, at least in Ava, is said to be generally correct, unless as respects a very singular arrangement, into which they are ready to enter with any stranger who comes to reside in the country, even for the shortest period. An unmarried female is then leased out to him, and during that time resides with him as his wife, manages his household, and assists him in carrying on his traffic; but on his departure she must not accompany him, but returns, without any discredit, to her relations, by whom it is probable the arrangement was made. It seems to be connected with the idea of the female being the property of her male relations; and the same traffic is carried on in Cochin-China to a still more scandalous extent. Funerals in all these countries are celebrated with much pomp, and the bodies of the great lie for some time in state: in Ava they are embalmed, while those of ordinary subjects are committed to the funeral pile. Mr. Crawford mentions an odious custom prevalent in Siam, of cutting off pieces of the flesh and feeding birds with them. In Cochin-China a great festival is held on these occasions, which continues for ten or twelve days, and is celebrated with indecent mirth and hilarity.

4308. *The fine arts are not neglected in this region.* The architecture of the temples is an object of great attention, but they are ornamented rather by the profuse expenditure of paint and gilding, than by tasteful or august forms. They do not, as Mr. Crawford observes, possess the solemn grandeur which befits an edifice of this description, and they possess a richness and brilliancy at variance with its character. Vocal music meets with considerable admiration. The females have fine voices, and sing with sweetness, though to very simple tunes, resembling, perhaps, the Chinese. They were unable to follow or relish the varied stream of harmony which flows through an Italian opera. These people are fond of dramatic entertainments; but they have no regular theatres as in Europe. The performers either go to private houses, or perform in public, trusting for remuneration to the voluntary donations of the spectators.

4309. *The habitations in these countries are of slight materials, but commodious.* Bamboos fixed in the ground, and tied horizontally with stripes of rattan, compose the outline, and serve as the supports of the building. Covered with mats they form the walls, and with grass the roof. A spacious mansion can be built in a day, and a tolerable one in four hours. When Major Symes proceeded in his embassy, he had a house erected for him in every place where he was to make any stay. Yet these slight structures are found sufficiently comfortable; and even, if they should be unable to withstand the fury of the elements, their fall is attended with no danger, since the ruin of the whole fabric would not crush a lap-dog. The devastation occasioned by fire, however extensive, is regarded with equal coolness. In the cities of Siam, the houses, built almost entirely along the river, are generally floating upon it, being fastened to the bank by the bamboo rafts. Even the comparatively small number built on shore are raised by posts above the swampy surface of the ground. Mr. Finlayson describes the houses of Cochin-China as built chiefly with mud, and roofed with tiles, and as being large and commodious. About one half consists of an open hall, where they receive visitors and transact business. In the back part of the hall is placed an altar, and other emblems of religion; and the private apartments are disposed in recesses behind. According to Mr. White, they are furnished with hanging chambers, into which air is admitted by wooden gratings, and which are ascended by ladders; but the dwellings of the poor are miserable, and the want of glass must occasion always a great diminution of comfort.

4310. *The dress in these countries exhibits the same contrast as in the rest of the East; that of the poor slight and scanty, that of the rich peculiarly splendid.* The attire of the ordinary Birman females is merely a loose robe or sheet, tucked under the arm, which scarcely serves the purposes of decency; and the working classes are usually naked to the middle. The Birman nobles wear a long robe of silk or velvet, with a mantle and a cap of the same material, which are often richly flowered and embroidered with gold. The attire and all the ornamental articles indicate the rank of the owner, and must on no account be assumed by an inferior class. The use of gold, in ear-rings, large quills and masses, and as the material for the betel box, spitting-pot, and drinking-cup, designates a nobleman of the first rank. The Cochin-Chinese are better clothed than most Eastern nations, being generally covered from head to foot with substantial silk garments.

4311. *For purposes of food, the more western nations, whose institutions are Hindoo, proscribe the use of animals, though various modes are employed for eluding this prohibition.* The Birmans esteem it enough that they do not eat any tame animals, and consider that whatever comes under the denomination of game is lawful provision for the table. Within this range they include lizards, reptiles, and many objects viewed with disgust by

Europeans. The Siamese have contrived to lull their consciences still more easily. They hold it a crime to put any animal to death: but, this sin once committed, and its effects irretrievable, they consider it as a venial offence merely to partake of the flesh. The most scrupulous satisfy themselves with an assertion that the animal has been killed by accident. The more Eastern people, whose habits are Chinese, labour under no such scruples, but, without the same necessity, follow the usage of that nation, in welcoming as food whatever they can take, — rats, mice, worms, frogs. They even feast on the flesh of the cayman or alligator; and a species of white maggot, found in palm buds, is considered as a delicacy fit for the royal table. The entrails of animals and other refuse thrown overboard from the English ships is eagerly collected and eaten by the Cochin-Chinese, whom Mr. White even accuses of having a predilection for filth. In Tonquin the flesh of the dog is said to be eaten, and considered as a great delicacy.

SECT. VII. *Local Geography.*

4312. *The countries between India and China* may be divided into the British territories ceded in consequence of the late successful war; the kingdom of Ava, or the Birman empire; the kingdom of Siam; and the empire of Anam or Cochin-China, comprehending, as already mentioned, Cambodia and Tonquin.

4313. *The territories ceded to Britain* consist of Assam, with some appended territory, the former kingdom of Arracan, the provinces of Yeh, Tavoy, Mergui, and Martaban, extending along the western coast of the Malayan peninsula, and of Malacca itself.

4314. *Assam* is an extensive, somewhat rude territory, to the north of Ava, and the east of Bengal, the possession of which was desired, less from its intrinsic value, than as a barrier to the British possessions. It is bordered on the north by very lofty ranges of mountains, continued from the Himalayah, and watered by upwards of sixty rivers, of which the principal is the broad channel of the Brahmapoutra, which is supposed by some to take its rise among the mountains of Assam. A great part of its surface, thus profusely watered, possesses a luxuriant fertility; yet the rudeness of the inhabitants renders the gifts of nature fruitless, so that nine tenths of its surface consist of desert and jungle. A considerable quantity of gold, however, is found in the sands of its rivers, and, combined with elephants' teeth and coarse silk, affords a certain value for exportation.

4315. *Assam has several rude appendages*; on the east the country of the Garrows, an almost savage race, wildly gay, yet ferocious in war, and even accused of cannibalism; the territory of the Kookies, or Lunctas, also a wild tribe of hunters and warriors; Gentiah, the country of the Kosayah, represented as offering human sacrifices. To the south it has Cachar, a country nearly similar to itself, though somewhat more populous; and south of Cachar, Cassay or Mechley; the people of which are milder and more industrious than any of the above, and bear a greater resemblance to the Hindoos. While attached to Ava, they in a great measure supplied the empire with muskets, and formed the best horsemen in its armies. Munnipore, the capital, was nearly destroyed by the Birmans in the last war.

4316. *Arracan* reaches along nearly the whole eastern coast of the Bay of Bengal, an extent of about 500 miles. The interior is closely bounded by a high mountain range, called Anopetomiein, which consists in a great measure of pestilential marsh and jungle. The plain, however, between the mountains and the sea, the breadth of which varies from ten to one hundred miles, is extremely fertile in rice and other tropical productions. The cultivation, however, being imperfect, it is not supposed to contain more than 100,000 or 120,000 inhabitants. Arracan, the capital, at the mouth of the river of the same name, which forms here a noble expanse of water, is a large city, and the seat of some considerable trade. A new and improving station has been formed by the British at Akyab. By means of boats, betel and other productions of Ava are conveyed down the river, and exported to Bengal. The other chief exports are rice, bullion, salt, bees' wax, and elephants' teeth. Cheduba, a large and very fertile island, Ramree and Sandowy, form districts of Arracan. The worship of Boodh, under the name of Gaudma, is fully established in Arracan; and the Arracan image of that revered being has been mentioned as possessing peculiar sanctity. There are, also, a considerable number of Mahometans, who have been attracted by motives of trade. The native Arracanese are often called, in Bengal, Mug or Mughs, from the term *mogo*, which they apply with peculiar reverence to their priests and great men. Arracan maintained for a very long period an independent existence; yet was subdued without much difficulty by the Birmans, and is now transferred to Britain. Extension of empire was not on this side an object; but the navigation of the bay is thus secured against piracy, and considerable commercial facilities are obtained. The revenues of Arracan, according to the estimate of 1830–31, would amount to 410,000 rupees; the expenses to 190,000.

4317. *The Malayan provinces* extend along the eastern coast of that peninsula, where it continues to border on the Bay of Bengal, and have been long a debateable ground between the Birman and Siamese empires. Their population is thus estimated: — Yeh, 3000;

Tavoy, 15,000; Mergui, 8000; Martaban, 24,000: in all, 50,000. They are not distinguished for fertility, the plain along the sea-coast being soon encroached upon by the range of bleak mountains which stretches along the whole interior of this peninsula; but they possess the finest and most salubrious climate to be found, not only in this empire, but in any part of the East Indies. The sick, in the late war, who were sent thither from Rangoon, experienced a rapid recovery. By means of this coast, also, an opening is afforded into the finest interior provinces both of Ava and Siam. Amherst Town, recently founded on the river Saluen, which forms the boundary between this territory and the Birman empire, will, it is expected, become the seat of an important commerce. The revenue of these provinces, according to the estimate of 1830-31, would be 307,000 rupees; the expenses, 100,000.

4318. *Malacca*, though by the treaty of 1814 it was restored to the Dutch, was, in 1825, ceded to England, in exchange for her possessions in Sumatra. It was one of the earliest settlements of the Portuguese, and continued for a long time to be a great emporium of the trade of the Oriental islands, as well as a place of refreshment for vessels bound to China; but since Prince of Wales's Island and Singapore, under the protecting sway of Britain, have risen to their present importance, the port of Malacca is much less frequented. It has, however, a safe roadstead, a salubrious climate, cooled by a succession of sea and land breezes, with some industry and cultivation, carried on chiefly by Chinese. The population of the town is stated at 4790; that of the country at 33,800. The imports, in 1827-8, amounted to about 134,000*l.*; the exports to 104,000*l.*

4319. *The Birman empire* is formed into two important divisions; — *Pegu*, once its rival, but now its subject kingdom, which comprises all the sea-coast and the mouths of the rivers; *Ava* or *Birmah*, occupying the upper valley of the Irawaddy, and the present seat of the ruling power. *Pegu* is a sort of delta, entirely traversed by the alluvial branches of the Irawaddy, *Pegu*, and *Saluen* rivers. Its valleys are of extreme fertility, and particularly productive of rice; so that it serves as a sort of granary to the empire. It has also spacious forests, abounding in teak, which requires a soil at once moist and rich. *Ava* consists of a plain of less extent, closely hemmed in by mountains, and by no means of equal fertility; but it is also well cultivated, abounds in timber, and its brave and hardy inhabitants have generally held in their hands the supremacy over both nations.

4320. *Rangoon*, the grand emporium of the empire, is situated on one of the branches of the river of *Pegu*, and extends for about a mile along the water. It is not so well built as the capital, and, indeed, to the members of the late expedition, it appeared little better than a huge assemblage of wooden huts. The custom-house is the only edifice in the town that is built of brick. The population, however, is estimated by Major Symes, from the number of houses, which is 5000, not to fall short of 30,000. It is composed in a great measure of foreigners from all the countries of the East, and of all religions, who have been encouraged to settle here by the liberal policy of the Birman government. The exchange presents a motley and confused assemblage of Mahometans, Parsees, Armenians, and all the commercial tribes of the East. The chief ornament of *Rangoon* is the great temple of *Shoe Dagon*, or *Dagoung*, which, though not quite so elevated as the *Shoemadoo* of *Pegu*, is as highly ornamented, and contains in its precincts 1500 *rhahaans* and other religious persons employed in the service of *Gaudma*.

4321. *Pegu*, the ancient capital, was reduced, after the conquest, to a state of complete desolation. *Alompra* rased every dwelling to the ground, demolished the walls, which from their fragments appear to have been thirty feet high and forty feet broad, and spared only the praws, or temples. For some time, the only object was to terrify the *Peguese* into submission by the most severe examples. The present king, adopting a milder policy, has made it his main object to conciliate his *Pegu* subjects. For this purpose nothing was so grateful as to allow them to rear again their fallen capital. The scattered inhabitants have been invited to return, and new settlers have been encouraged by liberal grants. The residence of the *maywoon* or viceroy has also been removed thither from *Rangoon*. Possessing, however, neither the splendour of a royal capital, nor a commodious site for extensive trade, *Pegu* has attracted only a small proportion of its former crowded population. Major Symes does not suppose it at present to contain more than 5000 or 6000.

4322. Many important places occur, in ascending the river, before we arrive at the capitals of *Ava*. *Meyahoun* is an ancient *Pegu* city, the splendour of which is marked by numerous gilded spires and spacious convents. The surrounding country is so fertile, especially in rice, as to render it almost a granary of the kingdom; and large depôts of grain are maintained here by the sovereign. *Prome*, the ancient frontier of *Ava* and *Pegu*, and at one time a residence of the *Pegu* kings, carries on a great trade in timber, and is said to be somewhat more populous than *Rangoon*, but contains no edifices of remarkable splendour. A continued succession of towns and villages, among which *Meeaday* is the most important, continues till we arrive at *Pegassin*, or *Paghan*. This city, the ancient and splendid capital of *Birmah*, at a time when a higher taste in architecture appears to have prevailed than at present, abounds with magnificent remains of temples and royal edifices.

4323. *The capitals of Ava* are situated nearly at the termination of the plain of the *Ira-*

waddy, after it has taken an easterly direction, and begun to be contracted by the upper mountains. The original capital, bearing the national name of Ava, or Aungwa, was quitted by Alompra for Ummerapooa, and exhibited to Major Symes that aspect of desolation which always covers an Asiatic capital from the moment it ceases to be the residence of the court. The slight wooden materials of which the palaces of the grandees consist were easily transported to the new metropolis. The walls were mouldering in decay; ivy was clinging to their sides; thorns, bamboos, and a few plantains, allowed to grow unmolested, covered the greater part of its site. Only the temples were left untouched, and were sinking under the silent operation of time. Sailing upwards about twenty miles, through a continued succession of houses and villages, the traveller was cheered by the majestic spires and turrets of the new capital, rising amid a wide expanse of water, which, when the river is high, surrounds it like a lake. The principal part of Ummerapooa is the fort, or rather fortified city, more than a mile square, and within whose precincts are contained all that is splendid and that belongs to the court in Ava. The magnificence of the palace consists chiefly in its halls, adorned with gilded pillars, and white silk umbrellas bespangled with gold, while the enclosing walls are merely of brick. But the temples are most profusely ornamented without, as well as within; and their lofty spires or *piasaths*, richly gilded or burnished, make a magnificent appearance. Captain Franklin estimated the inhabitants at 175,000 from the official number of 25,000 houses, allowing seven to each house; but as the houses had been enumerated with a view to taxation, the number was probably under-rated. But it is finally to be stated, that what Ummerapooa lately was, Ava now again is. In 1824, the seat of empire was transferred back to the old capital, which soon doubtless became the centre of Birman splendour; and the majestic edifices of Ummerapooa are now mouldering in ruin.

4324. *The interior details of Siam* are known only to a very limited extent. The early capital, Yuthia, was abandoned after the Birman conquest, when Piatac, a chief of Chinese origin, reared again the standard of Siamese independence. He then transferred the capital to Bangkok, farther down the river, and more favourably situated for trade. Bangkok may be regarded almost as a city floating in the water. The houses are little more than large wooden boxes, of an oblong form, extremely neat, and thatched with palm leaves. They extend in rows eight or ten feet from the bank, to which they are fastened by long bamboos. They are divided into several small apartments, the most central of which is assigned to the household gods; while in front of many is raised a platform on which is spread rice, fruit, and other articles, forming a species of floating bazaar. These habitations, though diminutive, are said to be tolerably comfortable, and can, of course, be moved with the utmost facility

from one place to another. Each house has a boat belonging to it, which is almost the only vehicle for moving through the city; and the habit of continual rowing gives to the arms both of men and women a disproportionate size. These floating mansions are chiefly inhabited by Chinese, who appear to form the majority of the inhabitants of Bangkok, and monopolise almost every department of trade and industry. The chief trades are those of blacksmith, tinsmith, and currier, which, by a singular conjunction, are in the hands of the same person. The tin vessels are highly polished, and the leather, dyed red, is used, not for shoes, but for pillows and mattresses. The Chinese, from these occupations, derive a very handsome livelihood, and live plentifully and grossly, on pork, oil, and fat; consuming more value in food in a week than the Siamese does, or can afford to do, in two or three months. The shore, meantime, is covered with numerous palaces and gilded temples (*fig. 645.*), and with the habitations of the grandees, raised by posts above the ground, which is yet so swampy as to render it scarcely possible to walk or drive through the streets. The travelling is chiefly along the river, in richly gilded and ornamented barges.

SPIRE AT WATANAZA.

4325. *Chantibond* forms the most eastern district of Siam, and is in some respects superior to the flat and alluvial plain which immediately borders the river. Situated on the slope of the mountains which separate Siam from Cambodia, it forms a hilly and romantic region, covered with noble forests, and abounding in valuable aromatic plants. Pepper is the most important object of cultivation, being produced to the annual amount of 20,000 peculs, and capable of almost indefinite augmentation. Cardamoms, though not equal to those of Cam-

bodia, are produced for the Chinese market. The forests contain some very fine odoriferous woods. The population has been supposed to amount to nearly a million, the most numerous and industrious part of which is Chinese.

4326. *The coasts and rivers of Cochin-China and Cambodia* are of different aspect: they are not bordered by the same vast extent of fertile and alluvial territory. Almost the whole coast of Cochin-China is composed of steep cliffs, which, from their rugged forms, and the sharp pinnacles in which they terminate, appear to consist of granite, and between which and the sea there is scarcely a level interval. From their coves, indeed, are seen issuing fleets of boats, which give the idea of industry and plenty; but a nearer inspection shows them to be miserable in the extreme. These little barks are composed chiefly of split rattan, with bamboos for masts, the bark of trees for tackling, and mats for sails. They form the whole habitation of their occupants, whose entire property is embarked in them, and who have no food except the fish which can be drawn from the waters. The great rivers which traverse these two countries, though they descend from fertile and smiling valleys of the most romantic aspect, are hemmed in at a short distance by mountains of the same peaked and rugged character as those which border the coast. Although, therefore, these rivers are as ample as those of Siam, the valleys include not nearly the same extent of fertile and productive land.

4327. *Hué, the capital of Cochin-China*, is situated on the river, about ten miles above its entrance into the fine bay of Turon. The scenery of this stream appeared to Mr. Finlayson the most beautiful and interesting he had seen in Asia. A fertile valley, covered with the cocoa nut, the banana, the sugar-cane, and elegant hedges of bamboo, is bounded by the lofty mountains already described. The view of numerous and apparently comfortable villages enlivens the scene. Hué consists of a large quadrangular fort, or rather fortified city, which constitutes one of the most complete and remarkable military structures in Asia. Each side is about a mile and a half in length, the rampart about thirty feet high, cased with brick and mortar. It is built in the regular European style, with bastions, a glacis 200 feet broad, and a ditch. An hundred thousand men were constantly employed in the works, during the period of their construction, and 1200 cannon were mounted on the walls. It is supposed that 40,000 troops would be required to garrison the place. Here also the king keeps his fleet of galleys.

4328. *Saigong, the capital of Cambodia*, is situated near the mouth of the noble river of Donnai. It consists of two closely contiguous parts, called Saigong Proper and Bengéh. The latter is fortified, and is the residence of the viceroy; but Saigong Proper is the chief theatre of trade, and conducts entirely that of the fine valley in which it is situated. The united city is described by Mr. Finlayson as very large; each of its parts appeared to him equal to the capital of Siam: and Mr. White reports, from official documents, the population of the whole to amount to 180,000, of whom 10,000 are Chinese. The markets are plentifully supplied with native products and those of the neighbouring countries. The manufactured articles are chiefly of the latter description, and scarcely any European goods are to be seen. There is a superb naval arsenal formed under European direction, and which, from the very fine timber of the country, has produced 150 galleys of the most beautiful construction.

4329. *Tonquin*, of the three kingdoms now subject to the sway of Cochin-China, is the largest, most fruitful, and most valuable. Its character is still more decidedly Chinese than that of the others; and, indeed, it was only in the fourteenth century that it separated from that empire, retaining all its forms and institutions. Both the English and Dutch have attempted to open an intercourse with Tonquin, where fine and cheap silks, lacquered ware, and some gold, may be obtained; but the arbitrary exactions of the mandarins, and the little demand for foreign cloths, in consequence of costumes fixed by law being worn by all the orders, rendered it a losing traffic, and it has been almost wholly abandoned. Ke-cho, situated about twenty miles from the mouth of the great river of Tonquin, has been said by one traveller to contain only 40,000 inhabitants; but Mr. Crawford understood, what is indeed probable, that it is larger than any city either of Cochin-China or Cambodia; in which case the above estimate must be greatly under the truth. We want the information of some recent and intelligent traveller respecting Tonquin.

CHAP. VIII.

CHINA.

4330. *This vast empire*, containing the greatest amount of population, and, perhaps, also of wealth, united under one government, occupies a large portion of the south-east of Asia.

SOUTH PART.

SECT. I. *General Outline and Aspect.*

4331. *China* composes a broad expanse, nearly square, two sides of which are bounded by sea and two by land. The sea is the great Pacific Ocean, which, however, does not here present a well-defined outline, but is broken into great gulfs. Of these, the chief is denominated the Sea of China, enclosed by Borneo, the Philippines, and Formosa; and the Yellow Sea, bounded by Tartary and Corea. The interior boundary consists of a range of thinly peopled tracts, occupied only by wandering and barbarous tribes, Mandshur Tartars, Mongols, Kalkas, Eluths, and the eastern tribes of Great Thibet. These regions have usually given rulers to China; but at present the empire, or, at least, its reigning dynasty, comprehends within its sway upwards of 1000 miles in every direction of these rude territories. It holds them, however, as tributaries only, or under loose military occupation, and without any attempt to impose on them the police, the laws, or the general character of China itself. At the same time, the whole of this vast frontier is guarded with equal care against the approach of foreigners. Communication is left open at two solitary points: only one, the port of Canton to the maritime nations of Europe; the other, Maimatchin, on the Siberian frontier, to the subjects of Russia. The south-western angle alone touches upon civilised territories, partly the Birman empire, partly Tonquin, now included in the empire of Anam, or Cochinchina.

4332. *China Proper*, now exclusively under consideration, may be generally stated as extending from 20° to 41° of north latitude, and from 101° to 122° of east longitude. This makes 1260 geographical miles in length, by 1050 miles in breadth. According to an official statement presented to Lord Macartney, and which might probably approach the truth, the superficial extent amounted to 1,298,000 square miles, or about eight times the dimensions of France. Of this vast surface, the greater part consists of a level plain, alluvial, and sometimes marshy, but in general capable of the highest cultivation, which it actually receives.

4333. Close observers, however, have traced considerable *chains of mountains* traversing the empire. Of these, the most important seems to be that which runs through the southern provinces, and forms a continuation, though on a much lower scale, of the Great Himalayah. In Yunan, on the eastern frontier, where it first enters the empire, its ridges, which appear to be very steep and lofty, nourish bands of lawless and predatory tribes. But in the eastern provinces, their pinnacles seldom rise above 3000 or 4000 feet; and, being covered with noble forests, crowned with pagodas, and with cities along their sides, they give to the country a magnificent aspect, without interrupting its culture and populousness. The ground also rises rapidly as it approaches the northern frontier, which is formed or crossed by mountains of considerable height, and over which that stupendous bulwark, the Great Wall, has been carried with incredible labour. These chains also, according to Chinese maps, which form here our only authority, penetrate at different points into the interior provinces.

4334. The pride of China, and the exuberant source of her wealth and fertility, consist in the *mighty rivers* by which, through its entire breadth, the empire is traversed. The two great twin streams of the Hoang-ho, or Yellow River, and the Kian-ku, or Yang-tse-kiang, rise from distant and almost unknown sources in the heart of Tartary. The former, as it enters China, is bent by the frontier mountains into a northerly course, which it follows for several hundred miles, until it reaches the desert depths of northern Tartary. Fortunately for China, it then again bends, and, after making a circuit, flows, opposite and parallel to its former course, into the interior of the empire, and fertilises several of the finest provinces in its progress westward to the Yellow Sea. Its banks here are entirely alluvial, and the quantity of mud and earth brought down with it give its waters the appearance of diluted clay. According to Mr. Barrow, it pours into the sea, every hour, 2000 feet of solid earth, sufficient in seventy days to accumulate an island of a mile in circumference; and, in fact, the depth of the Yellow Sea has been observed very sensibly to diminish. The Yang-tse-kiang rises in Thibet, very near to the Hoang-ho; but in approaching China it takes a great contrary bend to the south, till it is at one point about 1000 miles distant from the other. Then, bending northward, it approximates to the Hoang-ho, and, after watering all the great central provinces, reaches the sea by an estuary scarcely 100 miles distant from it. The two rivers appear each to flow upwards of 2000 miles; but the Yang-tse-kiang is rendered the noblest, both by the magnitude of its stream, and by the superb cities with which its banks

are adorned. It is called by the Chinese "the first-born of Ocean," and appears to be without a rival, unless among the waters of the New World. Both have great and numerous tributaries, which serve important purposes of commerce and irrigation. The Peiho, or river of Pekin, the Kan-kiang, and the river of Canton, afford also valuable means of internal communication.

4335. *Of lakes*, China comprises in its central region the Tongting, about 300 miles in circumference, and covered with a numerous population who subsist by fishing; the Poyang, surrounded by picturesque and finely wooded hills, and by considerable cities; with several others of less magnitude; but these, on the whole, do not cover any very great proportion of her vast surface.

SECT. II. *Natural Geography.*

SUBJECT. 1. *Geology.*

4336. *The Geology of China* is unknown. A few facts, in regard to its minerals, occur incidentally in books of travels and works on the statistics of that vast empire. Rubies, corundum, topaz, tourmaline, lapis lazuli, jasper, agate, jade, marble, porphyry, granite, syenite, are enumerated among the precious and ornamental minerals. Earthy felspar or kaolin, an important ingredient in the manufacture of porcelain, occurs abundantly in some parts of China; and beds of coal are described as extending through considerable tracts in the northern parts of the country. *Gold* is obtained from the sand of rivers in the provinces of Se-tchuen, and Yunan, near the frontiers of Thibet. *Silver* in the native state, and also combined with sulphur, antimony, and lead, or as ores, occur in considerable abundance; but no mines of silver of importance are mentioned. No gold or silver money is coined. The *tutenague* is a white metallic substance, of which the Chinese make vessels and chandeliers. The *copper pyrites*, or yellow copper ore, of Yunan and other provinces, is used for making small coin, which is current throughout the whole empire. The *pa-kfong*, another ore of copper, is also extensively worked. *Lead* and *tin*, it is said, occur much less abundantly than copper: that which is exported from Canton comes from Thibet and Japan. Mines of *mercury* abound in Yunan. *Realgar*, or native sulphuret of arsenic, is employed by the Chinese, in blocks, for making pagodas and vases.

SUBJECT. 2. *Botany.*

4337. *China*, situated between the 21st and 42d degrees of latitude, and the most easterly longitude of any part of the Old World, possesses a temperature which will appear very low, by comparison with that of the corresponding western countries that are washed by the Atlantic Ocean.

4338. *From this circumstance*, and from a reference to the notes relative to the vegetation of China which are scattered in the writings of travellers, we shall admit that the Equatorial Flora of China does not extend beyond the 27th parallel, even under the most favourable circumstances. If this idea be entirely correct, the chain of the Milin mountains, which runs from west to east for upwards of 1000 miles, and then turns abruptly to north-east when within a short distance of the sea, dividing from the rest of the empire the southern provinces of Yunan, Koang-si, Canton, and the eastern province of Fo-kien, marks the termination of the Equatorial and the commencement of the Transition Zone.

4339. *With regard to temperature*, M. de Humboldt, on grounds unknown to us, states the mean of Canton to be $+ 22^{\circ} 9'$. He observes that the thermometer sometimes sinks to zero, and that, by the power of radiation, frost sometimes forms on the terraces of the houses. The latter assertion is confirmed by the remarks of Lord Macartney and of Krusenstern. The English embassy, arriving in Canton in December, 1793, found that a fire in the chimney was by no means unwelcome, and thirteen years afterwards, in the same month, Krusenstern saw that ice was selling in the streets. These colds are instantaneous; and do not prevent the vegetation from being entirely equatorial.

4340. *Among the most remarkable families* of plants in the southern provinces, we shall enumerate the Palms, the Laurel, and Caper tribes, the Menispermæ, Malvaceæ, Bombaceæ, Camellias, Ternströmiaceæ, Aurantiaceæ, Sapindaceæ, Magnoliaceæ, Terebinthaceæ, Rhamnæ, Leguminosæ, Myrtaceæ, &c. - The cultivator grows together, the Banana, Guava, Orange, Papaw, Cocoa, Litchi, Tea, Sugar-cane, Peach, Apricot, Vine, Pomegranate, and Chestnut; but the latter seldom produce good fruit. This combination of the trees of India and Asia Minor may also be observed on the western coast of the Isle of Formosa, between the 22d and 25th degrees of latitude.

4341. *Few of the vegetables* of the Equatorial Zone are seen beyond the Milin mountains. The northern side of these mountains, sometimes rocky and barren, in other places overshadowed with large forests of Oak, Hornbeam, and Poplar, are subject to long and severe winters, during which the valleys are covered with snow. Between these mountains

(lat. 25° to 27°) and the Yellow River (lat. 35°), vegetation presents all the peculiarities of the Transition Zone. Various species of Orange, Lemon, Tea, Sugar-cane, Rice, and Pomegranate, the Black and White Mulberries, the Vine, Walnut, Chestnut, Peach, Apricot, and Fig, are grown on the same spot; but neither the Palms, Banana, Guava, Papaw, nor any other species which requires the steady and continued heat of the equatorial regions. The plains produce a species of Bambusa, the Phyllanthus Niruri, the Pride of India (*Melia Azedarach*) (fig. 647.), and *Stillingia sebifera* (fig. 648.), which yields a kind

647

MELIA AZEDARACH.

of wax that is manufactured into candles by the Chinese, the *Thea chinensis*, several *Camellias*, among them the *Sasanqua* (from which they extract an oil of very inferior quality to that of *Olea europæa*, which is unknown to them), the *Olea fragrans*, *Sophora japonica*, *Sterculia platanifolia*, *Ailanthus glandulosa*, *Vitex incisa*, some *Clerodendrons*, *Mimosas*, *Neriums*, and *Rhamni*, the Horsechestnut, the *Abies orientalis* and *Pinus Massoniana*, probably also *Pinus longifolia* and *P. Pinea* (for we sur-

648

STILLINGIA SEBIFERA.

mise this latter to be the fir tree, from the large cones of which, the Chinese were seen, by Staunton to collect, and eat eagerly the kernels), different kinds of Juniper and Cypress, the *Cunninghamia lanceolata* (fig. 649.), *Podocarpus macrophylla*, *Thuja orientalis*, Sallows, &c.

649

CUNNINGHAMIA LANCEOLATA.

4342. On the lovely banks of the Yang-tse-kiang, or Blue River, and of the southern streams which swell its waters, the Camphor tree, the *Stillingia sebifera*, the Chestnut and Bamboo (that giant of the Grass tribe), grow together, with the Pines, *Thuja*, and Cypress, whose dark hues and uniform aspect contrast strikingly with the rich, brilliant, and varied vegetation which surrounds them. The *Nelumbo*, or Sacred Bean of India (*Cyamus Nelumbo*), displays its superb flowers on this river. The Bamboo forms forests in Tche-kiang (lat. 29° to 30°), and with the Pine follows the boundaries of Kiang-si (lat. 24° to 30°), and of Kiang-nan (lat. 25° to 30°). The whole zone abounds with Coniferæ, and the mountains are adorned with Pines, or, at least, with large trees bearing so close an affinity with them, that a botanist alone could

point out the difference. In Kiang-si, whole hills are covered with *Camellia Sasanqua* (fig. 650.); while those which encircle the town of Thong-kiang (lat. 29°) are crowned

650

CAMELLIA SASANQUA.

with Orange trees. This tree, with the Lemon, is still seen at Koue-te-fou (lat. $34^{\circ} 30'$), on the right bank of the Yellow River. Every where the Tea plant grows in the hedges. Staunton, the editor of Macartney's Travels, assigns lat. 30° as the northern limit of this shrub; but he is in error: it grows much farther. The leaves are gathered at Tchang-tchou-fou, in lat. 32° , and, if Linnæus be correct, also at Pekin; which does not seem improbable, though there is no positive confirmation of the statement, since Kæmpfer avers that it is found in the vicinity of Jeddo, in the Japanese island of Nippon, where the temperature in winter must be very low. Supposing the fact to be correct as stated by Linnæus, it will afford an additional proof of what the influence of summer heat can effect in fortifying against the cold of winter. The Sugar cane has not been traced farther north than lat. 29° or 30° ;

which is in Se-tchuen, a western province, bounded by the mountains of Thibet, and probably colder than the maritime districts in the same latitude; which induces the belief that the Sugar-cane is probably cultivated more to the north, in Tche-kiang and Kiang-nan. In the more northerly parts of China, winter displays many of its characteristics in the course of the seasons. In lat. 30° , near the port of Hing-pe, *Stillingia sebifera* sheds its leaves in November. A degree and a half north of this place, at the mouth of the Blue River, winter prevails for a fortnight, during which snow falls nightly, and melts at the first rays of the sun. Bouvet, an eye-witness, relates that in February, 1688, at seventy-five miles from the sea, in lat. 34° , the snow fell, and the Hoang-ho, or Yellow River, was obstructed

with ice, the latter having probably been brought by the water from a higher part of the country. It seems incontestable that in Pe-tche-li, which does not extend beyond lat. 42° , but which rises gradually from the Hoang-ho and the Yellow Sea to the Great Wall, the rivers are frozen from the end of November to the middle of March; and that, at Pekin (in lat. $39^{\circ} 54'$), the winters are very severe, though the Oleander, the Vitex Negundo, and the Sacred Bean of India grow in its environs.

4343. The above-stated facts warrant the taking of the Yellow River and the Hoü-ho River as the line of separation between the Transition and the Temperate Zones.

4344. After the above extended remarks, from the laborious Mirbel, on the general vegetation of China, it cannot be supposed that we shall enter at large upon the few interesting species which are familiar to us, either from their use or their beauty, whence they have recommended themselves to general culture in our green-houses and conservatories; among which will rank pre-eminent the Camellias, with the almost unlimited variations of *C. japonica* (fig. 651.). The Sugar-cane (*Saccharum officinarum*), though so extensively cultivated in the West Indies and elsewhere, is considered to be a native of China. The same may perhaps be said of the Orange.

CAMELLIA JAPONICA.

Rice (*Oryza sativa*), equally distributed through the warmer regions of the Old and the New World, is perhaps more generally grown in China than in any other part of our globe; and the name is applied to a Chinese production, a most delicate material for drawing upon, and for manufacturing artificial flowers, known under the appellation of Rice Paper, from an incorrect notion, perhaps, that Rice was employed in its composition. But if this paper be held up between the eye and the light, an exquisitely beautiful cellular tissue is discoverable, such as no art of man could produce or imitate. It was, then, a subject of much gratification to us, that our late friend, Dr. Livingstone, surgeon to the Factory at Canton, favoured us with a specimen of the paper, enclosing a portion of the stem of the plant from which it is cut. The latter is evidently herbaceous; the piece is about four inches long, hollow in the centre, with a mem-

branous transverse septum at each end, so that it appears to be the joint of a stem. The diameter is about an inch, and the thickness of the parenchymatous substance is little more than half an inch, but of the purest possible white. This piece might, therefore, be cut into a sheet or leaf, though only of four inches in length, yet of considerable breadth: for it would of necessity be cut in such a manner as to unroll like a scroll of common paper.

4345. The cutting of this material into leaves or laminæ is not performed by transverse sections, but made vertically round the stem. The most perfect stems are selected for this purpose; few, however, being so free from knots as to produce a cutting more than nine or ten inches long.

4346. It was Dr. Livingstone who first brought from China to Europe a quantity of this substance, which he presented, about 29 years ago, to Miss Jane Jack, who was celebrated for the beauty and accuracy of her artificial flowers. Formed of rice paper, they obtained additional celebrity, fetched very high prices, and were eagerly sought for by persons of the greatest rank and most acknowledged taste. For a bouquet which Miss Jack presented to the late Princess Charlotte she received the regal present of 70*l*.

4347. When Dr. Livingstone first procured the rice paper from the Chinese, the pieces did not exceed four inches square; they were dyed of various shades and colours, and cost about 6*d*. each square. Since that time the price has been much reduced, and the size of the pieces increased, so as to be upwards of a foot long and five inches across, and preserving their natural whiteness. The tinted pieces are employed by the Chinese for their artificial flowers, and the plain white for making drawings upon. Now, this material is so much esteemed in Europe, that it is in request with all persons who visit Canton.

4348. It is to be regretted that the plant producing this curious and beautiful material is not known to botanists; for we are satisfied that, in the *Botanical Miscellany* (vol. i. p. 90.), two substances are confounded under the name of Rice paper, the soft and spongy stems of the *Æschynomene paludosa* (called Shola in Hindostan, and described at page 963. of this work), and the stems producing the substance in question, which are of a far more delicate texture, peculiar, we believe, to China, and, as far as can be judged from a drawing which has been communicated to us, belonging to the Malvaceæ; an opinion, as we think, also entertained by Professor Lindley.

4349. Tea is a vegetable which has lately risen into such infinite importance to mankind, and which is so restricted, in its still extended cultivation, to China and its dependencies, that we should hardly be excused did we not offer some remarks upon it. Two kinds of Tea plant are commonly cultivated in our green-houses; the one under the name of *Thea viridis*, or Green Tea, the other of *Thea Bohea*, or Black Tea; and which appellations

had been given them, partly, as it would appear, on account of the relative colours of the foliage, and partly under the impression that the former produced the Green Tea of the shops, and the latter the Black Tea. But this idea seems to be founded upon no good authority, as we shall presently show; and even with regard to *T. viridis* and *T. Bohea*, botanists are by no means agreed as to their specific identity: indeed, a general opinion now prevails that they are mere varieties; an opinion, however, in which we do not coincide. *Thea viridis* is a large, strong-growing, almost hardy plant, with its branches spreading, its leaves three to five inches long, very broadly lanceolate, pale green, singularly waved, the margin reflected: the flowers are large, solitary, mostly confined to the upper axil: they appear in the autumn six weeks or two months earlier than those of *T. Bohea* (*fig. 652.*):

while the latter is of smaller size, with remarkably erect stiff branches, leaves not above half or two thirds the size of the former, perfectly flat, more coriaceous, dark green, bearing, in the axils of numerous leaves, two or three flowers, which are smaller and have a slight fragrance, and are in perfection during winter. It will not endure our frosts. Both kinds are indeed so frequent in our collections, that every one has the opportunity of examining them and exercising his own judgment as to the importance of their characters. The difficulty is much greater in determining which of these species is the one cultivated in China: whether both may not be employed in the production of the different kinds of Tea, or whether they may not be indiscriminately used: for the Chinese are exceedingly jealous over the processes employed in the preparation of Teas; and, the Tea country being at a great distance from the European Factory, it is very doubtful if any scientific person has, from actual personal observation, been able to decide the question. An assertion is, indeed, (and, per-

haps, rather too hastily,) made in the *General System of Gardening and Botany*, namely, that "all the different kinds of teas brought to this country from China are the produce of *Thea viridis*;" and again, under *Thea Bohea*, "This is falsely called Bohea Tea; as we find the Bohea teas of the shops, as well as other kinds, both green and black, to be the leaves of the former species, *T. viridis*." Dr. Abel, in his *Narrative of a Journey to the Interior of China*, satisfactorily notices the two kinds of tea plant under consideration, and he adds, "from persons conversant with the Chinese method, I learned that either of the two plants will afford the black or green tea of the shops; but that the broad, thin-leaved plant (*T. viridis*) is preferred for making the green tree." This statement is corroborated by our valued friend, Charles Millett, Esq. of Canton, who holds a high official situation in the Company's Factory there, and to whom we wrote to request information on the subject. "The Tea plant," he says, "is almost as scarce in the neighbourhood of Canton as it is in England. The tea country is at a great distance from hence, and the teas brought to Canton are several months on their route by inland navigation. Of the plants there are two kinds; of which one has a leaf of a much darker green than the other. This difference may partly arise from cultivation; but it is to the various modes of preparation, that the *green* and *black* Teas (as they are called in England) of commerce, are due. In proof of this, we sent home, last year, Green Tea from the Black Tea plant: you may, therefore, conclude, that though there are two plants, differing as much in appearance and growth as any two varieties of the *Camellia japonica*, each, by proper management, will produce black or green Tea indifferently. The varieties of teas from the several provinces arise from soil, culture, mode of preparation, and, above all, from the part of the shrub whence the leaves are pulled. From the same individual plant, indeed, there are three crops or gatherings annually; the first affords the finer teas, of which the Pouchong is the produce of the larger leaves on the young shoots. The extreme shoots, with the opening leaf buds, constitute the Peko. This is, in England, commonly supposed to be the flowers: but an examination, after infusion, will clearly show its origin. The first picking takes place in June, the second in July, and the third in August."

4350. We may add, that Kæmpfer's figure of the Japanese Tea plant, which is evidently the plant in general culture in that empire, is the *Thea Bohea*, not the *T. viridis*.

4351. The native country of both the species, is, probably, various parts of China; and the cultivation seems to be confined to the Temperate Zone, extending to the northern provinces of the Empire, and as far as lat. 45° N. in Japan. But the Tea districts, properly so called, are thus stated by Dr. Abel:—that of the Green Tea is in the province of Kiang-nan, between 29° and 31° N. lat., at the north-western base of a ridge of mountains, which divides the provinces of Tche-kiang and Kiang-nan: the Black tea district, in the province of Fo-kien, is contained within lat. 27° and 28° N., and is situated on the south-eastern declivities of a ridge of mountains dividing the province of Fo-kien from that of Kiang-si.

4352. *The different kinds of tea of commerce*, as known to us in Europe, are not very numerous: but the Baron de Schilling has given the names of thirty-six sorts, copied from a Chinese MS. in his possession. Some of the appellations are very curious. The Black or Bohea Teas, if we may judge from their names, are most esteemed; such as Lao-kiun-mei, or "*venerable old man's eyebrows*;" Pekao, "*white hairs*," "*palm of the immortals*," &c. The leaves of some kinds are used to dye stuffs black, others of a golden colour. All the different sorts of tea may be distinguished, by the experienced merchant, merely by the taste. The situation of assayer of teas at Canton requires this sort of faculty: and the individual who holds it enjoys a salary of 1000*l.* per annum for tasting teas only!

4353. *The quantity of tea* produced in China must be enormous; for, with the exception of Japan, it has not been found practicable, though often attempted in Brazil and elsewhere (and mainly on account of the higher price of labour), to cultivate it to advantage any where but in China Proper: and there the Tea plant is spread, and not very thinly spread, over a square area of 1,372,450 square miles. It is now a common beverage throughout the whole civilised world. Its use in China reaches to a very high antiquity. An Indian prince, according to the Japanese, a holy and religious character, of the name of Darma, visited China, about the year 516 of the Christian era, with a view to instruct the natives in the duties of religion. He led a life of great abstinence, and denied all manner of rest or relaxation to his body; but he was at length so weary of his fatigues and fasting, that he fell asleep. As a penance for so great a dereliction from duty, he cut off both his own eyebrows, the instruments and ministers of his crime, and threw them upon the ground: each eyebrow became a shrub, and that shrub the one now called Tea; whose virtues were, till then, as unknown to the world as the plant itself. Darma quickly discovered the agreeable properties of the foliage, which endowed his mind with fresh powers to pursue his divine meditations. Having recommended the use of it to his disciples, it soon became general in China, and has now extended to the remotest regions of the earth: while the individual who first discovered its qualities is held in remembrance by a rude figure, in Chinese and Japanese drawings, of an old man standing upon water, with a reed under his feet, and one of his eyebrows sprouting out into a tea leaf.

4354. *Linschot is said to be the first traveller* who tells of an herb with which the Japanese prepare a drink, and which they offer to their guests as a mark of high consideration. Caspar Bauhin speaks of it, in his *Pinax*, under the name of *Cha*. It was very early in the 17th century that tea first became known in Europe; and we are assured that the Dutch at first carried on a trade, by recommending the Sage of this country, which they gave in exchange for Tea of China. The use of the former soon ceased; while that of the latter daily increased among us. Little more than a century ago, according to Lord Macartney, the English East India Company did not sell more than 50,000 lbs. of tea, and very little was smuggled. In 1784, the consumption of Great Britain was estimated at 1,333,814 lbs.: now, that of Great Britain and Ireland, exclusive of the dependencies, amounts to more than 28,000,000 lbs.

4355. *Lords Arlington and Ossory* brought home a quantity of tea from Holland, about the year 1666, at which time it was sold for 60*s.* per lb. But the practice of tea-drinking, even in public coffee-houses, was not uncommon in England prior to that period; for, in 1660, a duty of 8*d.* per gallon was laid on the liquor made and sold in all coffee-houses.

4356. *In the sister country of Scotland*, a century more elapsed before tea was generally known. It has been stated, and, we believe, on the authority of Sir Walter Scott, as proving how long a time had passed before tea came into common use in his native land, that people are yet living who recollect how the Lady Pumphraston, to whom a *pound of fine green tea* had been sent as a rare and valuable present, boiled the same, and served it up with melted butter, as condiment to a salted rump of beef, and complained that no cooking she could contrive "*would make these foreign greens tender!*"

4357. *America carries on a vast trade* in this article: but Russia is stated to rank next to Great Britain, inasmuch as 25,200,000 lbs. of tea are yearly imported and consumed by the Russians. Their trade with the "*celestial empire*," as may be conjectured by the proximity of their territories, is by land: and it is said, that, in consequence of it, the tea is of a superior quality to that which has been subjected to a long voyage. It is sent from Russia to Germany, where it fetches a high price, under the name of Caravan Tea. But, in Russia, a peculiar kind of tea, not known in other parts of Europe (and, indeed, in Russia its consumption is confined to the Asiatic territories), is Brick Tea; a term frequently made use of in the interesting travels of Ledebour in the Altaic Mountains, and which has lately been explained to us, and a specimen shown us, by the Reverend William Swan, an intelligent missionary, who has resided for ten years at Selinginsk, in Asiatic Russia, where Brick Tea is in very general use among the Mongolian tribes and Bouriats. It is produced at Fo-kien, and consists of old or coarse damaged leaves and stalks pressed into moulds and dried in the oven. Of this a small quantity is taken, pounded in a mortar, and infused for a long time in boiling water before the infusion is ready; which, however, is too bad for the

Chinese taste. The people above mentioned generally add to it a little salt and milk, and sometimes flour, fried in oil.

4358. *Linnæus* had the honour of introducing this interesting and valuable plant alive to Europe: but not till he had experienced many disappointments. The seeds would never bear the voyage; for, like all oily seeds, they turned rancid in a short time. His pupil *Osbeck* brought a living plant as far as the Cape of Good Hope, where it was washed overboard during a storm. *Lagerstrœm* conveyed two shrubs, for the true tea, to Upsal: but they turned out to be *Camellias*, which the Chinese call by the same name; not distinguishing it (any more than some able European botanists) generically from *Thea*. Some time after, one reached the harbour of *Göteborg* in good health: but, the evening before landing, the captain set the plant on the table of his cabin, where it was eaten by rats. At length, *Linnæus* advised Captain *Elaberg* to sow the fresh seeds in pots of earth at the moment of his departure from China; so that they might vegetate after passing the line; and the growing plants were thus brought in safety to *Göteborg* on the 3d October, 1763, and transported to the botanic garden of Upsal.

SUBJECT. 3. Zoology.

4359. The native Zoology of China is as little known as its internal geography; nor do we ever recollect to have seen or heard of preserved animals having been sent from this part of Asia. The vague accounts of the old travellers cannot be much relied upon. Excessive population has no doubt extirpated or driven away the native quadrupeds of any considerable size, nor can many birds be expected in a country where every acre of ground is sedulously cultivated. These remarks, of course, apply only to those provinces which form the heart of the empire while, of the rest we are in complete ignorance.

4360. Of the Ornithology, some notion may be formed from the numerous drawings of birds, now in Europe, executed by native artists, and from a few gleanings made from other sources. The Pheasants of the interior are magnificent birds, and no less than four species appear as natives of the northern provinces bordering towards Central Asia. Three of these, namely, the Ring, the Golden or Painted (fig. 653.), and the Pencilled Pheasants,

have been long domesticated; and, from their great beauty, are the chief ornaments of our aviaries; but the Superb Pheasant (*P. superbus*) is only known from drawings, and from its beautiful tail feathers, which occasionally are sent to Europe as curiosities.

GOLDEN PHEASANT.

4361. The Fish, delineated by the natives, exhibit a great variety; and from China we have derived the gold and silver fish of our ponds.

4362. The Insects are numerous and splendid. The common sorts are put into little deal boxes, well preserved, and sold to Europeans at the factories. The Chinese Lantern Fly emits a strong phosphoric light from its long trunk-like snout. The *Bombyx Atlas F.* is one of the largest moths in the world, measuring full eight inches from one tip of the wings to the other.

4363. The White Wax Insect (fig. 65, a) deserves a more particular notice, as producing an important necessary of life. The perfect insect (b) has been named by *Fabricius* *Cicada limbata*, but it is the larva which furnishes the substance itself. Sir George Staunton mentions them as insects not much exceeding the size of a fly, having very curious pectinated appendages, rising in a curve, and bending towards the head; the whole insect being covered with a white powder: this powdery substance is imparted

WHITE WAX INSECT.

to the stems of the plants, upon which these insects are found in thick clusters; it is then collected by the natives; hot vegetable oil is then applied, and the whole, when cold, coagulates, and becomes as firm as bees' wax. As a medicinal drug it is in high estimation throughout China, and, when made into candles, is reckoned superior, for that purpose, to bees' wax.

4364. The Silkworm, now cultivated in southern Europe, is said to have come originally from China, and there appears to be other species capable of producing silk cocoons of nearly equal value. The singularity of this people is

WHITE OX.

likewise apparent in their fondness for beautiful insects: little cages with living specimens of shining and splendid beetles (*Buprestides*), and of chirping Cicadas, being exposed in the markets, and hung in the drawing-rooms, for the amusement of the wealthy.

4365. *The Domestic Animals* are better known than the wild ones. The Chinese Oxen are of the humped kind, and appear to be of two breeds. One is equal to the smaller British race, with very short horns, bent back, and the colour of the hide frequently white (*fig. 655.*). The other, or dwarf Zebu, is so wonderfully small as not to exceed the size of a hog: it is commonly greyish white, with or without very little horns. The Pigs, also, are proverbially small.

SECT. III. *Historical Geography.*

4366. *No country has experienced fewer revolutions than China*, or has sustained so little change from those to which it has been actually subjected. The brief notices of the Roman historians, in the first centuries, represent the Chinese to have been precisely such a people as they now are, — quiet, peaceable, industrious; and to have had, even at this early period, silk, and perhaps tea, for their staple productions. The Chinese, indeed, possess a much more complete and connected series of annals than any other nation of Asia. Some of these, indeed, are manifestly fabulous, ascending to a period of 49,000 years. The Shoo-king, however, the first strictly official portion, begins only at the credible date of 3000 years before Christ. At that time, the country is represented to have been in a state of almost complete barbarism, and the invention, first of the necessary and then of the ornamental arts, is ascribed, in these regal documents, to successive early kings of China. It appears, however, that, about five centuries before the Christian era, China was divided among a number of petty princes, who acknowledged in the emperor little more than a feudal supremacy. About this time arose Confucius, whose master mind, improving, probably, on the ideas of his predecessors, established those principles of law, manners, and government which have since predominated in China. A series of struggles continued during many ages. These being at length suppressed, a complete despotism, tempered, indeed, by institutions and customs calculated to give it a mild and protecting character, was established. Thus situated, the nation lost its military energy, and became an easy prey to those barbarous neighbours who roam over the high table-lands of central Asia. But China has civilised her invaders; and the manners and institutions of the empire have survived the shocks of successive conquest. The most perilous was that made in the thirteenth century by Zingis Khan, a ferocious chief, who committed destructive ravages, and even formed the dreadful design of converting all China into a pasture-field; but this project was happily renounced. His successors made it their study to maintain, restore, and reform the abuses of the Chinese institutions. They were supplanted by a native Chinese dynasty, bearing the appellation of Ming; but in the commencement of the seventeenth century the Mandshur Tartars, from the northern side of the Great Wall, again overran the empire, which, however, they appear, from the first, to have governed mildly, and according to its ancient laws and institutions. This dynasty has greatly extended the foreign dominion of China. Retaining and enlarging their northern possessions, they have extended their empire so as to be in contact with that of Russia, for the space of sixty degrees of longitude. They have added to it all Western Tartary, to Cashgar, inclusive; and, within the last thirty years, Thibet, formerly a sacred and independent territory, has been compelled to own their sway.

SECT. IV. *Political Geography.*

4367. *There is not, and perhaps never was*, on the face of the earth, a government more purely and entirely *despotic* than the Chinese. No power, honour, or distinction exists, except that which centres in, and emanates from, the sovereign. In every other country, even of Asia, there are some hereditary offices; some descendants of ancient princes; above all, some classes elevated, as it were, to a higher scale of social existence than the rest; by all which means, strong and permanent lines of demarcation are drawn between the different portions of the community. In China, no distinctions are owned between man and man, except those conferred by office; and to these, the highest and the lowest are permitted equally to aspire. This supreme power of the monarch is claimed for him as the representative of Deity on earth, and the *sole* representative; for the Chinese, proud of the extent and populousness of their own empire, and very ignorant of all beyond it, are easily persuaded that the world does not contain a nation which is not subject or tributary to the "son of heaven." One God in heaven, and on earth only one *Ta-whang-te*, is the fundamental principle of their administration. When any mission or embassy arrives from a foreign court, the people are told that it is for the sole purpose of conveying tribute and homage to the celestial emperor. The individuals composing Lord Macartney's mission were not a little disconcerted by seeing a placard to this effect affixed to the barge in which they were conveyed up the Peiho; though, on reflection, they judged it inexpedient to notice the circumstance. The relation of a parent to his children is another image under which the supreme power of the Chinese monarch is represented. Corresponding with this, the parental authority is uniformly held forth as entirely paramount. A parent may sell his

children for slaves; and if he kill them, he incurs only a moderate penalty; but if a child addresses even abusive language to his father or grandfather, he is liable to be put to death.

4368. Although, however, *the despotism of China* be thus entirely raised above any direct and positive check, it is yet in practice *the most mild* and protecting of any that exists. The monarch is held within a circle of laws, institutions, and ideas, by transgressing which, he would lose the very basis on which his authority rests. The doctrine, that he is the son and vicegerent of Deity implies that he will use this high descent and power in securing prosperity to the nation over whom he thus holds a higher than earthly sway; and this is so fully recognised, that, even when his people are suffering under evils of nature, famine, earthquake, or inundation, he takes the blame, humbles himself, fasts, and strips himself of his costly attire, as a penitent under whose sins his people are groaning. The paternal character equally implies an anxious concern for the welfare of his people, who, amid the veneration with which they view these relations, are not forgetful of the accompanying obligations, or indisposed to revolt when they suffer severely from the non-observance of them. All prudent emperors, therefore, are at considerable pains to impress the idea that they govern consistently with their lofty pretensions. Above all, usage from time immemorial has established a certain regular system of administration peculiar to China, and which the most barbarous conquerors, after the first licence of victory was over, have found it wise to sanction and support.

4369. *In this system*, the fundamental, and, certainly, highly laudable maxim, has been, to make *knowledge the sole ground of official rank and public employment*. The examinations for this purpose are conducted with the greatest apparent impartiality, and, as seems to be generally believed, with much real fairness. Strict precautions are adopted for this purpose; such as, that every piece of composition that is to be judged, must be given in sealed and anonymous. There are three degrees, which the missionaries, in lieu of the uncouth Chinese appellations, designate by the European titles of bachelor, licentiate, and doctor. The first seems to be merely preparatory; the second qualifies the successful candidate to enter into the class of mandarins, in which is vested the whole administration of China. The mandarins are divided into nine degrees, rising from the lowest, who are collectors of the revenue, to the highest, who are viceroys and governors of provinces. As usual with the officers of an absolute government, each mandarin exercises within his sphere an authority as uncontrolled as that of the head of the state. His duty is not only to govern the people, but also to preach to them; and much importance is attached to the due exercise of this function. The tenour of the official prelections turns chiefly upon industry, peace, order, and respect to parents, the favourite Chinese virtues; and especial stress is laid upon their duties as faithful subjects and as payers of taxes. A portion of the mandarins are employed in carrying on those examinations according to which the several dignities are bestowed. Those for the lowest degree are conducted by a special class migrating for that purpose from place to place. The second degree must be the result of an examination in the capital city of the province, and under the eye of the governor. The highest rank of *tsintsé*, here translated doctor, must be the result of a triennial examination at Peking. It is considered necessary for all high and independent command, even for the governor of a city of the second or third rank. A few doctors, under the appellation of *han-lin*, obtain superior distinction and respect. According to an established regulation, each individual who attains any of the prescribed ranks in literature is promoted, according to seniority, and as vacancies occur, to the corresponding places in the government; and, though there appear to be many instances of favour, fraud, and even bribery, the general practice is conformable to this rule. Various and strict regulations are also made, to restrain each mandarin within the limits of his duty. No one receives office in his native province, or even in the adjoining one; and the same functionary is rarely continued in the same place more than three years. A triennial survey is performed, and reports are made by the higher officers on the conduct of their inferiors. All these precautions are not, it is supposed, sufficient to guard against much corruption and misgovernment; which, in so extensive a system, may be readily believed, not only from the unfortunate propensity of human nature to abuse power, but from the degraded character which despotism naturally produces in its agents. Yet, that a system which maintains by much the greatest mass of population any where united under one government in a state of uninterrupted industry, order, and well-being, should be radically bad and corrupt, seems a very rash and hasty conclusion.

4370. *The laws of China* have been compiled not with any large or statesman-like views, but with a minute and elaborate care to lay down the various descriptions of offence, and apportion to each a suitable punishment. The cane is the grand instrument of government; and all China has been compared to a school, kept in awe by the rod of a master. For its application, the law specifies two distinct dimensions of length and thickness, and more pointedly fixes the number of blows to be inflicted on the offender. For crimes of a deeper dye than those which the cane can chastise, banishment in different degrees is inflicted; and for those still more flagrant, death is awarded. Mercy, however, may be, and is exer-

cised by commuting punishments of every *grade* with different sums, according to a schedule, which the law carefully fixes. The Chinese have not improved so far in legislation as to abolish the barbarous practice of endeavouring to extract confession by torture, and that of visiting the crime of the guilty upon his innocent family. The objects of punishment are, generally speaking, reasonable, and resemble those of other civilised nations; but there is an attempt minutely to detail the various shades of guilt, and to fix a degree of punishment corresponding to each, which is vain, and even ridiculous. This detail is peculiarly copious in cases of bribery and corruption, the extensive prevalence of which is thus proved, and at the same time is probably very imperfectly guarded against. The Chinese laws have also the infirmity common to some early codes, of interfering in concerns beyond their province; such as forms, ceremonies, dress, and little transactions beneath the notice of a legislator. The manner in which an inferior bows to, or salutes his superior; the terms of the card written to him; the mode in which it is to be folded; the ceremonial of visiting, are all fixed by statute. Whether a Chinese sits down or rises up; whether he receives company at home or walks abroad, there is a rule fixed; and the cane is always at hand to punish its violation.

4371. *Upon the whole, the police is vigilant and effective*; and the laws are certainly not sanguinary; since in 1784, the entire number of persons condemned to death is stated by Amiot at 1384, a number deemed unusually large; yet, at a moderate estimate of the total population, it would not be more than one in 108,000.

4372. *The revenue of China is derived chiefly from the land tax, or rather rent*; for the sovereign, as in other Asiatic despotisms, is held to be the general proprietor. According to the usual Oriental scale, one tenth of the produce is levied. There is no lease, but ejection is not usual. The inferior kinds of grain are exempted. The produce is paid chiefly in kind, and is conveyed to Peking in the imperial barges (*fig. 656.*) through the

CHINA BARGES.

canals and rivers. The tax on salt is also very heavy, and its produce reckoned at about a fourth of the land tax; and another fourth is supposed to be constituted by the duties on imports and exports, the transit duties from province to province, and a variety of minor sources. Of the manufactured as well as the landed produce, a portion is paid in kind into the treasury. The only estimate of its amount hitherto formed in Europe is derived from a Chinese Encyclopædia, where it is rated at

12,000,000*l.* sterling, which in Britain might be reckoned equal in value to four times that sum. With such an impost, China would not appear at all heavily taxed according to its population; but there is a question, whether this includes the taxes levied in kind, and if it does not, the heaviest of the Chinese burdens would not be included.

4373. *The military force of China has been represented, in regard to numbers, at least, as very imposing*: it has every been made to amount to millions. Grosier and Van Braam, how-

CHINESE MILITARY.

ever, seem to agree in fixing the actual number at about 800,000. The greater part are a mere militia, in which the population, when called upon, are liable to serve. Their appearance (*fig. 657.*) and habits are most unmilitary, and they are scarcely called out unless for purposes of police; to pursue robbers, and pass muster on state occasions. Their paper helmets, wadded

gowns, quilted petticoats, and clumsy satin boots, exhibit nothing of the aspect of war. The Dutch ambassadors remark, that the emperor does not, like other Asiatic princes, surround himself with guards, or maintain, even in the capital, a body of troops for the support of the throne. Nothing more was observed at Pekin than small piquets at the gates and principal stations. The most really effective corps is that of the Tartars, consisting of light cavalry, who fight with the bow. Mr. Barrow, however, does not doubt that 20,000 disciplined European troops might march from Pekin to Canton, without meeting any serious resistance. It appears from ancient records that the Chinese and Tartars made use not only of gunpowder, but even of something resembling cannon; but artillery does not at present constitute any part of the effective force of the empire.

4374. *The Chinese government* have, as already observed, very numerous barges, for the conveyance of tribute, and other accommodations; also a few armed vessels to suppress smuggling and piracy; but nothing which can be called a navy. An English frigate would beat the whole of their maritime force.

SECT. V. *Productive Industry.*

4375. *No nation is so famed for industry*, in all the arts that minister to human subsistence. The lands, in particular, which are at all capable of culture, are tilled with a minute care, without example among any other people. The peculiar importance attached to agriculture is testified by an annual festival, in which the emperor exhibits himself to his subjects guiding the plough. It is not, however, supported by any large application of skill, science, or capital. The Chinese carry on farming on a small scale, with rude instruments, and almost no cattle. Their chief exertions are employed in irrigating their fields; and by the aid of the chain pump, they draw water out of their numerous rivers and canals, and inundate the crops of rice as soon as they are sown. This is done twice a year, and two crops are in general raised annually, without intermission or rotation. The highest mountains are formed into terraces, so constructed as to retain the requisite quantity of water, and allow what is superfluous to pass; and reservoirs are formed on the summits. The Chinese steep the seed-corn in liquid manure, and use the drill husbandry in order to avoid the waste of seed in broadcast; and the crop, when reaped, is placed on bamboo frames, and carried home on men's shoulders. Great care is also taken in transporting soils, and tempering them by mixture with those of an opposite character, as sand with a thick and adhesive clay, and marl with soils that are too light. But the Chinese are, above all, noted for their expedients in collecting manure, which, from the small number of cattle employed, is an object of great scarcity. Substances are appropriated to this purpose which are never thought of elsewhere. The urine of men and animals is most sedulously collected; to which is added human hair, all sorts of decayed herbs, with every offal and refuse which the strictest scrutiny can discover in the corners of streets and cities. As this manure, however, is little required on the inundated lands, it is in a great measure employed in raising culinary vegetables, particularly a species of brassica, called *petsai*, or white herb, which forms a favourite article of food with the Chinese.

4376. A grand and peculiar object of Chinese industry is the *tea plant*. It flourishes on the hills of southern China, chiefly between the tropic and the latitude of 30°. It is a bushy shrub, somewhat resembling the rose or myrtle tree, and which shoots leafy branches almost from the bottom of the trunk. The plants occur wild; but when cultivated, they are set in rows, four feet from each other, and, for the convenience of collecting the leaves, are artificially prevented from rising beyond a certain height. Whether the green and black teas be the produce of different species of plants, is a question discussed by Dr. Hooker, in the section on Chinese botany. The black teas grow chiefly in Fokien, and part of Canton; the green in the more southerly districts of Kiang-nan, Kiang-si, and Tche-kiang. They are raised in elevated and hilly districts, and generally in small compartments, like gardens. The earlier the leaves are plucked they are the more valuable and highly flavoured, though, of course, the produce is smaller. In black tea, a few leaf-buds plucked early in the spring constitute pekoe. The successive later pluckings form the congou, souchong, and, lastly, bohea. Green tea is similarly divided into gunpowder, imperial, hyson, and twankay. The leaves are rolled into the usual form by being passed through the fingers of a female, and then dried on thin earthen and iron plates over a charcoal fire. The merchants arrive at the end of harvest, give it a second drying, separate the different qualities, and, after packing it in large chests, convey it to Canton.

4377. Among other important agricultural products is the *sugar cane*, which appears to be taller and more juicy than that of the West Indies; but, as it is cultivated on the same small scale as all other articles, single proprietors cannot bear the expense of a mill on their grounds. The cane is boiled, and its juice expressed by migratory dealers, who bring machinery of a character very inferior to that used in our plantations, yet sufficient for its purpose. *Mulberry trees* are necessary for the production of silk, the staple manufacture of the empire. These trees, which do not appear to differ from those of Europe, are reared

with the greatest care, in rows ten or twelve feet asunder, and on beds of a moist loamy earth. They are frequently pruned or dwarfed, in order to make them produce young shoots with tender leaves, which are supposed to be much more nutritious than those upon older branches. The insects are nursed in small houses erected in the heart of the plantations, in order to be removed from all noise; for the Chinese have an idea that they will be injured even by the barking of a dog. After the silk is wound off, the aurelias become an article of food. That no ground may be lost, the intervals between the trees are planted with rice. Cotton is raised in the middle provinces in large quantities, yet still not sufficient to dispense with importation from Bombay. Tobacco is largely grown and consumed; and we may also mention camphor, ginseng, and a variety of leguminous plants.

4378. *As a manufacturing people*, the Chinese are also eminent. The fabric of porcelain, so superior in beauty to every other species of earthenware, originated entirely with them; and, though the taste of their imitators in Europe has produced more elegant patterns, they are still unrivalled as to its whiteness, hardness, and the transparency of the colours; the materials of which they possess a peculiar art in extracting from a vast variety of animal, vegetable, and mineral substances. Silk also is a fabric which the western world has learned from the Chinese; and the silks of China are still unequalled as to richness, though in Europe they are considered too heavy; and those of France and Italy are preferred. That light and elegant cotton stuff which we call *nankeen*, derives its name from the great Chinese city where it is manufactured, and the cotton which grows in the neighbouring province is said to have naturally the yellow colour peculiar to it; but Mr. Barrow informs us, that this colour is not worn by the Chinese themselves, and that blue, black, and brown, are preferred by them. The Chinese ornamented papers, so much admired in Europe, it is unnecessary to describe. Their lacquered ware would be highly distinguished, were it not here eclipsed by that of their Japanese neighbours. A number, however, of little ornamented trinkets and toys are made with the simplest instruments, and by the hands of single individuals; yet with a beauty which we in vain attempt to rival. Such are their ivory fans and baskets; their ornaments of tortoise shell and mother of pearl; their silver filigree and lackered cabinets, chests, &c. Their paper and printing are both good, and their ink, for some purposes, superior to the European.

4379. *Trade* must be considerable in a country so extensive, and abounding with so many valuable commodities; yet it has the peculiarity of being almost wholly *internal*. China supplies within itself nearly all the commodities which minister either to the use or the pleasure of her inhabitants. Her foreign trade is permitted only at two points, and under the narrowest restrictions; and though it be considerable to the nations with which it is carried on, by China herself it is scarcely felt as a national object. Another great commercial want in China is that of a monied interest. Capital is so scarce, and so little feeling of security exists, that money is lent only on pawn; and, in that case, government restricts the interest to three per cent. per month, above which rate, of course, it must have a tendency to rise. Such a deficiency, in a country so wealthy and a people so industrious, seems to imply in this boasted administration some radical defect, some want of protection for all fortunes that rise above the humblest mediocrity. There is no system of credit established between the merchants of distant provinces, no bills of exchange; no circulating medium except a copper coin of the value of the third of a farthing. In this respect China yields greatly to India, which, amid all its political agitations, has formed a great monied and banking interest, comprising some individuals of immense fortune.

4380. *The commerce of China* is thus chiefly confined to the operation of *bartering* the productions of its different provinces; and these are sufficiently various to afford room for a very extensive traffic. The most ample facilities are afforded by the great *rivers* and their numerous tributaries, and also by the *canals*, which are constructed on a greater scale than in any other country. One of the great objects is the conveyance to the capital of the imperial land-rent, which is paid in kind, and consists chiefly of rice. Van Braam was told, that the barges engaged in the conveyance of it amounted to 9999, which, with the Chinese, is an even number, and that there were 200,000 sailors employed, who worked much more at their ease than the rest of the nation. Salt is a most extensive article. The British embassy found, at Tiensing, piles of that commodity, which they calculated at 600,000,000 pounds. It had been brought from the southern coasts of Fokien and Tche-kiang, where it had been evaporated by the heat of the sun, for the consumption of Pechelée and the northern provinces. The conveyance of coal, turf, and other fuel, affords also occupation to numerous barges. The distribution throughout China of the silks, porcelain, and other fine manufactures of the central provinces, affords another source no less ample.

4381. *Of the foreign commerce of China* the European part is the most considerable, and is chiefly in the hands of the English, being conducted by their East India Company, to the exclusion of private traders. They maintain a factory, in which are employed twelve supercargoes and twelve writers, with some subordinate officers. The first two classes rise by seniority and the three senior supercargoes, called "the Select Committee," have the supreme direction both of trade and political transactions. The charges, in 1816-17,

amounted to 166,362*l.*, but were reduced, in 1828-9, to 138,526*l.* Their transactions are carried on entirely with the *hong* merchants, who are required to give security to government for the payment of the import and export duties on the cargo of every ship that arrives in any Chinese port, and for the good conduct of the crew. There are, however, others, called "outside merchants," many of whom, under sanction of the *hong*, carry on traffic to a great extent. Tea has been almost the exclusive article of import by the Company since 1824-5, previous to which, they used to introduce a considerable quantity of raw silk. In 1828-9, the import consisted of 28,617,280 lbs., of which 4,198,964 were bohea; 16,951,171 congou; 507,881 campoi; 183,493 souchong; 5,471,633 twankay; 154,767 hyson-skin; 1,149,371 hyson. There were, besides, 1,229,954 exported to the British North American colonies. The invoice value amounted, in 1828-9, to 1,981,419*l.* The exports by the Company consist chiefly of woollens, the amount of which has fallen from 832,160*l.* in 1813-14, to 459,553*l.* in 1828-9. The other articles consist of cottons, glass, iron, lead, which have fallen in the same period from 163,209*l.* to 124,098*l.* The question of throwing open this trade will soon become a subject of parliamentary discussion. The advocates of free intercourse urge, that, by economy of freight and management, tea could be delivered in London at one third less than it is sold by the Company; that other valuable articles would be imported; that extensive openings would be made for the introduction of British manufactures; and even a valuable contraband traffic carried on with other ports besides Canton. The Chinese, in fact, a people always intent on gain, seem only restrained by the jealous restrictions of their government from embarking with the utmost readiness in commercial transactions. The Dutch rank next to the English in the Chinese trade, but much inferior to them. Though the Portuguese possess the island of Macao, and the Spaniards from the Philippines have access to the port of Amoy, they make little use of these advantages. The French, Swedes, and Danes all carry on a little intercourse with Canton.

4382. *The trade to China from India*, where it is called the country trade, is almost entirely free, and has been carried to a great extent. It is chiefly with Bombay, which sends to it cotton, and the fine opium of Malwa; while from Calcutta it receives the inferior opium of Patna and Benares. The import of this article into China has increased surprisingly, from a value of 590,000*l.* in 1817-18, to 2,248,000*l.* in 1827-8. It has grown also in the face of the most rigorous prohibition, and by trade entirely contraband. This is carried on in the bay of Linting, with perfect security, by means of very slight precautions. Cotton, which used to be the largest article, fell during the above period from 1,310,000*l.* to 696,000*l.* Tin, pepper, betel-nut, and some other articles, raised the exports from India to China, in 1828-9, to 3,169,000*l.*

4383. *The American trade with China* has also, within the last thirty years, risen to very considerable importance. Commencing nearly with the century, it advanced till, in 1818-19, the imports and exports together exceeded 4,000,000*l.* sterling. Since that time it has rather been retrograde: indeed, in 1826-7, the amount had fallen to under 2,000,000*l.*; but in the following year increased fifty per cent. The Americans import from China tea to the extent of 10,000,000 or 12,000,000 pounds, nankeens, silks, and other minor articles; and give, in return, furs, chiefly from the north-west coast of America, Turkish opium, ginseng, woollens and cottons of English manufacture, and a balance in bullion.

4384. *The foreign trade of China* in her own bottoms, though bearing no proportion to the wealth and greatness of the empire, is not altogether inconsiderable. It is carried on in large unwieldy junks, whose structure can never be improved, as the slightest deviation from their present clumsy structure would subject the owners to the high duties imposed on foreign merchants. The viceroy of the provinces fixes the number of junks that shall sail to each particular country, and the species of cargo which they shall carry. Mr. Crawford reckons that there sail annually to Japan ten junks, making two voyages; thirteen to the Philippines; four to the Sooloo isles; thirteen, Borneo; two, Celebes; seven, Java; ten, Sumatra; nine, Singapore; six, Malacca; eighty-nine, Siam; twenty, Cochin-China; nine, Cambodia; twenty, Tonquin: in all, 212; which, with a number of smaller ones, make the tonnage of the celestial empire about 8000. These vessels are partly built and owned in foreign countries, but by Chinese natives. They have numerous owners, each of which has a compartment divided by strong planks from the rest of the vessel. In return for the staples of China, they receive gold, tin, and the gelatinous substances called sea-slug, and a peculiar species of birds' nests, which, when made into soup, are reckoned peculiarly delicate and nutritious.

4385. *The fishery* that exists in China is inconsiderable in a national or commercial point of view; but, as the means of individual subsistence, no nation carries it to such an extent. All the lakes, broad rivers, and sheltered bays of China are covered with floating cities, the crowded population of which have no home but on the water. Staunton and Barrow suppose that the waters of China are as densely peopled as the land, and that they sustain a floating population equal to that of the whole British empire. Chinese invention has discovered modes of ensnaring the finny tribes quite peculiar to itself. One most singular

resource consists in the employment of the fishing bird, a species of cormorant, which dives into the water, seizes the fishes with a long bill, and brings them to its master, accepting in recompense such portion as he chooses to bestow. Others fasten to the side of the vessel a board painted white, which, by moonlight, has the appearance of glittering waves, and attracts the unwary tenant of the stream. Many, also, of the owners of these watery mansions keep large flocks of ducks, which go out and return, obedient to a signal. In some of the still waters are to be seen floating islands, composed of broad rafts on which houses are built, and some parts are even laid over with earth, and crops raised upon them.

4386. *In public works*, undertaken for purposes of utility, China stands without a rival. Ancient Egypt, indeed, exhibits monuments of equal labour; but these were mere displays of vain and superstitious pomp, and cannot come in competition with those canals which form the foundation of the prosperity of China. The labour and ingenuity are the greater, as they are seconded by little science; for the Chinese are unacquainted with the construction of locks, or other means by which a stationary supply of water can be ensured. Their canals are merely artificial rivers, formed by changing the direction of those constructed by nature. By that called, emphatically, the Great Canal, an uninterrupted communication of 500 miles is maintained between the Peiho, or river of Pekin, and the great central stream of the Yangtse-kiang. A considerable river is arrested as it flows over the high land of Shantang, and the divided stream, turned into opposite directions, forms the basis of this great watercourse. In connection with the rivers, this canal completes, with only one short interruption, a line of 1000 miles of navigation from Pekin to Canton. On the other hand, the roads are narrow, and unsuited to vehicles of any magnitude; there being little ground to spare, and cattle being equally scarce. The only mode of travelling in state is in palanquins, which, as well as the baggage, are conveyed on the backs of coolies or porters, 1000 of whom, at a period when the Great Canal was frozen, were employed in carrying to Pekin the presents of the Dutch ambassadors. Ordinary goods are conveyed by double barrows, forming a small cart, the movements of which are produced, when wind favours, by the use of sails similar to those of a boat. The narratives of the late embassy occasionally mention the passage of whole *fleets* of wheelbarrows. This practice is noticed by the old travellers, and, on their testimony, by Milton, in his allusion to

“ Sericana, where Chineses drive
With sails and wind their cany waggons light.”

4387. Among the mighty works of China, may here be mentioned *the Great Wall*, though it was constructed entirely with a military object. Perhaps it is unrivalled among the productions of human labour. The wonder is not merely in the continuity of the rampart for upwards of 1000 miles, but in the difficulties which have been surmounted in carrying it over so rugged and mountainous a country. One elevation, near the place where the British embassy passed, was calculated at upwards of 5000 feet. It was seen, however, extending along the ridges of hills, over the tops of the highest mountains, crossing the deepest valleys, continued upon arches over rivers, and doubled or trebled in many parts, to take in important passes (*fig. 658.*). Its usual height is thirty feet, though a smaller and even half

658

PART OF THE GREAT WALL OF CHINA.

that elevation suffices where it is carried along declivities. The top is paved, and so broad that a carriage can drive along it. Square towers, sometimes forty feet high, are erected at very short distances. Mr. Barrow observes, however, that this huge work implies no display of skill, either in architecture or military defence. It is merely a mound of earth heaped together, and faced with brick or stone, similar to the walls with

which all the cities of the Chinese are surrounded. Their history describes it as completed in the third century, but without mentioning the period of time employed in its construction. As a defence against invasion, on a great scale, such barriers have always been found nugatory; but this was probably useful in repelling the predatory inroads of those little wandering tribes who filled a great part of the surrounding deserts. Since the Tartar conquest, which incorporated them all into the Chinese empire, its use is no longer felt, and by the Chinese themselves it is now little regarded.

SECT. VI. *Civil and Social State.*

4388. One of the most remarkable features of China is its population, which is certainly much the greatest that is in any part of the world united under one social and political system. It is, however, a subject which has afforded no inconsiderable scope for doubt and controversy. Lord Macartney's famous number of 333,000,000, though stated to him on official authority, which he considered respectable, is now discredited. On the other hand, some old enumerations, which make the amount only 50,000,000 or 60,000,000, are confessedly imperfect. One of the best authorities is that of the *Yetungshe*, a sort of encyclopædia, which rates the number of families paying taxes at 28,514,488; which, at five to a family, would give an entire population of 142,000,000. An addition being made, including the privileged classes, those living on the water, and others variously exempted, may raise the total to upwards of 150,000,000. This agrees pretty closely with an enumeration communicated by Dr. Morrison, as made by the present emperor, which amounted to from 145,000,000 to 146,000,000 *mouths*. On the other hand, statements reported by Father Allerstein in 1743, and by Grosier in 1760 and 1761, agree in making the number 196,000,000 or 198,000,000. All these are probably very vague; especially as, when they come to the detail of the provinces, they exhibit the most complete discrepancies from each other. On the whole, we cannot persuade ourselves that the population of China is materially under 200,000,000. China is eight times the extent of France: it is more fruitful, more carefully, though perhaps not quite so skilfully cultivated. An equal density would give 230,000,000 or 240,000,000; and really it does not seem likely to be much inferior. Loose as this mode of estimate is, it is probably better than enumerations which are proved to be vague by their contradictory character.

4389. *The whole of this immense multitude* composes, in the strictest sense, one people, cast in one mould, both of form and mind. Their external aspect (*fig. 659.*) marks them

659

GROUP OF CHINESE.

generally as belonging to the Mongol race, and seems to indicate them as having originally come across the high pastoral table-land of middle Asia. It has been softened down, however, by pacific and regular habits, as well as by some features strictly Chinese. "The broad, irregular, and half-closed eye; the linear and highly-arched eyebrow; the broad root of the nose; the extension of the upper eyelid a little beyond the lower; the thin straggling beard, and the body generally free from hair; a high conical head and triangular face," are given as their peculiar characteristics. Their complexion is of a sickly white, or pale yellow, like that of a faded leaf, or the root of rhubarb. Their hair is universally black, and, if it fail at all in that colour, the defect is supplied by painting: it is so thick and strong, that they compare that of Europeans to the pile of the finer furs. They are generally of the middle size; few tall men, and still fewer dwarfs or deformed persons, are found among them. The female sex were seen with difficulty, and almost only those of the lowest ranks, who were not distinguished from the men by any delicacy of feature or complexion: on the contrary, their persons were pronounced by Mr. Hickey the reverse of what is generally considered as elegant or beautiful. Mr. Barrow also observed, that the air of good humour, which appears in the visage of the male Chinese, is exchanged in that of the females for one of fretfulness and discontent; which, perhaps, is but too well justified by the tyrannical treatment which they experience. The few, however, of the higher ranks who presented themselves to the view of the English embassy made a much more favourable impression; and, from the delicacy of their complexions, and the regularity of their features, appeared entitled to admiration (*fig. 660.*). The same judgment is warmly pronounced by the Dutch ambassadors, who appear to have made very diligent observations upon this subject. One somewhat dishonest cause of the difference here perceptible is found in the trade which

prevails in China, of purchasing, at an early age, girls who afford any promise of beauty, and training them for the future wives and concubines of the opulent classes.

4390. *The national character* of the Chinese has been very differently regarded, and per-

MANDARIN AND LADIES.

haps there has of late prevailed a disposition to rate it somewhat too low. Quietude, industry, order, and regularity, — qualities which a despotic government seeks always to foster, — seem to be peculiarly conspicuous. A general good-humour and courtesy reigns in their aspect and proceedings: even when they jostle and come into collision with each other, the extrication is effected without any of that noise, and exchange of turbulent and abusive language, which are but too often witnessed on such occasions in European cities. Flagrant

crimes, and open violations of the laws, are by no means common. The attachments of kindred are encouraged and cherished with peculiar force, particularly towards parents and ancestry in general. The support of the aged and infirm is inculcated as a sacred duty, which appears to be very strictly fulfilled. It is surely a phenomenon in national economy very worthy of notice, that, in a nation so immensely multiplied, and so straitened for food, there should not be such a thing as either begging or pauperism. The wants of the most destitute are relieved within the circle of their family and kindred. It is said to be customary, that a whole family, for several generations, with all its members, married and unmarried, live under one roof, and with only two apartments, one for sleeping, and the other for eating; a system, the possibility of maintaining which, implies a great degree of tranquillity and harmony of temper. Within the domestic circle, however, and that of ceremonious social intercourse, seems to terminate all that is amiable in the Chinese disposition. In every other respect they show no interest in the welfare of their fellow creatures, nor even the common feelings of sympathy. Repeated instances have occurred of Chinese dropping into the sea, and being rescued by the English, while their own countrymen did not take the least notice, or make a single effort to save them. Their propensity to fraud has been amply noticed by travellers, but appears to have been somewhat exaggerated. To the hong merchants belongs the merit of having established a character of very strict honesty; and many even of what are called "outside merchants" appear to be highly respectable. The custom of the Chinese to write upon their signs, "Here no one is cheated," — though we might be rather rash in concluding, with De Pauw, that it implies a predetermination to cheat all the world, manifests pretty clearly that the thing is considered neither unprecedented nor improbable. The want of all independent place and power, the abject submission required, and the application of the rod to *all* classes alike, produces a general degradation of character, and the vices which are its natural consequences. The highest officers of state showed an entire disregard of truth, and hesitated not to utter the most glaring falsehoods, whenever a political purpose was to be served. Again, the practice of exposing children is another repulsive characteristic of the Chinese, which harmonises very ill with their apparent mildness, and boasted respect for the ties of kindred; nor can the poverty which prompts it form its excuse. In Peking, where it most prevails, the number of children annually exposed, has been stated at 9000; but this is now admitted to be a great exaggeration, and the real number cannot be well guessed. The practice derives no palliation from being exercised chiefly upon the female sex, in consequence of the low estimation in which they are generally held in China. According to the Dutch ambassadors, females in that country may be considered universally as objects of traffic. Those who promise to be handsome are purchased in early youth by the class of dealers above mentioned, and trained for the harems of the great, where they pass the rest of their days, according to Eastern custom, in splendid

CHINESE LADY'S FEET.

seclusion. The confinement, if less rigorous than in some other of the Asiatic states, is yet strictly ensured by an infirmity arising out of the fantastic taste which prescribes, as indispensable to female beauty, that the feet be reduced to the most minute possible dimensions (*fig. 661.*). This, by compression from an early age, is effected to such an extent, as to leave them barely able to totter from place to place, holding by the wall or other supports. The lower ranks, on the other hand, after being purchased by the husband, are treated almost as slaves, and

subjected to the hardest labour: they have even been observed by travellers yoked to the plough.

4391. *In regard to religion*, China has the singular peculiarity of having none connected with or supported by the government. No creed is made a matter of state, except the abstract belief in the existence of a Supreme Being, and of the emperor as his sole vicergerent on earth. As to every further creed and rite, the nation adopts any or none, as it may judge most expedient. The learned, indeed, generally affect indifference upon this subject, and limit themselves to the above simple belief, joined to a superstitious reverence for ancestry and for the ancient sages of the empire. The people, however, require some more sensible objects of worship; and the vacant place has been chiefly occupied by the sect of Fo, essentially the same with that of Boodh, which rules in Thibet, and has spread thence through all the neighbouring regions of Tartary. It appears there with its doctrine of transmigration, its numerous images, its monastic institutions, its bells and beads, its noisy music, and its peculiar dress; all giving it such a resemblance to the catholic worship, that the missionaries of the church of Rome fill their journals with perpetual lamentations on the impossibility of distinguishing the two. Although jealous, in general, of every foreign system, the Tartar dynasties have been inclined to protect this religion of Tartar origin. The same favour has not been extended to Christianity, which has repeatedly made some progress. The Jesuit missionaries, in particular, have always rendered themselves necessary at court by their knowledge, contrasted with the Chinese ignorance of the astronomy requisite to predict eclipses, and to form a correct calendar. As soon, however, as conversions began to be effected, complaints were always preferred, that the new sect were changing the customs, and even the fundamental principles, of the empire. The prohibition of the almost divine honours paid to ancestry; the congregational meetings attended by females, and the representing celibacy as a meritorious state, were the points of objection most forcibly dwelt upon. Repeated persecutions have, in consequence, taken place, by which this faith has been almost entirely extirpated. Such also has been the fate of Islamism, though there are still mosques in some of the principal cities. The superstitions usual among the vulgar in all countries prevail also in China; as witches (*quey-shir*), good and evil supposed to be locally attached to particular spots, lucky and unlucky times. In the ports on the ocean, pagodas were found chiefly erected to a mysterious being, called the "King of the Eastern Sea;" a worship obviously suggested by the grand object which nature there presented to them.

4392. *Learning*, in China, must form a leading pursuit, and might be expected to be found in a very flourishing state, since it is held in almost exclusive honour, and forms the sole road to rank, distinction, and power. Yet this very circumstance is perhaps the cause of the limited and stationary state in which it actually exists. When science becomes a state engine, any change in its nature or extent becomes a political innovation, which the jealous character of despotism will never tolerate. The language, arrested probably by this cause at an early stage, requires alone the laborious application of years; after which the laws and history of the empire, and the precepts of its ancient sages, seem nearly to fill up the routine of official study. Mathematics and astronomy, which have been often cultivated with the highest success under absolute governments, have not in China reached beyond their most elementary forms. The Court Calendar, published for the guidance of the nation in various important concerns, has for a long time been constructed by foreigners; Arabs, Hindoos, and even Europeans. Notwithstanding, also, the paramount importance attached to objects of utility, the Chinese have made no progress in the application of the mechanical powers: they cannot even construct a common pump; and all their great works are the mere result of indefatigable labour performed by a multitude of human hands.

4393. *The Chinese language*, arrested between hieroglyphical and alphabetic writing, presents a singular phenomenon. The simple picture of the object, which appears in some of the early writings, has been changed, for facility of writing, into the letter; but the next step, which should have been to make each letter express a simple sound, and thus a small number by repetition represent all the words in the language, has never been taken. Every word, or rather every idea, continues to be represented by a separate character; and such characters, in the most copious Chinese dictionaries, amount to no less than 40,000; a much greater number than there are of words in any of our languages, where many expressions represent several ideas, the context explaining the one meant in each particular case. In China, each character represents the one single and separate idea. This copiousness becomes the more remarkable when contrasted with the peculiar poverty of the spoken language. This last consists altogether of monosyllables; and as they want, moreover, the letters *b*, *d*, *r*, and *x*, they have not been able to form more than about 330 syllabic sounds. These by accents and peculiar intonations, are multiplied to about 1300; still there remain about thirty written words to every spoken word. The latter afford thus an exposition of the written words, and, without reference to their sound, form the proper Chinese language. Europeans long looked with despair upon this chaos of characters, to learn the whole of which seemed the work of a life. It now proves, however, that a clue exists by which they

may wind their way. Experience discovered first 473, and then 214 particular forms, one or other of which appears in every Chinese character. These, by the natives are called the eyes, by Europeans the keys or elements, of the language. Dictionaries have been constructed, by means of which the whole language has been arranged under them as with us under letters; and such facilities are thus afforded, that Europeans, in the course of two or three years' study, have been able to translate works from the Chinese.

4394. *The literature* of China appears to be extensive, though little known to Europeans. The perusal of written books, being the high road to honour and distinction, becomes a fashionable and favourite occupation with all classes. No nation of Asia can boast of such a mass of historical annals; but, though these are compiled with care, they evince not that philosophical spirit and fearless research which give lustre to the great historians of the West. The works on laws and on statistics are also very extensive. Like those on history, they are composed by the *han-lin*, or doctors of the first class, and are sent as presents to the great mandarins. For the amusement of the people, there appear in quick succession sundry dramas, poems, and tales, a few select specimens of which have lately been translated. The state of subjection in which the people live, and the narrow circle of their ideas, are unfavourable to any lofty flights of original thought; but their writings are often judicious, pleasing, and natural. Many of their poems are didactic, composed of short maxims or sentences; and the incidents in their stories are chiefly of a domestic nature. Printing was practised in China long before it was known in Europe; not, however, by employing movable types, which would be ill fitted to represent their innumerable characters; but by cutting these characters out of wooden boards, of which, consequently, there must be one for each page. The missionaries, however, by taking the keys instead of letters, have succeeded in printing according to the European style.

4395. *Theatrical exhibition*, in its various shapes, appears to be a favourite Chinese amusement. Mr. Barrow heard, that there was in Peking about 100 companies, each consisting of 50 persons and upwards, conveyed from place to place in passage-boats. They perform not, as in Europe, to crowded and public audiences, but are sent for by the rich to act at their own houses. The foreign ambassadors have not, upon the whole, been very much edified with those presented for their entertainment. The Dutch declare that the spectacles exhibited for the entertainment of the court of China would not have attracted an audience in Europe at a country fair; and Staunton remarks on the grotesque nature of the exhibitions, and the presentation of scenes which taste and delicacy would have elsewhere withdrawn from the public eye. It is to be observed, however, that the selection of objects of mere show and buffoonery was the only way in which those could be amused who knew nothing of the language. Recent research has made us acquainted with dramas having a regular plot, and by no means destitute of interest and character.

4396. *The fine arts*, in China, are deficient. Her painters, indeed, can express with minute accuracy the forms and colours of natural objects; and can produce, on the whole, a light and pleasing effect. Being wholly ignorant, however, of perspective, and of the distribution of light and shade, they can accomplish no effects of foreshortening or distance; neither can they imitate that depth and blending of tints which nature actually presents to the eye. They give groups of individual objects; but not a picture. Their music, notwithstanding the mighty effects which they ascribe to it, is, in fact, still more defective. It is perfectly simple, and has been compared to the Scotch, but without possessing its plaintive tenderness.

4397. *In the architecture* of the Chinese, there is little either of elegance or of that magnificence which we denominate Oriental. The most solid material is half-burnt brick; and the mansions of the highest as well as the lowest are formed on the model of the primitive Tartar dwellings; but, even in the great cities, a traveller might fancy himself, from the low houses with carved overhanging roofs, uninterrupted by a single chimney, and from the pillars, poles, flags, and streamers, to be in the midst of a large encampment.

The fronts of the shops are covered with varnish and gilding, and painted in brilliant colours. The external splendour of the palaces and pagodas consists merely in coloured varnish and gilding. The rooms, even those occupied by the emperor, are small, and little ornamented. The Dutch embassy was received by him in an apartment only ten feet square. There are, however, a number of large halls (*fig. 662.*), like galleries, for festivals and public occasions.

HALL OF AUDIENCE IN CHINA.

4398. *The gardens of China have been celebrated, and are constructed on an opposite principle to ours. With the view of escaping from the monotony of a country entirely sub-*

IMPERIAL GARDENS.

jected to art and culture, the Chinese seek to exhibit the wildest and rudest aspects of nature; lakes, dells, hanging woods, and natural forests. In the great imperial gardens (*fig. 663.*) of Yuenmien and Zhehol, where an extent of country is ornamented in this manner, a great deal of really fine scenery is included. In private gardens, on the contrary, where objects of which the value depends on their grandeur are attempted to be comprised within a space of one or two acres, a ludicrous effect is often produced.

4399. *The Chinese are more completely and substantially clothed than the other nations in the south of Asia. The men wear long gowns and petticoats, which would give them a feminine appearance, did they not add boots; while the women, with short jackets and trousers, might pass for men, but for the elegant ornament of braiding their hair with flowers. Silks, satins, and occasionally fine cottons, form the material of dress for the higher ranks: the lower are clad in coarse cottons. The button forms the attribute of rank, and by its various shapes and sizes expresses at once, to a Chinese eye, the dignity of the wearer.*

4400. *The Chinese differ from the other Orientals in their food, and in the mode of taking it. Instead of squatting on the floor, and eating with their fingers, they sit on chairs, eat off tables, and raise the food to their mouth with a species of chopsticks. Their dishes are placed on small tables, but piled in successive stages over each other. They consist, in a great measure, of confections and fruits, the latter of which are iced. One favourite luxury of the rich consists of soups made with the gelatinous substances, sea slug, birds' nests, &c., imported from the East India islands. The mandarins live luxuriously, and have several meals a day, with numerous dishes at each. The ordinary Chinese can have only rice, with a little seasoning; but they eat heartily of it, and scarcely any thing, Mr. Barrow says, puts a Chinese out of humour, except being interrupted at his victuals. Tea is the well known universal beverage, presented at and after meals, and on all occasions. It is drunk without cream or sugar, hot water being poured over the leaves. Their wine is bad, but they have an ardent spirit distilled from grain, of which they sip pretty largely in private. Even convivial excesses occasionally take place.*

SECT. VII. *Local Geography.*

4401. Having thus completed the general survey of China, *its details* will not detain us long; since, though vast, they present a monotonous uniformity, and do not, at any point but one, come in contact with European connections and interests.

4402. We shall begin with *the province of Pechellee*, the most northerly, and, though not the finest, yet distinguished as containing the capital of the empire. Its elevation, as well as its position, combine to render the climate comparatively cold; ice prevails for three or four months in the year; the sea-coast is marshy; and, instead of rice, wheat and barley, the species of grain that belong to the temperate climates are chiefly raised. The Tartar frontier presents mountains of considerable height, over which extends the Great Wall.

4403. *Pekin* (*fig. 664.*), the celebrated capital of this great empire, stands almost in a

PEKIN.

corner of it, only forty miles from the Great Wall. It consists of two very distinct parts, the Chinese and the Tartar cities, of which the former is the most elegant and populous, but the latter is adorned by the imperial palace and gardens. The united city is about twelve miles in circumference, surrounded by walls, like every other in China; but those of Peking are peculiarly lofty, and completely hide the city from those who are without. The population has been a subject of controversy. The English embassy calculated it

at 3,000,000; probably too high; but Malte-Brun, in calling this "an extravagance more than English," commits, we apprehend, a much greater one, when he says, that this number could not have room to stand upright in Peking. The Russian embassy judged it only double the size of Moscow, and as containing nearly as much unoccupied ground; which would infer only 600,000 or 700,000. But Moscow is built in a very scattered manner, and a much greater number of Chinese are understood to live under the same roof than is usual among the inhabitants of any city in Europe. The estimate of Le Comte, who appears to have studied this subject with particular attention, is 2,000,000; which, perhaps, with a little abatement, may be nearest the truth. Peking is divided into regular streets, the principal one of which crosses the whole city, and is about 120 feet wide, unpaved, but carefully watered. It consists chiefly of shops, which, though, like every other edifice in the empire, seldom exceeding one story in height, are adorned with flags, varnish, painting, and lanterns of a peculiar and elegant construction. The streets are immensely crowded, as the Chinese spend much time in the open air.

4404. *Other towns* in Pechelee are Tongchoo and Tiensing, the ports of Peking; one on the Peiho, and the other lower down, at its confluence with the Queyho. This last was stated by the mandarins to contain 700,000 souls; an estimate which seemed to agree with the crowds it put forth; and its length is nearly equal to that of London. Paoting, the residence of the viceroy, has an agreeable inland situation in the heart of a fertile district.

4405. *Shantung*, to the north of Pechelee, is traversed in the west by the Great Canal on its way to the Yellow River, and in the east stretches into a great peninsula. This province is mountainous; many parts of it are bleak, and thinly inhabited; and, instead of rice and wheat, yield only the inferior articles of d'hourra and millet. Valuable mines of coal are found here, which serve for the supply of the whole empire. Tsinan, the capital, is an ancient city, with the tombs of many kings in its neighbourhood; it has, at present, flourishing manufactures of silk.

4406. *Proceeding southwards*, still along the Great Canal, we enter *Kiangnan*, the pride and the boast of China. Here are all the grand communications of the empire meet: the Hoang-ho and the Yang-tse-kiang flow into the sea, and are connected by the Great Canal. Mr. Barrow describes with admiration the scene which appeared at their junction:—"the multitude of ships of war, of commerce, of convenience, and of pleasure; some gliding down the stream towards the sea, others working against it by sails, oars, and wheels, and others lying at anchor; the banks on either side, as well as those of the canals, covered with towns as far as the eye can reach; the continuance, along the canals, of cities, towns, and villages, almost without interruption."

4407. *Nanking*, the ancient capital of China, is, in extent, considerably superior to Peking. The exterior wall, enclosing the suburbs, resembles rather the boundary of a province than of a city. Since the government and tribunals, however, were transferred to Peking, it has greatly declined, and about a third part of its area is now uninhabited. It still continues to be the most manufacturing city of China. Its silks, its paper, the cottons bearing its name, are preferred over the empire to those made elsewhere. Learning also continues to flourish in an unrivalled degree; the booksellers' shops are nowhere so amply furnished; and a greater number of doctors are sent forth from it than from any other city. Nanking contains, also, in its pagoda, or porcelain tower (*fig. 665.*), the chief architectural monument of the empire. It consists of nine stories, ascended by 884 steps. The material is a fine white tile, which, being painted in various colours, has the appearance of porcelain; and the whole is so artfully joined together as to seem one entire piece. The galleries are filled with images, and set round with bells, which jingle when agitated by the wind. On the top is a large ball, in the shape of a pine-apple, of which the Chinese boast as consisting of solid gold; but on that point foreign observers seem to be sceptical.

665

PORCELAIN TOWER AT NANKING.

4408. *In this province, also, the traveller who proceeds southward along the Great Canal* finds the large and beautiful city of *Soutcheoufoo*, which the Chinese extol as their terrestrial paradise. Branches from the Great Canal traverse it throughout, and render it, like Venice, a city on the waters. The small lake of Taihoo, in the neighbourhood, surrounded by picturesque hills, affords a scene of delightful recreation. Here all the classes whose function is to minister to pleasure, lawful or unlawful, are trained to their respective vocations; comedians, dancers, jugglers, and the females destined to fill the harems of the great. The latter are judged to be fairer and more gracefully attired than those of the northern cities; and paint, both red and white, is lavished to heighten their beauties.

4409. *To the north*, Kiangnan has on its left the maritime province of *Tchekiang*, one of the finest in China, and covered in particular with extensive plantations of mulberries. The surface is very picturesque, its rich plains being varied by irregular hills and rugged rocks. It is distinguished by containing the great city of *Hangchoo-foo*, situated at the point where the Great Canal joins the river Chiang, which here, in approaching the sea, spreads into an ample lake. This is the city described by Marco Polo under the name of Quinsai, as

the capital of southern China, and as the most splendid and delightful he ever saw. Even in its present decline, its magnitude, rivalling that of Pekin; the varied beauties of its lake, the numerous pleasure parties which cover its surface, the gilded barges, with floating streamers, sailing to and fro, and the aerial pavilions with which its margin is studded, form a magic scene, which acquits of all romance the glowing descriptions of that celebrated traveller.

4410. *Kiangsee*, to the east of *Tchekiang*, is a province bordered and traversed by mountains of considerable height; but as these mountains, wherever it is possible, are cultivated to the summit, and have many fine intervening valleys, it is almost as fertile and populous as any of the other provinces. It is traversed by the *Poyang lake*, a noble piece of water, surrounded by mountains of considerable height, whose sides are highly cultivated and peopled. *Nanchang*, the capital, on a river which falls into it from the north, presents monuments characterising a city of the first rank, but is now reduced to a state of poverty. *Yaotcheoufoo*, and several other cities, rise on the borders of the lake. The place most worthy of notice in *Kiangsee* is *Kinteching*, which the Chinese, indeed, account only a village, but a village which, according to some, contains 1,000,000 inhabitants. It is the centre of the manufacture of porcelain, and its site is marked by the clouds of flame and smoke which rise from it, and make it appear at night like a great city on fire. No foreigner has ever been admitted into its precincts, lest he should discover the secret of the processes there carried on. A river which falls into the *Poyang lake* affords the means of exporting the produce of *Kinteching*, and exchanging it for that of the rest of the empire.

4411. *Interposed between Kiangsee and the ocean* is the maritime province of *Fokien*, or *Footchien*, a region of considerable resort to early European navigators, while the southern ports of China continued open to them. It is now little noticed; but is described as a very fine province, covered with hills, usually such as Chinese industry can cultivate to the very summit. It abounds not only in grain, but in fruit, particularly oranges; and the tea plant is reared on a great scale. *Foutcheou*, the capital, situated near the mouth of a great river which admits the largest vessels, and is crossed by a superb bridge of 100 arches, makes an ample display of whatever is splendid or beautiful in a Chinese capital. *Amoy*, on an island upon the coast, affords a very fine harbour, whence the Chinese carry on a great part of their foreign trade.

4412. *The southern frontier of Kiangsee* is bounded by a lofty and naked barrier of mountains, which interrupts the water communication, hitherto continued from Pekin. On the other side is the province of *Quangtung*, the northern approach of which consists, in a great measure, of naked and rugged mountains, diversified by fantastic rocks, and on many parts of which even Chinese industry can impress only a very limited cultivation. The interior, however, beyond the city of *Chaucheou-foo*, equals any of the other maritime provinces. It is traversed by the river *Pekiang*, to which goods, from the great water communication, are conveyed by a land carriage of some days, and which, during a course of 250 miles, is covered with barks transporting merchandise to and from *Canton*.

4413. *Canton* (*fig. 666.*), the best known city of China, and with which alone Europeans

carry on habitual intercourse, is situated at the confluence of the *Pekiang* with the *Taho*, a much larger river coming from the west. Their united streams spread below this city into a broad estuary, called, by Europeans, the *Bocca Tigris*, which extends about fifty miles in length, and twenty in breadth, to its junction with the ocean. *Canton* itself is about five miles in circumference; besides which, its extensive suburbs compose, as it were, another city. The great estuary of the *Bocca Tigris* also is covered with

floating mansions arranged in streets, the tenants of which have no home on land. The *hongs*, or factories, are handsome buildings, situated in the suburbs, and arranged in a line along the water. The streets are narrow, and the front of almost every house is a shop; but the suburbs and vicinity contain many agreeable sites, in which the wealthy inhabitants have erected their mansions. All that has been said of the European trade of China applies to that of *Canton*, now the sole theatre of this trade; for the admission granted at an early period into *Amoy* and *Liampo* has long been withdrawn.

4414. Near the mouth of the *Bocca Tigris* is the *Island of Macao*, separated from the continent only by a narrow river channel. It was once a place of high importance, whence the Portuguese, in the days of their pride, carried on most of the commerce between Europe and China. It has more than shared, however, in that supine sloth and decay which has involved all their Eastern empire. The town contains, at present, a population of about 12,000, including about 4000 Portuguese, who still fit out a few vessels, or give their name to those whom it benefits in trading with this jealous government. Thirteen churches, four convents, and fifty secular ecclesiastics, are supported by this priest-ridden population.

4415. West of *Quangtung* is *Quangsee*, which does not rank high as to wealth and population, a great part of its territory being covered with thick forests and rugged mountains. In the south, however, are plains that yield abundance of rice, of which a supply is even sent to *Canton*. The river *Taho*, which traverses it throughout, has its navigation obstructed by rocks and cataracts. Considerable mines are said to exist in this province, which the jealousy of the government prevents from being worked. Neither *Queyling-fou*, the capital, nor any of the other cities of *Quangsee*, rank with those of the rest of China.

4416. West of *Quangsee* is the frontier province of *Yunan*, situated on a still more lofty portion of that great chain which traverses the southern portion of the empire. Though the site be elevated, and the climate consequently temperate, it is well peopled, and yields many valuable products. The upland tracts are occupied by a hardy highland race, called *Lolo*, of a totally different temper from the other Chinese. Such is their valour, and the strength of their haunts, that even this jealous and despotic government has been, after long effort, obliged to content itself with a formal acknowledgment of homage, leaving the internal government to be entirely conducted by hereditary chiefs, to whom their clans pay almost implicit submission. The metallic wealth of the province is said to be considerable, and even to include gold. The capital, of the same name, once handsome and considerable, has been injured by civil war.

4417. From *Yunan*, tracing the frontier northward, we find *Koeitchoo*, a still ruder province, filled with turbulent and refractory tribes. Its cities are small, being little better than military posts with strong garrisons, which, as the revenues of the province are unequal to support them, prove burdensome to the imperial treasury. It contains, however, a number of valuable metals, particularly copper.

4418. *Sechuen*, the next frontier province to the north, presents a much more favourable aspect. Its mountains are only of moderate height, and it is traversed and fertilised by the great river Yang-tse-kiang. Along with the silk, sugar-cane, and grain of China, it unites the Tartarian commodities of musk and rhubarb, and is also distinguished for a small and active breed of horses. The capital, Tching-tou-fou, though much injured during the civil wars, is still very populous, and carries on a great trade.

4419. *The north-western angle of China* is composed of the province of *Shensee*, which is very extensive, and throws out, as it were, even a long promontory into the Tartarian desert. Its aspect is mountainous, and somewhat rude; but it is highly productive of wheat and millet, and contains copious pastures, on which large herds of cattle are fed. The inhabitants, exposed to perpetual incursions from the Tartars, are trained to arms, and are of a more hardy and courageous character than in other parts of the kingdom. Its capital, Singanfou, is a fine city, strongly fortified, and always well garrisoned.

4420. *Between Shensee and Pechelee*, with which our survey began, the interval is filled by the small province of *Shansee*, which presents an aspect very similar to its western neighbour. The climate is healthy; yielding wheat, millet, and even good grapes, which are not, however, employed in making wine: it has also considerable mines of iron. Tay-yuen-fou, the capital, is distinguished for splendid palaces belonging to a former dynasty, now, however, allowed to go to ruin.

4421. *After making this complete circuit of China*, we have still left the interior provinces of *Honan* and *Houquang*, which compose the centre of the empire. They rank among its finest portions, being watered by the two great parallel rivers, and by numerous tributaries with which they are fed. Houquang has been called the granary, and Honan the garden, of the empire. The former is particularly marked by the vast numbers of lakes which it contains, and which are signified by its very name. That of Tongting is described to be 300 miles in circumference, and covered with numberless vessels, the tenants of which derive their subsistence from its waters. Vouchang, the capital, is an immense city, especially when viewed in combination with Hang-yang, only separated from it by the broad channel of the Yang-tse-kiang. The French writers compare the former to Paris, and the latter to Lyons. Thousands of barks along the whole length of these cities form a continued forest. The towns of Honan are not so distinguished, though that bearing the name of the province has been reckoned by the Chinese the centre of the earth. Kay-yong, the residence of the governor, is defended from the inundation of the Hoang-ho only by strong dikes, which were broken down by the enemy in the last war; a disaster from which it has never fully recovered.

4422. *China*, generally speaking, is a country strictly continental, composed of a rounded range of coast, little broken into bays and promontories. There are, however, several *insular appendages* to it, which deserve notice. Of these, the most interesting are the islands called Loo-Choo, or Leu-chew. The great Loo-Choo is about fifty-eight miles in length, and from twelve to fifteen miles broad; and it is the principal of a group of thirty-six, situated about 400 miles from the eastern coast of China. It is at present tributary to the latter country, though the supremacy has been sometimes disputed by Japan; and from China it also derives its literature. The great island itself is represented as one of the most delightful spots on the globe. According to Mr. Macleod, "the verdant lawns and romantic scenery of Tinian and Juan Fernandez, so well described in Anson's Voyage, are here displayed in higher perfection, and on a much more magnificent scale; for cultivation is added to the most enchanting beauties of nature." The sea breezes, blowing over it at every season of the year, preserve it from the extremes of heat and cold; and numerous rivulets, which seldom or never stagnate into marshes, render it at once pleasant and healthy. The population could not be conjectured; but, from the extent and state of cultivation, it must be considerable. The character of the inhabitants appears every way to harmonise with the charms of their climate and scenery. They are gay, kindly, hospitable, and intelligent. They exhibit none of the recluse and contracted habits of the Chinese, but meet frequently together at little festivals in the open air, and appear peculiarly alive to social enjoyment. They showed extreme attachment to the English, though they still adhered to the jealous precaution of preventing them from penetrating into the country, and even as much as possible from landing: as well as to that of keeping the females secluded from their view. This primitive race appeared, to Captains Macleod and Hall, to be wholly ignorant of the use of money, and without any arms offensive or defensive; but the scrutinising observation of Captain Beechey discovered that in neither respect were they so remarkably distinguished from the rest of mankind. The artillery and muskets of the English, however, were to them quite a new and an astonishing sight; but the employment of the latter against animals caused them such pain, that it was soon discontinued. The people of Loo-Choo are a diminutive race, averaging only five feet two inches high; but stout and well built; their faces rather agreeable than handsome. Indeed, the whole animal creation, except the poultry, is small, but otherwise of excellent quality. This interesting group appears to extend about 500 miles in a direction nearly from south-west to north-east. Captain Broughton, who landed on some of the islands at the eastern extremity, found there the same mild and courteous people with those of the great island.

4423. *The island of Formosa*, called by the natives Tai-ouan, has been chiefly celebrated by the impudent fiction of Psalmanazar. The western part, to which alone the application of Formosa, or *fair*, is applicable, is in possession of the Chinese, and may rank with their best provinces. Its surface is finely diversified, and watered by numerous rivulets descending from the higher parts of the island. Settlements were formed here first by the Portuguese, and then by the Dutch; but both are now expelled. The eastern part, rugged and mountainous, is occupied by races almost savage, who live by hunting, sleep on leaves, have scarcely any clothes or furniture, and tattoo their skin like the rudest of the South Sea islanders.

4424. *Hainan* is a large island, 190 miles in length and 70 in breadth, separated by a narrow channel from the eastern extremity of the province of Quang-tong. Though in view of vessels going to Canton, it is little known or visited. The interior is mountainous; but a great part of the island is moist and unhealthy; and, though the necessaries of life are abundant, the people seem little improved. They are ugly, of small stature, armed with bows and arrows, and wear scarcely any clothes. When Krusenstern visited them, in 1805, they were found subject to the pirates of the *Ladrones*. That group of isles, which must not be confounded with a larger one of the same name in the South Sea, extends close along the coast of China from Hainan to Canton. Their aspect is rocky, bleak, and rugged, like fragments torn from the continent by some violent convulsion, and their sides are dashed with the continual spray of the waves. Although a very small European force would be sufficient to root out the nest of pirates that harbour there, they have continued to defy the whole maritime force of the celestial empire.

4425. Along the coast of Tchekiang extends the almost numberless group of the *Tchusan islands*, of which, in a sail of 60 miles, 300 have been discovered. They are small, not rugged like the *Ladrones*, but verdant, cultivated, and rising from the sea in a conical shape. One of them, called Pootoo, is described as a perfect paradise, and as being occupied by a body of 3000 monks, who have 400 temples, with houses and gardens attached to them. This establishment is richly endowed, and celebrated throughout the empire. There are many fine ports in these islands, and the channels between them are crowded with almost innumerable vessels, carrying on a commerce, of which the centre is at Ning-po, on the opposite coast. The great Tchusan island is about forty miles in length, and about twenty in breadth. It is highly cultivated. Tinghai, the capital, intersected by canals, resembles Venice on a small scale, and presents a crowded scene of busy industry.

CHAP. IX.

THIBET.

SECT. I. *General Outline and Aspect.*

4426. *Thibet*, or, as M. Klaproth has recently called it, *Tubet*, forms a mountain region of a very peculiar character. We have already traced the mighty mountain ridge of Himalayah, forming the whole northern boundary of Hindostan. Parallel to this, at a varying distance, extends another, nearly, if not altogether, as lofty, which the Chinese called the Kuenlun, and at its western extremity, Ksoun-ling, or the Blue Mountains. Towards the east, it penetrates with its snowy peaks the Chinese province of Shensee, being there, too, connected with a mighty circuit of mountains that surround the lake of Kokonor, and, as Humboldt conceives, give rise to the Yellow River. At this eastern portion of the range, the interval which separates it from the Himalayah is of considerable breadth, and includes some fruitful and highly cultivated plains. As the two chains proceed westward, the space between them is gradually narrowed, till, at their extremity, they meet and form one mass with the Hindoo Koh, or Indian Caucasus, which extends thence westward through Independent Persia. M. Humboldt even views the two boundary chains of Thibet somewhat as *débris saillans*, shattered branches from the Caucasus. The Hindoos, who see them in their closest approach to each other, consider both as the Himalayah, and Thibet as only a great and long valley enclosed within this astonishing chain. High detached branches from both of the great boundaries penetrate and encroach upon the territory; yet, wherever the breadth is at all considerable, the greater part of it is occupied by a vast table-plain, the most elevated, perhaps, on the globe, which yields only scanty crops of grain, but is pastured with numerous flocks of animals peculiar to this elevated region. *Thibet* presents a region every way distinct in aspect and character from Hindostan, whence it is separated only by a mountain ridge. Instead of sultry plains, luxuriant harvests, and magnificent cities, appear only rude plains, covered with scanty herbage, and diversified by rocky heights, under whose shelter a few rough-built villages find protection from the chilling winds of the snow-clad mountains.

4427. Besides its grand mountain features, Thibet is distinguished as containing the source of many of the greatest rivers of Asia. The Indus and the Sanpoo, rising near to each other, from that loftiest part of the chain which gives rise, on the other side, to the Ganges and the Jumna, traverse this high plain in contrary directions. The Indus, after draining the waters which descend into it from the western part of both ridges, bursts its mountain barrier, takes a new direction, and flows southward into the ocean. The course of the Sanpoo has not been traced beyond the vicinity of Lassa; and the theory which identified it with the Brahmapoutra has become, at least, extremely doubtful. There seems, however, every reason to conclude, that most of the great rivers which water the empire of China and the kingdoms between it and India, derive their sources from the mountains of Thibet. The Sutledge, the largest tributary of the Indus, also takes its rise upon their border.

4428. *Thibet* contains the lakes of *Manasarowara* and *Rawan Hrad*, picturesque and striking objects, encircled by some of the loftiest snow-covered peaks of the Himalayah, and which are held by the Hindoos in religious veneration; yet they are by no means of great extent. The lake *Tchemarorel*, farther to the west, is similarly described by M. Gerard. The Chinese maps delineate in the north-eastern part the lake of *Terkiri*, seventy miles long, and several others, respecting which no further particulars are yet known.

SECT. II. *Natural Geography.*SUBSECT. 1. *Geology.*

4429. *Gold* is found in grains in many of the rivers, and also disseminated and in masses in quartz rock and other rocks. *Silver ores* are not mentioned by travellers, but some varieties of *galena* contain that metal. Mines of *lead* occur, but they are not worked to any extent; ores of *iron* and *copper* occur in different quarters, and the Thibetians are said to work rich mines of mercury, the ore being *cinnabar*. *Rock salt* is reported to be common; but the most interesting saline mineral met with in Thibet is that named *tincal*, or *borax*. According to Mr. Saunders, the lake from which borax and common salt are obtained is fifteen days' journey north from *Teshoo Lomboo*. Surrounded on all sides by rocky mountains, it receives no rivulets, but is fed by brackish springs rising from the bottom of the lake itself. The borax is found crystallised in the lake, and is taken up in large masses, which are then broken, for the convenience of carriage, and exposed to dry. This mineral, though collected for a considerable length of time, has no appearance of diminishing, and most probably is continually

formed anew. The lake is said to be at least twenty miles in circumference. For a part of the year it is frozen over. In Thibet, as in Europe, borax is employed for soldering, and as a flux for promoting the fusion of gold and silver.

SUBJECT. 2. Botany.

4430. The reader is referred to the remarks under this head at page 965.

SUBJECT. 3. Zoology.

4431. *The Zoology of Thibet and of Tartary* cannot well be separated in a work of this nature, and with the scanty knowledge we yet possess of their productions. We shall therefore enumerate the most remarkable quadrupeds that have yet been found on the elevated deserts of Central Asia.

Georynchus Lagurus. Hair-tailed Lemming.
Vulpes Corsac. Corsac Fox.
Vulpes Karakan. Tartarian Fox.
Putorius alpinus. Alpine Polecat.
Dipus Jaculus. Siberian Jerboa.

Dipus brachyurus. Short-tailed Jerboa.
Dipus minutus. Little short-tailed Jerboa.
Gerbillus Tamariscinus. The Tamarisk.
Gerbillus meridionalis. Torrid Tamarisk.
Lepus Tolai. Mongolian Hare.
Lagomys Ogotoma. Grey Pica.

Equus Hemionus. Mongolian Horse.
Moschus moschiferus. Thibetan Musk.
Cervus Pyargus? Tartarian Roe.
Ovis Ammon. Asiatic Sheep.
Bos poëphagus. Yax Bison.

4432. Several of the above quadrupeds claim a more particular notice; as the Mongolian Horse, the Pica Hare, the Musk Deer, and the Tartarian Roe.

4433. *The Mongolian Horse* (*Equus Hemionus Pall.*) inhabits, in troops, the great central deserts of Asia. It is about the size of an ordinary horse, but is distinguished by having hairs only at the end of the tail: along the back is a black line: the ears in size are rather larger than intermediate between those of the horse and mule: the tail is black, near two feet long, and much like that of a cow. This was probably the wild mule of the ancients. All the proportions of this singular animal exhibit much lightness and elegance. It runs almost literally with the rapidity of lightning, carrying its head erect, and snuffing up the wind: its air is wild and fiery, and the fleetest courser that ever scoured the desert would in vain attempt to overtake it. When unmolested, its character is peaceable and social. Their troops are from 20 to 100 in number, each headed by a chief, who acts as guide and sentinel. It is said to leap three times in a circle round the object which inspires fear. If the chief is slain, which, from his temerity in approaching very near the hunters, will sometimes happen, the troop disperse. The Mongols, the Tunguses, and other Tartar nations bordering the Great Desert, hunt these animals for their flesh, which they highly esteem; but it appears they have never succeeded in taming it.

4434. *The Grey Pica Hare* is not more than six inches long. It is common in the Tartarian deserts, and beyond Lake Baikal. These little animals dig very deep burrows with two or three entrances, furnished at the bottom with a thick and soft bed of leaves; they wander about during night, for they are exceedingly timid, and have many enemies. In spring they begin to cut and lay in their winter provision of tender herbage, &c., which they pile in numerous small heaps, like haystacks, about the entrance of their dwelling, previously filling that as full as it will hold. To the external store of provisions they probably gain access during the deep snows of winter, by undermining it from their subterraneous retreat.

4435. *The Musk Deer of Thibet* (fig. 668.) yields the valuable drug so called. The animal itself is nearly the size of the roebuck. The flesh is esteemed, although strongly impregnated with this scent. When the animal is killed, the bag is cut away, and made into a kind of purse. So powerfully does every part retain this perfume, that even the blood and liver is frequently mixed up with the genuine musk by the crafty Asiatics.

4436. *The Tartarian Roe* is larger than our roebuck. It is marked with a large disk of white on the buttocks, and is remarkable for having no tail: it inhabits the loftiest regions, only descending to the plains in winter: the horns are much branched, and of great expanse.

4437. Among the very few Birds yet brought from these unexplored regions, we may notice two large Pheasants, whose singularity and splendour is almost unrivalled.

HORNED PHEASANT.

4438. The Horned Pheasant (*P. cornutus*), (fig. 669.) in size and general appearance is between the fowl and the turkey: the top of the head is red, and over each eye is a fleshy blue substance, like a horn, and bent backwards: the throat has a bright blue naked flap, marked with orange spots: the breast and back is red: the rest of the plumage deep chestnut brown, marked all over with white spots surrounded with black.

4439. The magnificent Impeyan Pheasant (*Lophophorus refulgens* T.) is larger than a fowl. It is called by the Indians the Bird of Gold: its whole plumage is metallic, reflecting every colour and lustre that can be conceived: the crown of the male is ornamented with several feathers shaped like a lance or arrow, and those of the neck are all pointed. It has been found in the mountains in the north of India, but is very rare.

4440. The domestic animals, among tribes having no fixed habitation, are naturally few. The Tartar Horses appear to be small and ill made, yet docile, and more fitted than any

FAT-RUMPED SHEEP.

others to undergo long and violent journeys without food. The most vigorous are alone preserved; the others are killed and eaten, to prevent them from consuming provender wanted for the rest. The fat-rumped Sheep (fig. 670.) is a breed reared in southern Tartary: the horns are small, or wanting; the ears long and pendulous, and the tail very short and thin. There is another breed, having very broad tails, with four, five, and sometimes six horns; the wool of the first is good, but that of the latter very coarse. The Thibet Goats are well known to furnish materials for those delicate shawls which bear this name: the hair is very fine and long, particularly on the back, and the ears small and pendent.

SECT. III. Historical and Political Geography.

4441. One section may comprehend the very little that can be said on these subjects. Although Thibet be placed amidst nations of ancient origin, its history is almost a complete blank. By the Arabian geographers it is barely named; but, under the name of Tebeth, Marco Polo gives a series of relations which, with a certain tincture of fable, suggest a country not materially differing from that which is now to be described. The ecclesiastical character of its government, and its subjection to a sovereign priest, appear to have favoured a report, that there existed in the heart of Asia a Christian monarch, to whom the early discoverers gave the appellation of Prester John. His sacred character, joined to the strength of the mountain barrier of his kingdom, served in a great measure to the Thibetians as a safeguard against the barbarous tribes by whom they were surrounded. Tradition, however, represents their shrines to have been at different times plundered by the Tartars. The most serious invasion was made in the end of the last century by the aggressive and encroaching power of Nepal. Tempted by reports of the wealth of its temples, and particularly of Pootala, the king of that country marched an army into Thibet, and, after an obstinate war, compelled the Lama to purchase peace by the payment of an ample tribute. The emperor of China, professing to revere that sovereign priest as his spiritual head, determined to interpose on his behalf. In 1791, a Chinese army of 70,000 men arrived at Thibet, and, notwithstanding a very vigorous resistance, drove the Nepalese troops beyond the mountains, from the summit of which the Chinese might even descry the British possessions on the plains below. The Thibetians now experienced the too frequent lot of a weak state which seeks the aid of a stronger. The religious attachment of the emperor to the Lama did not prevent him, when he found the country in his hands, from assuming civil sway over it, and limiting his ally to a spiritual jurisdiction. The whole country is now, therefore, a province of China, which has thus become almost conterminous with the British Indian empire. The sway, however, according to the usual Chinese maxims, is mild, and does not interfere with the original plan of internal administration. The Chinese have only established, along all the Thibetian frontier, that jealous exclusion of foreigners which renders it so difficult to gain information respecting any country included within their territories.

4442. The government of Thibet, so far as it is unaffected by foreign interference, is altogether priestly. The lama, or high priest, is the sovereign, while the successive ranks of monks and gylongs compose the nobility. The laity are the vulgar. It is under the head of religion, therefore, that we must comprehend the political arrangements of this singular country.

SECT. IV. *Productive Industry.*

4443. *Thibet, in respect to agriculture*, labours under great disadvantages. The general character of its soil is bleak, barren, and poor: wheat and barley can be grown only in a few favoured situations, and often fail of coming to maturity. Even the herbage, the most valuable product, though it reaches a tolerable height during the rainy season, from March to September, suffers severely by arid and cold winds, which blow during the remaining part of the year, when it often dries up and crumbles into dust. Yet these mountain pastures possess qualities peculiarly nutritious and grateful, and support numerous flocks and herds. Many species of those especially belonging to Thibet are remarkable for their beauty and value. Indeed, this side of the mountains is alike noted for the profusion of animal as the other is for that of vegetable life. Birds, game, and wild animals of various descriptions, are equally abundant with those trained for the use of man.

4444. Among the numerous animals that enrich Thibet, the most prominent seems to be the *yak*, an animal of the buffalo tribe, but in some particulars resembling the horse. Though not employed in agriculture, the yak is of great value for the conveyance of burdens, and yields also a rich and nutritious milk. Its tail, composed of a mass of long, flowing glossy hair, forms, under the name of *chowrie*, a considerable article of trade. It is in general demand among the great men of India, both as an ornament and as a flap for dispersing insects. Another animal, equally characteristic and useful, is the goat, which yields the fine wool used in manufacturing the shawls of Cashmere. Smaller than the smallest English sheep, it is the most beautiful of the goat species. The wool grows like down, close to the body, and is covered with a profusion of thick and strong hair. This fine covering is evidently given by nature as a fence against the cold, and soon degenerates in any milder climate. Sheep, though certainly not peculiar to Thibet, are here of peculiar value; the mutton being the finest, perhaps, in the world, and the fleece extremely soft and silky. The lamb fleeces, when tanned with the hair, afford linings considered particularly luxurious in China, Tartary, and all the cold districts of Asia. Goats and sheep are used in this country as beasts of burden, in which capacity they follow each other in long trains, and make their way with surprising safety across the most difficult and perilous mountain passes. The musk deer, a product of the chase, is found also in the neighbouring parts of China and Tartary, but is peculiarly abundant and valuable in the high districts of Eastern Thibet.

4445. *This country seems to have been almost as bountifully stocked by nature with mineral* as with animal productions. The imperfect skill of the inhabitants, however, the scarcity of timber, and the difficulty of transport, render the coarser and more useful kinds of little value, unless for immediate consumption. In this view, the most estimable product is gold, which is found nearly pure, in the form of dust, and sometimes in pretty large pieces. Copper is drawn from the mines in considerable quantities as a material for the manufacture of idols, gongs, and sacred instruments. Near Teshoo Lomboo is a mine of lead, obtained by the simple process of fusion. There are also mines of cinnabar rich in mercury, which the natives have not the skill to extract. A most valuable fossil substance is the tincal, said to be deposited at the bottom of a lake, surrounded by lofty mountains in the north-east, and fed by mineral springs bursting forth in its own bed. The tincal is detached in large masses, and, besides those employed for fusion and other purposes, quantities of it are brought by way of Bengal to this country, where it is refined into borax. Rock salt is likewise plentiful.

4446. *The manufactures of Thibet* are rude, and only adapted for immediate consumption; but *commerce* exists on a considerable scale, and under some striking aspects. It is, of course, entirely inland, and carried on through perils and difficulties, only equalled by those, of an opposite nature, to be encountered in crossing the burning sands of Africa. The merchandise must be conveyed over the tremendous steeps and snows of the Himalayah, by tracts rudely formed along the edge of precipices, obstructed by falling rocks and showers of stones, and where the least false step may hurl the travellers into instant destruction. Thibet thus maintains, however, a commerce of some extent, by the export of gold, tincal, musk, shawl-wool, and sheepskins; while from Bengal it imports cloth, particularly woollen, tobacco, spices, and toys; from China, tea, porcelain, and silk. The trade is much impeded by the injudicious system of the chiefs, who monopolise the most valuable articles, particularly musk and wool, and by the disposition generally prevailing among them, rather to carry on traffic themselves, than to protect their subjects in doing so.

SECT. V. *Civil and Social State.*

4447. *Religion forms the essential basis* of the constitution, both civil and social, in this mountain region of Asia. The system which here holds sway is that known in Asia under the title of Boodh, its founder, and of the Lama, its sovereign head; while in China the same worship is denominated that of Fo, and in Tartary is called Shamanism. It had its origin in Hindostan, though now nearly expelled thence by the rival system of Brahma; from which it is generally supposed to have separated as a schism, though others conceive it to have been the parent superstition. It is so far less enlightened, that its objects of worship are mortals exalted into deities, instead of a spiritual and eternal Author of the universe. The doctrine of transmigration is alike held under both religions; but in that of Boodh, it is converted from a speculative belief into a powerful engine of practical influence. As soon as the Lama dies, the priests, by supposed celestial indications, discover an infant into whom his soul is supposed to have transmigrated. This person is immediately exalted into the character of Lama, and in his name all the civil and ecclesiastical affairs of the state are administered. In Thibet and the bordering regions of Tartary, every great district has its Lama; but the chief of these spiritual sovereigns is the Grand Lama, who resides at Lassa; next to him is the Teshoo Lama, resident at Teshoo Lomboo. The latter, at the period of the

English embassy, was only a year and a half old, having but just, it was supposed, had transferred to him the spirit of his deceased predecessor; yet the ambassadors were admitted to an audience, in which he acted his part with surprising propriety. As the sovereignty centres in the Lama, so the nobility is formed by the monks called *jelums* or *gylongs*. The monastic principle exists under the Boodhist system in its utmost rigour, accompanied by the same usages of seclusion and celibacy which distinguish it in the Catholic church. These habits being adopted by the most celebrated characters both in church and state, the idea of dignity is exclusively centred in them, and those of degradation and vulgarity are attached to marriage. The priests reside in large mansions, much the handsomest in the country, and uniting the character of convents and palaces. The monks in the villages bordering on India are represented as a dirty, greasy, good-humoured, happy class of persons, who do not think it inconsistent with their vocation to carry on a good deal of worldly traffic. In the great central establishment, more dignity of character is preserved, and the obligations imposed by their situation appear to be strictly regarded. On the whole, their deportment is represented as humane and obliging; on the part of superiors unassuming, and respectful on that of inferiors. Somehow or other, however, all the wealth appears to centre in them, and a general poverty pervades the rest of the community. The ceremonies of the Boodhist religion bear a striking resemblance to those of the Catholic, insomuch that many of the missionaries found it scarcely possible to discover any distinction. This has even been ascribed by some to a mixture with the votaries of the Nestorian heresy, which was spread through the East. A favourite part of the service consists of music, less remarkable for its harmony than for the employment of every means of raising as great a noise as possible. Not only are all the voices of the congregation put forth, and trained by practice to an almost stentorian pitch, but drums, trumpets, cymbals, hautboys, and other instruments of the most sonorous description, of three or four times the usual size, swell the chorus. One of the favourite exercises of devotion consists in producing by the hand the revolution of a painted wheel with gilded letters, on which the gaze of the worshipper is fixed. Notwithstanding the difference between the religions of this country and Hindostan, many of the temples of Thibet are crowded with Hindoo idols; and the seats of Indian pilgrimage, particularly Benares, Juggernaut, and Sagur, are devoutly visited by votaries from the dominions of the Grand Lama. On their part, the Hindoos pay a deep religious veneration to the lofty snowy peaks and the lonely mountain lakes of this elevated neighbourhood. Among the former, Chumularee, on the Boutan frontier, and among the latter Manasarowara, hold the pre-eminence.

4448. *Of the learning of Thibet* scarcely the least notice has reached us; and yet there appears to be a good deal. The Thibetians

MAUSOLEUM OF THE LAMA.

possess the art of printing, derived, apparently, from the Chinese; since it is executed, like theirs, on fixed wooden blocks instead of movable types. The language has a large infusion of Sanscrit, and is admitted by the Chinese to be superior to theirs in sound, though its characters have not equal beauty. It is written, conformably with the practice in Europe, but contrary to that of the East, from left to right. Turner found the mausoleum of the Lama (*fig. 671.*) filled with high piles of sacred books. M. de Koros, a Hungarian physician, who has resided in the country, and acquired its language, discovered an encyclopædia, in forty-four volumes; and a system of Boodhism, comprising also a general view of the arts and sciences, in 108 volumes. In those discovered among the Calmucks, the Russians complain of impenetrable mystery; but, perhaps, such specimens might not be the most favourable. The Thibetians must have had some skill in astronomical observation, since they were acquainted with the satellites of Jupiter and even with the ring of Saturn.

4449. *In social life*, the most characteristic feature is that unique species of polygamy, peculiarly opposed to the general Asiatic ideas, and consisting in the marriage of one wife to several husbands. All the brothers of a family have only one spouse among them, the privilege of selecting whom rests with the eldest. It seems to be said that a surprising degree of harmony prevails in this extraordinary kind of household: the females, who are active and laborious, enjoy higher consideration than those of India or other Oriental countries.

4450. *The ordinary buildings in Thibet* are very rude, consisting of rough stones heaped together without cement, and with flat terraced roofs. The only thing like ornament consists in a small banner, composed of pieces of rag or white paper, employed as a charm. On the contrary, the religious edifices, which unite the triple character of temples, monasteries, and palaces, display in many instances an extraordinary splendour. That of Teshoo Lomboo,

with its white walls, coloured wooden roofs, numerous gilded canopies and turrets, makes an appearance almost magical; and the apartments are furnished with a regard both to elegance and comfort. That of Pootala, at Lassa, is said, by M. Klaproth, to be 367 feet high, to contain 10,000 apartments filled with images in gold and silver, and to have its roof richly gilded. There, as at Teshoo Lomboo, the state apartments are at the top of the edifice, seven stories high. The villages and monasteries are generally situated about half way up the insulated rocks which diversify the table-plain of Thibet. The rock above shelters them from the cold blasts; that below affords channels by which the melted snow may run off, while in the heart of it granaries and magazines are usually excavated.

4451. *The national dress of Thibet*, contrary to that of India, is composed of thick woollen cloth, and prepared sheepskins with the fleece turned inwards, forming a comfortable protection from the severity of the climate. The religious orders wear a vest of woollen cloth with red sleeves, a large mantle resembling a plaid, with a kilt, and a pair of huge boots. Silks from China, and furs from Tartary, are employed by the higher classes. A fine white silken scarf is an invariable present on occasions of ceremony, and is enclosed in complimentary letters.

4452. The religion of Thibet does not impose the same austere abstinence in respect to *food*, to which the leading castes are subjected under the Hindoo system. A general renunciation of animal food, indeed, would very reluctantly be observed in a country which scarcely affords any other aliment. The heads of the church and state, however, seem to value themselves on great simplicity of diet, and abstinence from strong liquors. Tea is the universal drink, not taken, as with us, in a purely liquid form, but thickened with flour, salt, and butter, the leaves being retained, so as to form a mess by no means agreeable to an European palate.

4453. The entirely religious character of the people of Thibet is scarcely compatible with any very varied *amusements*; though their religious exercises, from their splendour, and their imposing effect on the senses, may almost be accounted as such. The game of chess is well understood, and frequently played.

SECT. VI. *Local Geography.*

4454. *Our topographical knowledge of Thibet* is extremely imperfect, and, unless at a few detached points, can scarcely be considered as having any existence. The missionaries, indeed, found in the Chinese archives a map constructed upon the information of two lamas, who had been sent by that government to make a survey of the country. It contains, at best, mere outlines and names, and is evidently far from being strictly accurate. This defect, partly owing to a civil war which broke out in the course of their mission, particularly appears in the delineation of the course of the great rivers, since the Indus and the Ganges are evidently confounded; the latter being represented as flowing along the table-land of Thibet, and penetrating the Himalayah. Our definite knowledge, therefore, is confined to the very few points which have been visited by European travellers, and to some recent extracts, made by M. Klaproth, from works published in China.

4455. *Lassa, or Hlassa*, the capital spiritual and temporal, "the Rome of central Asia," is situated in the finest part of Thibet, an extended valley bordered by stupendous mountain ranges. The winters are severe; but from April to October, notwithstanding occasional cold blasts, the climate is warm; rice, the vine, and other fine fruits come to maturity. The city, independent of its chief ornament, which is the temple of Pootala already described, is represented as handsome and opulent. In the surrounding plain are twenty-two other temples, all richly adorned, and of which those of Sera and Bhraeboung are described almost to rival Pootala. The entire number of priests and monks maintained at the expense of government is stated at 84,000. Lassa is the seat of the grand or sovereign Lama, from whom all the priests and sovereigns of that denomination, throughout Thibet and Tartary, receive their investiture. He ranked, also, till lately, as the civil ruler of an extent of country about 300 miles in length, and composed of the best territory in this region; but the Chinese, as already observed, after expelling the Nepalese invaders, have established at Lassa a military commander and a civil governor, and virtually annexed it to their empire. They rule it, however, with a mild sway, leaving all the ecclesiastical institutions undisturbed, and in full possession of their ample endowments; and the tribute, conveyed by an annual embassy to Peking, is extremely moderate. Within the district of Lassa, and to the south, is the remarkable lake of Palte, described as forming merely a belt of about four miles broad, round the large interior island which it encloses.

4456. *Teshoo Lomboo* is the seat of a lama, second in rank to that of Pootala, but is rendered interesting to us by its close vicinity to the Bengal frontier, from which it is only

separated by the mountain district of Boutan. Two successive embassies, under Boyle and Turner, have been sent thither, and have made us tolerably acquainted with the place and neighbourhood. About 400 mansions combine to form a large monastery (*fig. 672.*), the walls of which are built of stone, the roofs of coloured wood, and crowned with numerous gilded cano-

672

PALACE OF TESHOO LOMBOO.

pies and turrets. According to the usual system, it is built under the shade of a high rock with a southern exposure, and looks down upon the great river Sanpoo, whose course is here diversified by numerous islands, through which it flows in deep and narrow channels. The number of monks and gylongs, the sole inhabitants of this monastic capital, amounted in 1783 to 3700. Between it and the Boutan frontier is the district of Jhansu Jeung, surrounding a monastery of the same name, and containing a considerable manufactory of that thick soft woollen cloth which is generally worn in Thibet.

4457. *Mr. Moorcroft penetrated at a more westerly point into the region beyond the mountains, called there the Undes, or plains.* He went with the double object of opening a trade in shawl wool, and of viewing the celebrated lake of Manasarowara, and the rivers, if any, which flowed out of it. The only entrance from India is by a narrow and most perilous path, along the precipitous sides of these loftiest mountains of the Himalayah, which give rise to the Ganges. Niti, a village of about sixteen poor houses, forms the frontier point; beyond which, on the Thibet side, the road passes over a tract whose extreme elevation is indicated by its effects on the human body, — oppressed respiration, and a giddiness threatening apoplexy; the blood, at the same time, bursting from the lips, and all the parts exposed to the air becoming red and sore. Here all the tops of the mountains are covered during the night with snow, which melts in the heat of the day, and thus fills the beds of numberless torrents. The first village reached in the Undes is Daba, perched on a number of irregular eminences, and sheltered by a hill of great height. The administration seemed in this region divided between the Lama and the Deba, or civil governor; but the Chinese commands were of paramount authority.

4458. *About eighty miles to the north of Daba lies Gertope, or Gortope,* the chief market for the shawl wool. This place is rather a camp than a town, consisting merely of clusters of black tents made of blankets fastened to stakes by ropes of hair, and adorned at the tops with flags formed with shreds of coloured silk and cloth. It is situated in the midst of a vast plain, covered with large flocks of sheep, goats, and yaks; not fewer, it is supposed, than 40,000.

4459. *About 100 miles to the south-east of Gortope* are the lakes of Rawan Hrad and Manasarowara. The latter, though of smaller dimensions, bears a much greater name, and is an object of reverential pilgrimage from all parts of Hindostan. The few, who can overcome the tremendous obstacles encountered in the way consider all their sins as forgiven, and an entrance into paradise as secured. The lake Manasarowara is of an oval form, about fifteen miles long and eleven broad, surrounded by cliffs of prodigious height, haunted by vast numbers of aquatic eagles and a species of grey wild geese. It is studded with numerous convents, above which the loftiest mountains of the Himalayah rear their snowy pinnacles. It has been generally reported that some great river, supposed once to be the Ganges, and afterwards the Indus, had its source in this lake; and even that the Sanpoo issued from it in an opposite direction; but Mr. Moorcroft could not discern the least trace of any outlet. He was, however, prevented by illness from making the complete circuit in person. The Rawan Hrad was described to be four times as large as the Manasarowara, and is supposed to give rise to the Sutledge; though this, too, seems not fully ascertained. Between these lakes and Daba, the country is filled with hot springs, largely impregnated with calcareous matter. Those at Tirtapuri throw up the water, which is intensely hot, to the height of a few inches.

4460. *It appears that, though not from the lake Manasarowara,* yet from some of the mountains in its vicinity, the main branch of the Indus takes its rise, and, after passing Gortope, rolls to the north-east, for more than 300 miles, till it passes *Leh* or *Ladauk*. This province, the most westerly of those which have been included in Thibet, appears to be rude and decidedly Tartar. The Ladaukis have held themselves independent of China, and were accustomed to lay waste the Undes by frequent inroads, till the Chinese government adopted the expedient of assigning that territory in jaghire to the Grand Lama, who is held in such reverence by the Tartar tribes, that they have been induced to desist from their ravages. They have stipulated, however, that the shawl wool sent from the Undes to its market in Cashmere shall be conveyed exclusively by the route of Ladauk. The town of that name is the seat of a considerable trade, being the place of transit for the caravans which come along both sides of the valley of the Indus, from Thibet, Hindostan, and Cabul. It is stated by Humboldt to bear the name of Tubet, and, perhaps, has communicated that appellation to the whole region. To the north ascend the snowy steeps of the Mooz Tagh, whence descends a rapid stream, called the Shayook, which joins the Indus at Ladauk. About 100 miles to the west, at Dras, that river is joined by another tributary from the south-east, which has been sometimes considered as the main stream.

CHAP. X.

TARTARY.

4461. *Tartary* is the name given in Europe to that immense region extending almost entirely across Asia from the Caspian to the Eastern Ocean. It is the second of the three great belts into which that continent is portioned out. Although the name of Tartary be only partially recognised within these limits, and though, in so vast a region, much diversity of every kind must necessarily exist, the general similarity is striking. Many parts of it are bordered, and even pervaded, by chains of mountains; and large cities, cultivated spots, and fixed societies here and there occur. It contains also sandy deserts of considerable extent. Still, the predominant characteristic is that of plains almost boundless, covered with herbage more or less abundant, and occupied by wandering and pastoral tribes, whose camps, like moving cities, pass continually to and fro over its surface.

SECT. I. General Outline and Aspect.

4462. *The surface of Tartary* consists of bold and strikingly contrasted features, on an immense scale: in the east, long and lofty chains of mountains supporting very elevated table-lands; in the west, a plain of astonishing extent. The researches of Humboldt and his

learned coadjutors have thrown great light on the configuration of this great region, which was before involved in much obscurity.

4463. *Three great chains of mountains*, running from east to west, traverse the wide expanse of Eastern Tartary. Two of these are limitary; one, the Kuenlun, already described, which separates it from Thibet; the other the Altaï, dividing it from the bleak regions of Siberia. This last remarkable chain extending eastward under the titles of the Sayanskoi and Yablonoy mountains, is prolonged almost from the sources of the Irtysh and the Obi to the Eastern Ocean. The intermediate chain, which is wholly Tartar, and divides the country into two great table-lands, is called by the Chinese the Thianchan, or the celestial mountains. This range, hitherto imperfectly distinguished from the Altaï, appears to reach its highest pinnacle to the north of Turfan and the lake of Lop, where three peaks covered with perpetual snow are celebrated under the title of the holy mountain (Bokhdaoola), or of "the mountain of the queen." Hence Pallas, who erroneously views this chain as part of the Altaï, has given to the whole the name of Bogdo. The Turks have attached the appellation of Mooz Tagh, or snowy mountain, to its western portion, where it stretches beyond the general range, and shoots a branch towards Khojend, separating the sources of the Oxus from those of the Jaxartes. Here the lofty peak termed the throne of Soliman, and several others, appear covered with perpetual snow. Considerable mountains also occur north of the Jaxartes; but all these gradually sink into the vast low level of western Tartary. Eastward, near the frontier of China, this elevated range declines, partly into the great desert of Cobi, partly into a lower range separating that empire from the country of the Mandshur Tartars. The boundary in that direction is formed by the transverse chain of the Khingkhanoola, beyond the meridian of Pekin, which runs from south to north, and probably connects it with the branches from the Altaï. At the western extremity, the plain enclosed between the Thianchan and Siberia, is believed to be entirely open, and connected with that of Independent Tartary. It is otherwise with the plateau south of the Thianchan, and separated from Thibet by the Kuenlun. The extremities of these two boundary chains are connected by a transverse one called the Beloor or Bolor, of a peculiarly lofty and rugged character, and affording only two narrow and difficult passes, by which caravans can penetrate into Eastern Tartary. This remote corner of Asia is distinguished by valuable mines of ruby, lapis lazuli, and other precious stones.

4464. *These three mighty chains enclose two great table-lands*, of which the Thianchan forms the central and common boundary, whence the southern extends to the Kuenlun, and the northern to the Altaï. The former, commonly called Little Bucharïa, is very imperfectly explored, not having been traversed for several ages by any European; but it is known to contain several states that have risen to a considerable height of culture and civilisation. An impression has prevailed, as if this were the most elevated plain on the globe; but Humboldt observes, that a country in the fortieth degree of latitude, where cotton, the vine, and the silkworm come to maturity, can scarcely exceed in elevation the plateaux of the Mysore, Spain, and Bavaria. The northern table-land, called commonly Mongolia, is, probably, nearly similar in elevation; but, being in a more northerly situation, its climate is much more bleak and ungenial: it yields, in its best tracts, only pasturage, and includes large expanses of sandy and saline desert. The country still farther to the eastward, occupied by the Mandshur and other tribes of Tartars, is still more imperfectly known, but appears to consist, likewise, of an alternation of mountain and table-land, bearing still more decidedly a rude and pastoral character.

4465. *Western or Independent Tartary* presents an aspect entirely different; and, as the one is supposed to rise higher, this is believed to sink lower than any tract on the surface of the globe. A few branches, indeed, from the lofty mountains, which give rise to the Oxus and the Jaxartes, penetrate its border; but in extending westward to the Aral and the Caspian, the surface declines lower and lower, till a great extent of it is believed to be 200 or 300 feet beneath the level of the sea. It consists generally of a vast and monotonous level, which by the scarcity of water is rendered in many places almost a desert; and the fine countries fertilised by irrigation from the great rivers, are little better than large oases amid a greater surrounding waste.

4466. *A considerable number of rivers* descending from these high mountain ranges traverse the great upland plain of Tartary; but, unable, across so many barriers, to reach any of the surrounding oceans, they expand into large interior salt lakes, whose magnitude entitles them to the appellation of seas. The Caspian, indeed, the largest inland sea on the globe, is fed, not from Tartary, but by the Volga and the torrents of the Western Caucasus. The Aral is the receptacle of the two great characterising rivers of Tartary, the Oxus or Amur, and the Jaxartes or Sirr, which rise in different parts of the transverse chain of the Beloor Tagh. Thence flowing westward through the long tracts of Independent Tartary, they fall into the Aral, either by two separate channels, or one united stream; for this is still an undecided point of Eastern geography. The Oxus seems to hold a course of about 1000 miles, and the Jaxartes of more than half that length. Along and between these streams are situated the most fertile and populous tracts, and the most powerful states, of Western Tar-

tary. In little Bucharia, another series of rivers, flowing eastward from Aksou, Cashgar, and Yarkund, unite in the Tarim, which proceeds in the same direction towards the great lake of Lop. To the north of the Thianchan, the Ili, a considerable stream, flows westward into the lake Balkash or Palkati. Several other rivers traverse this part of Asia, and expand into lakes. The Irtysch, Angara, and Selinga, though they rise in this region, soon break the northern barrier, and roll through Siberia. Eastern Tartary is watered through nearly its whole length by the Amoor or Saghalien, which, after a somewhat winding course, falls into the long narrow strait that separates the continent from the island of Saghalien. It may vie in magnitude with the greatest Asiatic streams; but, from its unfavourable position, it conduces little to the interests of commerce and communication.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

4467. *The central and interior portion of Asia*, which forms neither an immense cluster of mountains nor a continued table-land, is crossed from east to west by four grand systems of mountains: these are, the Altaï, the Thian-chan, the Kuenlun, and the Himalayah. The *Altaïan chain* exhibits magnificent displays of primitive and transition rocks, which are more or less deeply covered with secondary and tertiary deposits. The metallic wealth of this range is great; for, independent of other metals, it affords annually 70,000 marks (a mark is equal to 4608 grains) of silver, and 1900 marks of gold. The geology of the system of the Thian-chan is not known; and we are equally ignorant of the geognostical structure and composition of the Kuenlun. The little that is known of the Himalayah range is noticed in our account of Hindostan. It is worthy of remark, that ancient volcanoes, and some in a state of activity, have been met with in Central Asia. The most remarkable volcanic mountains are Pechan, Houtcheou, Ouroumptsi, Kobok, and Aral-toube. These mountains, along with other similar tracts, form a volcanic territory, the surface of which is upwards of 2500 square leagues, and which is distant 300 or 400 leagues from the sea. Vast quantities of sal ammoniac are collected in this volcanic region.

4468. *Great western Asiatic depression.* The Caspian Sea and the Lake Aral occupy the lowest part of this great depression, whose surface is probably 18,000 square leagues in extent, and which lies between the Kooma, the Don, the Volga, the Yak, the Obsheysyrt, Lake Aksakal, the Lower Sihon, and the Khanat of Khiva, upon the shores of the Amoodavia, and whose surface is situated below the level of the sea. This very low country abounds in tertiary formations, whence proceeds melaphyre, and in debris of scorified rocks, and offers to the geognostic enquirer, from the constitution of its formations, a phenomenon hitherto almost without parallel on our globe. To the south of Baku, and in the Gulf of Balkan, this aspect is materially modified by volcanic forces. On both sides of the isthmus between the Caspian and Black seas, naphtha springs and mud volcanoes are numerous. The mud volcano of Taman is a dependency of Baku, and of the whole peninsula of Absheron. Eruptions take place where the volcanic forces encounter the least opposition. On the 27th November, 1827, crackings and tremblings of the earth, of a violent character, were succeeded, at the village of Gokmali, in the province of Baku, eight leagues from the western shore of the Caspian Sea, by an eruption of flames and stones. A space of ground, 290 toises long and 150 wide, burned for twenty-four hours without intermission, and rose above the level of the neighbouring soil. After the flame became extinct, columns of water were ejected, which still continue to flow.

SUBSECT. 2. *Botany.*

4469. The reader is referred to the remarks under this head, at page 965.

SUBSECT. 3. *Zoology.*

4470. The *Zoology* of this country is described with that of Thibet.

SECT. III. *Historical Geography.*

4471. *The Scythians of the ancient world*, the Tartars of modern times, have maintained in all ages an unchanged character. In war, their name has always been memorable. Their rapid inroad, their sudden and desultory attack, their flight which defied pursuit, enabled them to baffle all attempts to effect their subjection, though made by the greatest conquerors of antiquity. In those ages, however, their power was chiefly displayed in maintaining their rude independence, and occasionally committing extensive ravages on the more favoured regions subject to the great empires. They could not, except in one instance recorded by faint tradition, reduce their conquest to any permanent subjection. The clouds of arrows which they shot flying, though they might harass, could not vanquish in regular battle, the well-armed and better disciplined troops of the great military nations. The tide of Arabian

invasion, which reduced to subjection the countries beyond the Oxus, appears to have first caused a reaction. The Turks from the countries beyond the Jaxartes poured down in vast bodies, and not only drove the Arabian invaders out of central Asia, but over-ran the greater part of Persia, which the Turkish princes of the race of Seljuk governed for the greater part of two centuries. Even after being expelled by subsequent revolutions, they found a home in Asia Minor, where, being recruited by voluntary levies, they, at length succeeded in subverting the Greek empire of the East. Tartary began now to wield entire the destinies of Asia. In the thirteenth century, Zingis Khan rallied round his standard the tribes of Mongolia, of the same race with those who had formerly, under the name of Huns, and under the command of Attila, ravaged the remotest countries of the West. After having assembled under him all the native bands, he began the conquest of China; which was completed by his successors, who afterwards added Western Tartary, and Persia with all its appendages; so that, with the exception of India, they reigned almost the supreme and sole rulers of Asia. To this immense dominion they afterwards added Russia and part of Poland, while Hulagou subverted the throne of the caliphs. The empire of Zingis, however, was divided among his sons, the Tartaric part forming what was called the empire of Capschak, while distinct branches ruled over Persia and China. This order of things continued till the rise, in the fourteenth century, of the empire of Timur. This prince, taking advantage of the dissensions which reigned among the posterity of Zingis, successively overcame them, and on their ruin erected a new empire, as splendid as that which he had subverted. He conquered Persia, overcame and made prisoner the proud Bajazet, and crushed for a time the rising power of the Turkish Roumelian kingdom. But India was the most splendid and permanent acquisition of the house of Timur, and, under the title of Mogul emperors, they reigned over it, long after the vicissitudes of fortune had obliged them to quit hold of their original seats.

4472. In the last two great revolutions the conquerors had belonged to the race of Mogul or Mongul; but the Turks, or Toorks, who had begun the career of conquest, again appeared on the field. Pouring in vast bodies from the least known part of interior Asia, they over-ran all the fine country on the Oxus and Jaxartes, and carried their arms as far as the grand range, the Hindoo Koosh, which separates Tartary from Cabul. They have not as yet made any attempt to pass that barrier, or to grasp any of the southern sceptres of Asia. The whole Turcoman tribes, indeed, have never been united under one head, but have been divided into several distinct monarchies, of which the most powerful and flourishing are those of Bokhara upon the Oxus, and of Kokaun on the Jaxartes.

4473. *Eastern Tartary*, meantime, had effected by conquest an important revolution. China, the most valuable possession belonging to the posterity of Zingis, had remained to them after every other had been wrested out of their hands; but at length they were so far weakened by ease and prosperity, that even that timid nation succeeded in driving them out, and re-establishing a native dynasty. This was a situation, however, in which China was not destined long to remain. In the sixteenth century, the Mandshurs succeeded in again reducing it under a Tartar yoke. To the empire thus formed were speedily annexed, not only the original conquering state, but the whole of Mongolia as far as the frontier of Asiatic Russia, and all the interior countries of Tartary to Beloor Tagh and the boundary of the Uzbeks. Over all these countries China has established a very mild sway, leaving the internal administration almost wholly in the hands of the natives, and not scrupling to procure the submission and peaceable behaviour of the wandering tribes by paying rather than receiving an annual tribute.

SECT. IV. *Political Geography.*

4474. *The government of all the Tartar races* presents a singular phenomenon. This bold and rude people, who seemed to set the whole world at defiance, are yet subject to a despotism as complete as that established in Turkey or Hindostan. As this cannot be placed to the account of any thing timid or effeminate in their nature, it must arise from some other principle in the human mind. The Tartars do not, like the shepherds of a civilised country, lead their flocks through remote and sequestered valleys, and spend their days in peaceful seclusion. They move from place to place, usually in large bodies, united for some purpose either of war or plunder. It has been always found necessary that the leader of a military enterprise should be invested with discretionary powers. The habitual exercise of these powers, with the attachment and admiration generated in the minds of the followers whom he had guided with success in a series of such expeditions, give him, by degrees, a permanent claim to supreme authority. The same tendency is greatly aided by the superstition incident to a barbarous people, whose creeds, all derived from the south, are accommodated to the system of absolute power there prevalent. Under the character of mollahs and of lamas, many of the princes of Asia preach and rule. Although, however, every thing in these states owns the supreme law of the sovereign, minute inspection discovers in the inferior branches indications of aristocratic and even of

popular influence. Each nation is formed by an aggregation of clans or *oorooghs*, the members of which are united to each other by strong hereditary ties. Over each *ooroogh* is a chief, who, according to Mr. Frazer's account, is, in Tartary as well as in Cabul, elected in many instances by the body of the clan. This chief administers all its internal affairs, and arranges the quotas of tribute and military service exacted by the general government. The general heads of clans, however, do not unite in any assembly, or claim the right of exercising any regular control over the measures of the sovereign.

4475. *The vast tracts under Chinese dominion*, composing about two thirds of all Tartary, are subject in a manner to despotism over despotism. The people are despotically ruled by their native prince, while he is held in complete thralldom through the military occupation of his territory by a foreign power. Yet the sway of this great empire is said to be singularly mild, and even auspicious to the rude realms over which it extends. It prevents their bloody internal contests, their roving propensities, their predatory habits; it promotes the influence of order and industry. In the flourishing districts of Cashgar and Yarkund, it is even said to have generated such an attachment among its subject tribes, that, far from feeling any inclination to shake off the yoke, they would even fight with zeal in its cause.

4476. *The military force of all the Tartar states* consists of cavalry, which for the strength of the horses, the hardihood of the troops, their endurance of fatigue, and even their valour in a tumultuary shock of battle, are scarcely equalled, perhaps, in the world. If Bokhara, Kokaun, and the other kingdoms of Independent Tartary, were united under one head, they would muster about 300,000 such horsemen, well mounted and well conditioned, and might renew the ages of Tartar conquest. Yet a mere tumultuary host of this nature, without infantry and without artillery, would probably, if brought into contact with a force either European, or trained after the manner of Europe, be wholly unequal to the contest.

4477. *As Tartary is divided into a number of separate states*, connected only by the general similarity of institutions and habits, the details of the power, revenue, and administration of each, so far as they can be ascertained, must be given under the local section.

SECT. V. *Productive Industry.*

4478. *Tartary*, with some local exceptions, is a poor country, scarcely affording to a thin population the mere necessities of life. Articles of luxury it does not produce; and it affords few others for which they could be received in exchange. Whatever of splendour has shone in the courts of Karakorum or Samarcand, has been wrested, by the sword, from their effeminate possessors in southern Asia. Conquest, indeed, no longer enriches Tartary; but the plunder of caravans, or the booty swept together in long *chepaos*, or forays, forms still the chief source of wealth to its petty khans and chieftains.

4479. *In regard to agriculture*, although in some favoured districts there are fixed tribes who cultivate the ground, the general aspect of modern as of ancient Scythia, is that of a pastoral region. The horse is the wealth and strength of Tartary. Those, however, for which this region is so famous, display neither the elegance, the airy lightness, nor the almost preternatural swiftness of the Arabian steed. They are inferior in these respects even to those of Persia and the Deccan. They are of great weight, with long bodies and large limbs. Their merit consists in what is called *bottom*; in the power of making immense journeys, without pause or fatigue; and by this quality they wear out, at the long run, their swifter adversaries. According to Mr. Fraser, their powers of endurance on these long expeditions are by no means promoted by setting out in good condition. On the contrary, they are studiously reduced, till they become almost skeletons, and their flesh feels like marble; after which they will perform continued journeys of seventy or eighty miles a day without injury. They form a regular article of trade, and are in great demand for the cavalry of Persia and India. They are used, however, not merely as instruments of war and plunder, but also for economical purposes, and particularly for food. Horse-flesh, from one end of Tartary to the other, is the standing dish; and mares' milk, fermented into a liquor called *koumiss*, is almost the only liquor used for convivial purposes. The other animals of Tartary are more local, and chiefly borrowed from the adjoining districts. Eastern Tartary has in the south, the yak, the goat, and the musk-rat of Thibet; in the north, the fur-bearing animals of Siberia; but neither in such perfection as in their own proper districts.

4480. *The vegetable productions* which are the objects of culture in Tartary do not materially differ from those of Europe: in the southern and milder tracts are raised wheat, barley, and millet; while the ruder northern districts, particularly of Mandshur Tartary, scarcely yield any grain except oats. On the declivities, however, of the great chain which separates Tartary from Siberia, are found some valuable and peculiar products; the rhubarb, so useful as a medicine, and which has been transplanted into Europe, without attaining the same excellence; and the *ginseng*, which, though it has never been valued among us, is in China and Tartary held of sovereign virtue.

4481. *Manufactures* cannot be said to have any national existence in Tartary, though here, as every where else, the women produce some coarse fabrics for internal consumption. Among these, the principal are felt, coarse woollens, and skins, particularly of sheep, variously prepared.

4482. *Commerce*, over this vast region, is on a scale not quite so limited; resting, indeed, on other resources than its own exports and imports, which are of very small amount. These wide open plains have in all ages formed the route of communication between Eastern and Western, and of late between Northern and Southern, Asia. Notwithstanding the multiplied obstacles of mountains, deserts, snows, and the more deadly impediment of barbarous nations devoted to plunder, caravans proceeding by this route have always exchanged the products of Persia and Hindostan for those of China. To avert the perils that await them, they proceed in large bodies, well armed, and purchase the protection of the princes through whose territories they pass, and who, indeed, if at all enlightened, seek rather to encourage this system of transit. Even, in the fourth century, we find Ptolemy describing an immense caravan route across Asia from Byzantium to the frontier of China, and which probably existed long before, though it escaped the notice of earlier writers. This route varies with the disturbed or peaceful state of the countries which it traverses; but its favourite points of rendezvous seem to be Herat (ancient Aria), Balkh (Bactria), and, above all, Yarkund, situated on the line which separates Eastern from Western Tartary. The tract beyond may be considered almost as unknown land, since it has been but loosely described by one or two travellers, whose narratives are several centuries old. They mention Khoten, Koutché, Turfan, and Hami, as important points to be passed; but this route is rendered arduous by the necessity of crossing the great desert of Shamo or Cobi, which extends here for a vast distance from north-west to south-east. Of late, the Russians have opened a great trade across Independent Tartary. They have annual caravans from Orenburg to Bokhara, a commercial route, which Britain

vainly attempted to open, for several centuries; and these caravans, it is said, consist frequently of 30,000 men. They frequent also the fairs of Yarkund, and some of them have even been seen in those of Thibet. From all that part of Tartary, however, which is subject to China, they are rigidly excluded. The only communication between the empires is on the frontier of Siberia, at the two towns of Mamaitchin on the Chinese, and Kiachta on the Russian side. Here the commodities of the respective empires are exchanged, under those strict regulations by which China limits all her intercourse with foreigners.

4483. *The chief trade peculiar to Tartary* consists in its horses, the superior qualities of which have already been noticed. There is a small, stout, hard-working breed, selling from 5*l.* to 10*l.* apiece, exported to Cabul, and some parts of India, for purposes of husbandry. The large war-horse of Turkestan has been always in request for the cavalry, of which the armies in Hindostan and all the south of Asia chiefly consist. The demand, however, has been much diminished in India by the prevalence of the English, whose troops consist chiefly of infantry, and whose officers prefer Arabian horses.

SECT. VI. *Civil and Social State.*

4484. *The population of the tribes roving over the boundless plains of Tartary* cannot be estimated from any precise data, nor can a loose conjecture on the subject be hazarded with much chance of coming near the truth. The population of Bokhara has been stated at 3,000,000, that of Kokaun at the same, that of Balkh at 1,000,000. Badakshaun, Khiva, the Kirghise territory, and other minor divisions, may raise the whole of Independent Tartary, perhaps, to somewhat above 10,000,000. In regard to what is called Chinese Tartary, we are destitute of all positive data; but if we suppose the same ratio to prevail between the extent and population, we must allow to this portion double the number. Against this allowance, it may be argued, that Eastern Tartary contains immense tracts of desert, and thinly inhabited country. It is not certain, however, that these are more extensive than in its western regions; and our accounts of it, which must be confessed to be imperfect, represent various districts as fertile and highly cultivated. Under these views, we might guess the entire population of Tartary at about 30,000,000.

4485. *The Mongols and the Turks, or Toorks, the two leading races* among the various tribes who inhabit this immense region, are distinguished by numerous peculiarities from each other. The Mongols, so celebrated in the annals of conquest and ravage, both under their own name and the ancient name of Huns, occupy chiefly the pastoral districts bordering on the north upon the great desert of Shamo. Their visage is strange, and almost deformed; broad, square, and flat, with high cheek-bones, the nose peculiarly depressed, small and keen black eyes, bending obliquely towards the nose, thick lips, and a scanty provision of black hair upon the head, eyebrows, and beard. Their persons are somewhat diminutive, spare, muscular, and active, and the horses on which they continually ride are more distinguished for swiftness than for size and beauty. The Calmucks, the Kalkas, the Eluths, the Burats, may be considered as branches of the great Mongol family. The Turks, celebrated for their early conquest of Persia, and for their possession of Constantinople, are a much handsomer race. They have short and stout persons; broad foreheads, high cheek-bones, small but not twisted eyes, and black hair. Their features cannot thus be considered as perfect, according to European ideas; but as they have none of the Mongol deformities, and, instead of the dark-yellow tint of the latter, have clear and ruddy complexions, their beauty is celebrated by the poets of Asia. They are divided chiefly into the Uzbeks, the Turkomans, the Kuzzauks. The Mandshurs are represented by some as exhibiting the Mongol features, with a fairer complexion; but, according to Pallas, they belong to the same class as the Tunguses. Although there be this variety in the external appearance of these races, yet the same wandering, pastoral, equestrian habits; the division into tribes; and the absolute sway of their khans, unite in fixing a similar character on all the nations who bear the name of Tartar.

4486. *Of the national character of the Tartars* very various reports have been given, according to the relation under which they have presented themselves. Their delight is in war, and there is no nation that wages it on a more dreadful and barbarous system. The "scourge of God," the "terror of mankind," are the appellations by which they are known to the neighbouring empires. General extermination, without regard to age or sex, is what they consider themselves entitled to inflict on all who attempt resistance; and this is mitigated only when a profit can be made by carrying off captives, and selling them as slaves. It was said of the armies of Zingis and Timour, that they saw before them a fruitful kingdom, and left behind them a solitary desert. It was their boast, with regard to some of the proudest capitals, that they had reduced them to such a state, that a horse might pass over their site without stumbling. A picture greatly the reverse of this has been drawn by those who have observed the Tartars, even when they were spreading elsewhere the widest desolation; displaying, in their domestic life and their intercourse with each other, the simplicity and amiable virtues of the pastoral age. They are cordial, kind, and hospitable; quarrels are rare, seldom produce fighting, and scarcely ever bloodshed. Compared with the Hindoos and Chinese, they are frank, sincere, and honest; and though they make even peaceable strangers feel the influence of a national pride, nourished by the recollection of so many victories, yet they protect them, and treat them with courtesy.

4487. *Two religions divide Tartary*, and are professed with zeal through different portions. All its eastern regions acknowledge the Shaman doctrines, and the supremacy of the Grand

Lama; while, ever since the commencement of the eighth century, when the countries beyond the Oxus were conquered by the arms and instructed by the preaching of the caliphs, they have remained devoted to the Mussulman creed. Under the former system, the little tribes of Eastern Asia have minor lamas, exercising a mingled spiritual and temporal jurisdiction, though not holding a supreme sway in either capacity. The original Boodhist system, also, here seems combined with ruder features; particularly magic, sorcery, and similar modes of deluding the ignorant wanderers of the desert. In the west, again, Mahometanism seems to be professed in greater purity, and with stronger bigotry, than in almost any other of the numerous regions where it reigns. In Bokhara, the reigning sovereign raised himself from a low rank to that high station, solely by his eminence as a mollah, or Mahometan doctor, and by his rigid observance of the austerities enjoined in that religion. The Koran is here strictly enforced, not only as a sacred but a civil code: according to its rules justice is administered and the revenue collected; and, conformably to its precepts, a tenth part of the revenue is bestowed in alms. The prohibition of wine, and even of tobacco, is enforced with the utmost rigour. Kilich Ali, the able and equitable ruler of Balkh, equally aspires to distinction as a Mahometan saint. He bestows large sums in maintaining mosques and mollahs, feeds daily a hundred poor, and affects the humility of never riding on horseback, lest his feet should at any time be higher than the head of any true believer.

4488. *The learning of Tartary* is little known, and is at best only a reflected light from the southern regions of Persia, Hindostan, and China. Yet the country is by no means involved in that thick darkness which the name Tartar suggests to an European ear. In all the Mahometan states, some of the first elements of knowledge are very widely diffused; and the few great cities contain colleges for instruction in the sciences, on as extensive a scale as those of Europe. Unfortunately, the sciences there taught form a contracted and monastic circle, nearly similar to what was professed in Europe during the middle ages. Commentaries upon the Koran take the lead of every other class of literature; and as that rude composition is the standard of Mussulman law as well as theology, the science of jurisprudence can never assume any liberal aspect. Astronomy appears merely under the character of astrology; medicine has lost all the lustre it possessed in the days of Avicenna; and, perhaps, the only solid parts of knowledge retained of those which were taught in the schools of Bagdad, are arithmetic, and the branches of practical mathematics.

4489. *Architecture*, in a country of which the greater part of the population is movable, can never be expected to make much progress. The great capitals are decorated with handsome edifices, on the model of those of Persia; but none of these have attained any great celebrity. The regular abode of all native Tartars is the tent, carried from place to place with the tribe or encampment. The Tartar tent is much more commodious than that formed of black cloth, which is used in Cabul or Thibet. It is framed of close lath or wickerwork, covered with felt, and terminating upwards in the shape of a dome. These, which are often large and lofty, are placed on waggon, and conveyed from place to place, suggesting the idea of a moving city. A camp or migratory village is called *onoöl*, and consists usually of from twenty to fifty tents.

4490. *The dress of the Tartars* differs materially from that of Southern Asia, and is chiefly adjusted for the production of that comfortable warmth which the climate renders desirable. The Turks wear a cotton shirt and trousers, a silken-woollen tunic, tied with a girdle, and over it a gown of broad cloth or felt. The national head-dress is a large white turban, drawn, in general, over a *calpauk*, or pointed cap. Boots are worn at all times by all classes, poor and rich, men and women, but the rich have them of a sort of light leather, without soles or heels, forming rather a species of leather stocking, over which shoes must be worn when they go out. Every man has a knife hanging from his girdle. The women wear nearly the same garments as the men, but longer, and throw a robe of silk or cotton over all. They delight in gold and silver ornaments, and plait their hair into a long queue, like the Chinese. In Mongolia, sheepskins, dressed in a peculiar manner, with the hair inwards, are considered the most comfortable protection against the cold; and some furs, though not of the finest kind, from either Tartary or Siberia, are added.

4491. *The favourite food of the Tartars* is horse-flesh, so repugnant to the taste of all other nations. The varied delicacies which cover the tables of the great in Persia and Hindostan are considered by them as very insipid when compared with a stew of this coarse aliment. Horses there, as oxen with us, are regularly fattened for the tables of the rich; but their limited number, and the higher services to which a large proportion must be put, place this delicacy, in a great measure, beyond the reach of the poor. They can enjoy it only occasionally in winter, when the scarcity of pasture obliges the camp to kill such as they are unable to subsist. Among the wandering tribes, however, an animal diet must preponderate, both from its abundance and the want of any other; but, in the absence of the above most valued kind, recourse is had chiefly to mutton. To the horse, the Tartars are also indebted for their most national and characteristic liquor. The milk of the mare is fermented into an intoxicating drink, called *koumiss*, which is their favourite beverage, and which physicians have described as really very palatable and wholesome. The stern precept of the Koran is, by a Tartar interpretation, not considered as applying to this exhilarating fluid, in which the Turks, notwithstanding general habits of sobriety, indulge nearly to the utmost extent in which it can be procured. They use also bouza, a thin acidulous liquor, made from grain, and which is likewise much drunk in Arabia and Northern Africa. They breakfast on tea, which, after the mode of Thibet, they make into a thick liquid, with milk, flour, and butter.

SECT. VII. Local Geography.

4492. *The most eastern division of Tartary*, or the country of the Mandshurs, forming the interval between China and Siberia, and bordered by the Eastern Pacific, is still less known than most of its other regions. We scarcely know it at all, unless by Chinese descriptions, which are in general meagre and pompous. It presents generally a different aspect from those immense and naked plains which characterise the centre of Asia. It appears to be diversified by rugged and broken mountain ranges, covered with thick forests, and separated by valleys, many of which, notwithstanding the coldness of the climate, possess considerable fertility. Their recesses are filled with wild beasts of a formidable character, and in such crowds as to render travelling dangerous. Wheat is raised only in the most favoured spots; the prevalent culture is that of oats, elsewhere scarcely an Asiatic grain. The product most valued abroad is the *ginseng*, the universal medicine in the eye of the Chinese, who boast that it would render man immortal were it possible for him to become so. It grows upon the sides of the mountains. The shores of the Eastern Ocean appeared to La Pérouse covered with magnificent forests, but abandoned to nature; a singular circumstance in a region so closely bordering on the over-cultivated and crowded empire of China. The few inhabitants do not even hold any intercourse with its civilised districts; but subsist on fishing, and live entirely independent, but display a mild and excellent disposition. The great river Amoor, after rising in Mongolia, traverses the whole of this province, receiving from the south the large tributaries of the Usuri and the Songari. It abounds with fish of the finest kinds, of which the sturgeon, in particular, is found in matchless abundance and perfection.

The lands upon its shore ought also, it should seem, to possess ample capacities of culture. Yet they are occupied merely by tribes of poor and wandering fishermen, and for a great extent, near the mouth, are almost a complete desert. The very few towns that exist are inhabited chiefly by Chinese, defended by Tartar garrisons. North of the Amoor, the country is Siberian, and is filled with a race of hunters, who find many valuable fur-bearing animals, among which the sable is conspicuous.

4493. *The Mandshurs* are by no means wholly destitute of civilisation. They possess even a language and writing, essentially different from that of the Chinese, or of any other nation of central Asia. The language is distinguished by an excess of smoothness, which forbids two consonants ever to come in contact with each other; by a copiousness almost unrivalled; by the very varied inflections, particularly of the verb. Philologists have traced in it analogies with the languages of Southern Asia, and even with the cognate dialects of Europe. This refinement, however, seems to belong rather to some other era, or to have been imported from some other region; for the impression which Sir George Staunton received of these Tartars, immediately after he had crossed the Great Wall, was that of a very rude people. Their persons were tall and robust; but their countenances were less expressive than those of the Chinese; their manners were comparatively rude and unpolished; the same strict order and police were not maintained; and beggars, who are never tolerated in the Chinese empire, swarmed on all the roads. They were so rational as not to have adopted the ridiculous and injurious system of cramping the female feet. On the whole, though the Tartar lords hold a high and even ruling place at the court of China, the nation in general is depressed under the ascendancy of the conquered state, all whose institutions have been adopted entire by the government.

4494. *The province of Mandshur Tartary*, immediately adjacent to China, is called Kirin-Oula, with a capital of the same name. The most remarkable place, however, is Zhehol or Gehol, the summer residence and hunting-seat of the Chinese emperors. The gardens here are most superb and extensive, occupying a large expanse of ground tastefully ornamented. The province, however, which is reported to contain the greatest extent of productive land is that of Shin Yang, or Leaotong, bordering on Corea. There are cities bearing each of these names, and of considerable extent. This district is even reported to carry on the manufacture of a species of ornamented paper, in request at Pekin. The northern region, watered by the Amoor, bears the title of Tzitzikar, or Mandshur Proper, being the original seat of that conquering race. Its towns, Tzitzikar, Ningouta, and Saghalien Oula, are poor, and of middling extent. On the Upper Amoor is the district of Solon, inhabited by a rude race of Tartars, who take their name from it; and farther to the east is Daouria, peopled by a mingled race of Mandshurs and Mongols.

4495. *The eastern coast of Tartary* does not, at any point, face the open expanse of the Pacific. It has, parallel to it, a chain of great islands, or rather a continuous extent of continent, penetrated at different points by narrow straits, and extending for about twenty degrees from north to south. The three greatest of these islands compose the empire of Japan, the importance of which claims a separate description, and which is divided from Asia by a broad expanse of sea. Japan has only a narrow strait between it and the island of Jesso or Matsmai, which, with the neighbouring one of Saghalien, suggested to the early navigators the idea of an immense extent of continent stretching indefinitely to the east and north. The observations of Pêrouse and Broughton have established it to be an island, extending about 150 miles in length, and 80 in breadth. All the level coasts adjacent to their own territory have been occupied and cultivated by the Japanese; but the rugged tracts in the centre and north are still held by the natives. A strait, as narrow as that which parts Jesso from Japan, interposes on the northern side, between it and the long and narrow island of Saghalien, which, for a space of about 700 miles, faces the eastern coast of Tartary. It has now, indeed, become almost more than doubtful whether it be an island or not. European navigators have traced on the south what is called the Channel of Tartary, and on the north the bay of De Castries; but they have left in the middle a space unexplored, where the natives report that Saghalien is joined to the continent by a sandy isthmus, so small that fishermen drag their boats across it. This isthmus, if it exists, is perhaps of recent origin, and is an alluvial deposit formed by the Amoor, which here terminates its course. Although the maps of the Chinese and Japanese represent Saghalien as entirely insular, yet the want of current, and the freshness of the water on the south side of the suspected isthmus, seem to give a greater weight to the contrary hypothesis.

4496. *The inhabitants of Saghalien*, and the natives of Jesso, consist of a peculiar race, called the Ainos, who possess a physical character entirely distinct from the inhabitants of the opposite coast of Tartary. Travellers, content with remarking this, have given very few particulars of their actual outward appearance, except that their persons are covered with a more ample growth of hair than those of any other race; a fact which, though Krusenstern has doubted it, seems to have a great predominance of testimony in its favour. Their occupations rank them among the rudest classes of human society. They are unacquainted either with agriculture or pasturage, and derive their sole subsistence from fishery or the chase. Yet Pêrouse remarked among them a degree of reflection and information superior to that which distinguishes the bulk of the people in a civilised country. He did not consider, that these precarious and adventurous employments, requiring invention and ingenuity to be always on the stretch, give much more scope to the intellectual faculties than the routine task of an European labourer. Their moral attributes he praises in still more unqualified terms; representing them as mild, peaceable, generous, and warmly attached to each other. The verdure is more brilliant than on the opposite coast of Tartary, and the sea abounds in an extraordinary degree with fish, among which whales in considerable numbers reach the coast of Jesso. They did not appear, however, to possess any materials for trade with nations at a distance so immense as those of Europe. Their only intercourse is with Japan, and with the country to a considerable height up the Amoor.

4497. *On the western limit of Mandshur Tartary* commence the almost boundless plains roamed over by the tribes of Mongolia, who extend for nearly fifty degrees of longitude as far as the Lake of Balkash or Palcati. In the central portion of Tartary, a principal feature is the Desert of Shamo, or Cobi, which extends almost entirely across it. According to the best of those imperfect accounts which we yet possess, it reaches about 2000 miles from south-west to north-east, separating like a great inland sea the countries upon which it borders. According to the report of Marco Polo, it is crossed, like the African deserts, by caravans with camels; and the real terrors of the journey are heightened by superstitious alarms, natural to those who find themselves bewildered in the depth of such an awful solitude. The traveller who chanced to straggle from the main body imagined that he heard a sound of march, sometimes like that of the caravan, sometimes like that of music and warlike instruments echoing through the air; when, following these delusive indications, he was led astray into some perilous, and, perhaps, fatal situation. The only precise account of it is given by the Russian embassies to China, particularly that of Lange, narrated by Bell. Though a month was spent in crossing it, the breadth does not appear to have exceeded 400 miles. The ground was covered with short and thin grass, which, owing, perhaps, to the saline quality of the soil, maintained a greater number of cattle than could have been supposed. There is, indeed, a considerable number of springs and lakes, but the water is so brackish as to be scarcely potable; so that a single pure spring which oc-

curred, tasted as delicious as burgundy or champagne. A space of twenty miles in extent immediately beyond the Chinese wall was composed of shifting and sinking sand, formed into waves twenty feet high, and the crossing of which was an operation of the greatest labour. The ground along this tract is covered with pebbles of considerable beauty, and even value.

4498. *All the habitable parts of this desert*, with the tracts to the north of the Thianchan, covered with rank and luxuriant pastures, are traversed by the *tribes or standards* of the Mongols. This terrible race are no longer in a condition to pour over Asia the tide of conquest and desolation. They are split into a number of petty tribes separate from each other, generally hostile, and incapable of combining for any common object. They have been made to own the sovereignty of China; but that state, unable either to maintain garrisons or exact tribute, leaves them much to themselves, and requires little more than that they shall leave it unmolested. Even this is not accomplished without the payment of a small salary or tribute to their chiefs. There is not even any effective prohibition against the practice of waging private war with each other; though, when this threatens to reach any serious or perilous height, a force is levied and sent out, by whose influence terms of accommodation are dictated. The physical features of the Mongols have been already described. In their character they are rough, roaming, warlike; but in domestic intercourse, frank, cheerful, and hospitable. Their main pride consists in the management of their horses, in which they appear indeed to show a wonderful degree of dexterity. They do not attempt to rival the weight and size of the Turkish horses, but prefer those which are swift, hardy, and serviceable. They have trained them to stop in their most rapid career, and to face, without fear, the fiercest animals. As the luxuries of horse-flesh and koumiss can be commanded only to a limited extent, they supply their place with cows, and with that species of sheep having huge tails composed entirely of fat, which prevails in many parts of Asia and Africa. For amusement, they hunt deer and a few sables; but find little opportunity for fishing. Amidst all the privations to which they are exposed, they manifest a gay and cheerful disposition, and take delight in various kinds of sports and exercises. Complete converts to the religion of Boodh, they have lamas, feigned or fancied to be immortal, and each of whose places is immediately supplied after death by another, believed to be a new body animated by the same soul. They have also gheims (gylongs), or monks, by whom the religious ceremonies are conducted; and these ceremonies are observed, as in Thibet, to bear a close resemblance to those celebrated under the superstitious forms of Christianity. This ecclesiastical nobility, however, though revered and handsomely supported, is far from enjoying the same exclusive dignity as in Thibet. The warlike chiefs hold that pre-eminence which is usual among such rude tribes.

4499. *The Calmucks* are by much the most numerous among the branches of the Mongols, and they occupy all the western portion of the region now described as Mongolian. In form, manners, and religion, they present scarcely any distinction. They appear, however, to have a more independent and regular form of government than any other Tartar nation. The khans of the different oorghs, or tribes, meet in a general council, to elect the great khan of the Calmucks. They boast of their country as that whence issued the Huns, who acted so celebrated a part in the overthrow of the Roman empire; and they even claim the great Zingis as their countryman. In the end of the seventeenth century, they had made themselves completely the ruling people, and masters of all central Tartary, including the southern countries of Cashgar and Khoten. Being attacked, however, by the Mongols, their rivals, confederated with the whole force of the Chinese empire, they were unable to sustain the unequal contest, which ended in the subjection to China of all Tartary east of the Beloor. The Mongols, though sharing the common subjection, became pre-eminent over their rivals, many of whom, unable to brook this double servitude, sought refuge in Asiatic Russia; but the mildness of the Chinese sway has since induced a large proportion to return. The whole number occupying their original seats is now supposed to amount to about 1,000,000.

4500. *Other branches of the same widely extended race* are the Kalkas, called sometimes the Black Mongols, whom Gerbillon describes as, next to the Hottentots, the dirtiest and ugliest race he ever saw; their neighbours on the south, the Eluths, dwelling round the great lake of Kokonor; and the Sifans, divided into Black and White, who occupy the head of the great rivers of China, on whose sands are found some grains of gold.

4501. *The region to the south of Thianchan, and of the Great Desert*, although of vast extent, and including some of the finest tracts of central Asia, has remained to the moderns almost utterly unknown. The narratives of Marco Polo and Goez, the only Europeans who are recorded to have passed through it, and the Tartar histories, afford only a few scattered notices, which can be combined into nothing like a regular survey. The appellation of Tangut appears to have been extensively, though in a somewhat vague way, applied to this region, which has also been called Little Bucharía and Eastern Turkestan. According to the report, however, of our late Persian travellers, the Chinese, having driven out the native princes, have incorporated the greater part of it into the kingdom of Cashgar. This kingdom, in its original limits, forms a wide plain to the east of the great chain of the Beloor. It is described as superior in beauty and fertility to any other part of Tartary, and as rivalling the finest tracts in southern Europe. It is watered by numerous streams, descending from the high border chain; the fields, carefully cultivated, are covered with large crops of grain, and the fruits are peculiarly excellent. It is a tract redeemed, as it were, from the general desolation of Tartary. At present, Cashgar appears to be flourishing under the Chinese sway. There, and in Yarkund, both Mahometan countries, the magistrates of that profession administer justice, and carry on all the internal

affairs, while the Chinese military officers called *amdans* collect the revenue, and defend the country against foreign invasion. The exclusion of strangers seems equally rigid at this frontier as at all the others. The boundary line is guarded by a chain of military posts, at which every package brought by the caravans is carefully examined; and permission is then given to go on to Cashgar and Yarkund, where duties of no very oppressive amount are exacted, but no foreigner must proceed farther.

4502. *Cashgar* is described as a handsome and ancient city, the seat of government, and, though not the chief emporium of this part of Asia, yet a place of considerable trade. A fine river from the west passes by it, and a lead mine in the neighbourhood affords employment to a considerable number of the inhabitants. Yarkund is universally allowed to be a larger and still handsomer city, estimated, by Mr. Burnes, to contain 50,000 inhabitants; of whom 5000 are Chinese, the rest Mahometans. Though destroyed by Abubeker, the grandson of Timur, it speedily regained its former prosperity. Its situation, indeed, seems to ensure its continuance as the centre of the inland trade of Asia, the grand medium of communication between the east and the west, the north and the south, of that great continent. Yarkund, accordingly, is a place of immense resort, and filled with numerous caravansaras for the reception of strangers. A handsome street runs the whole length of the city, entirely filled with shops and warehouses, which are kept by the Chinese, who sit on benches in front. There is also a considerable number of *madresses*, or colleges. The country around is described as almost unrivalled, particularly for its finely watered gardens and the excellence of its fruits. No strangers are allowed to pass Yarkund; on one being reported to have entered, the following instruction was received from court, "His head is the emperor's, his property yours."

4503. Ten other countries and cities are enumerated by Mr. Fraser and other writers as situated in Little Bucharía: Khoten, Aksou, Koutche, Eelah, Turfaun, Karachar, Elchi, Karria, Guama, Kargalie, Yengu, and Hissar. Khoten is celebrated in the early histories and travels as an independent kingdom of considerable extent and importance. Its territory, besides the ordinary products, is said to contain a species of marble and jasper, beautifully variegated with flowers, leaves, and other objects, which afford a material of profitable exchange with China. Its temperate climate and fruitful soil are marked by the production of the vine and the silkworm. At a period anterior to the Christian era, the doctrines and learning of Buddhism are said to have been introduced into Khoten, and to have flourished there till they were driven out by Mahometan conquest. At present, under Chinese sway, both religions are equally tolerated. Aksou is also described by Fraser as the capital of an extensive district subject to Cashgar. Humboldt represents it as the seat of an active commerce, and gives general caravan routes, which pass through it in different directions. Eelah was the Calmuck capital, when that people were the rulers of central Tartary; it is perhaps the *Cialis* of Goetz, and is still described as one of the largest cities in Tartary, containing 75,000 people. Turfaun is also mentioned by him as a large and strong city, the capital of a considerable country, governed by a branch of the royal family of Cashgar. No recent mention is made of Peym, or Poym, which, according to Marco Polo, ought to be within the above limits. Farther to the east, that traveller has described the country of Lop, in which was a great lake where the river of Cashgar found its termination. The city of Lop formed then a rendezvous of the caravans, that here found the most favourable opportunity of crossing the Great Desert on their way to China. Beyond it, and close on the Chinese frontier, is Khamil, called Hami in the Chinese maps, represented as a peculiarly fine country, inhabited by a learned and polished people, immersed, however, in dissolute and voluptuous habits. The Mahometan religion, which has been established through Cashgar and all its dependencies, gives place here to the ecclesiastical sway of the Lama. Peculiar superstitions, the remains, probably, of an earlier system, are said to prevail in this part of Tartary. The dead are often embalmed in spices, and kept for several years, till the astrologer has determined the planet under which they ought to be interred. There are lodged along with them in the tomb painted representations of men, women, cattle, money, and other objects, which it is imagined may be useful to them in the other world; a remnant, probably, of the custom prevalent among many savage tribes, who bury these objects themselves along with their chiefs.

4504. *Independent Tartary*, commencing at the great boundary chain of the Beloor, reaches westward to the Caspian, and is bounded on the south by Persia, and on the north by Asiatic Russia. Its chief divisions are the kingdoms of Bokhara and Kokaun, both famed and ancient seats of empire. They are situated upon the two great central rivers; one upon the Oxus or Amoo, the other on the Jaxartes, Sihon, or Sirr. Irrigated by these and some smaller streams, they are fertile and highly productive; but they form only, as it were, large oases in the great extent of southern Independent Tartary. That territory consists chiefly of a desert, composed partly of a floor of hard clay, partly of plains and hillocks of sand; in some places it is overgrown with brushwood, and covered with scanty herbage. The northern tracts compose plains of richer pasturage, occupied by wandering tribes of Karghises.

4505. *Bokhara* forms a fertile oasis, extending about 200 miles along the north of the Oxus, at about the middle of that north-westerly course by which it flows to join the Aral. The recent acquisition of Balkh gives to it a breadth of about 600 miles; but much of this is desert. The Oxus fertilises its banks only to the distance of a few miles; the chief culture and population is on the smaller stream of the Kohuk, or Zurufshaun, which falls into the salt lake of Dengis. This stream, diverted into numerous channels, communicates great fertility to the country: silkworms are copiously reared; even large crops of rice are raised. There is a jet black curly wool, much prized in Persia, to which about 200,000 skins, at three or four rupees apiece, are annually exported; also the goat, yielding the fine wool used in Cashmere shawls. Camels are chiefly employed in conveying merchandise. A considerable quantity of gold is found on the banks of the Oxus. That river is navigable for 650 miles to Koondooz, though the mouth is obstructed by marshes. The chief navigation is from Charjooee, in Bokhara, to Urgunge; higher up there are only ferries. The entire number of boats is not quite 200, of 20 tons each. The population is reckoned by the last Russian embassy at 2,500,000; by Mr. Burnes, at only 1,000,000: this last we should think too low. A great proportion consists of fixed inhabitants, cultivating the ground, or inhabiting towns. The bulk of these, over all Independent Tartary, as well as Cashgar and Cabul, consist of a race called Tadjiks, apparently descended from an original native people re-

duced to subjection by the conquering tribes who at present bear sway; and the name is now generally applied to all who have adopted the same peaceable and industrious habits. The regular military force consists of 20,000 cavalry and 4000 infantry; but it is supposed that 50,000 militia could be assembled. The troops are chiefly engaged in expeditions for the purpose of plunder, mostly over the vast plains of Khorassan. On these occasions, the party often ride for several hundred miles without intermission, till they have reached the city which is to be the object of attack. They study to arrive in the night, and watch the moment in the morning when the gates are opened and the inhabitants come out. The invaders then rush in, set fire to the place, kill all that resist, and carry the rest into slavery. Such proceedings, however, arise rather from the predatory habits of the Tartars, than from any peculiar impulse from the sovereign, in whose eyes, however, they are sanctioned by the consideration that the Persians are heretical Shias, and therefore, by the holy and orthodox Sunites, are justly devoted to bondage. The country in the seventeenth century was conquered by the Uzbeks, a Turkish people from the north. The reigning sovereign, a young man, only twenty-seven years of age, rules with justice and ability. A considerable inland trade is carried on with India, Persia, and, above all, with Russia. From Astrachan, two annual caravans come by way of Orenburg, each accompanied by 4000 or 5000 camels. In winter, the Oxus being frozen, they are enabled to pass it over the ice; but much hardship is experienced in consequence of the desolate character of the route, where often neither provisions nor water are to be found for several successive days. The imports from Russia are metals, arms, cutlery, cloths, and other European manufactures; the returns are in silk, cotton, hides, rubies, and turquoises. The kingdom, according to Mr. Burnes, is divided into eight provinces: — 1. Karakool; 2. Bokhara; 3. Kermina; 4. Meeankhal, or Kutta Koorgaun; 5. Samarcand; 6. Juzzauk; 7. Lubiab, or banks of the Oxus; 8. Balkh.

4506. According to Mr. Elphinstone, and the late Russian mission, the city of Bokhara contains 70,000 or 80,000 inhabitants; but Mr. Burnes estimates them at 150,000. As usual in Asiatic cities, the habitations of the ordinary citizens are poor; but there is a number of mosques, and *madresses*, or colleges, handsomely built of stone. Bokhara is a great seat of Mahometan learning, such as it is, and the government encourages it, the city containing 366 madresses, many attended by 70 or 80 students. To every madresse there is a lecturer; and these, with the students, are supported by funds consisting chiefly of the rent of lands or houses, appropriated to that purpose by Mahometan zeal and charity. There are 4000 Jews and 300 Indians.

4507. Farther up the Kohuk, and about 200 miles to the east of Bokhara, is *Samarcand*. Its walls still enclose a circuit of forty-eight miles: the beauty of its environs, and the delicacy of its fruits, are extolled in the same lofty terms which were used by the writers of the middle ages. This renowned capital of Asia is now little better than a mass of ruins. Here is also found the celebrated observatory of Ulugh Beg, and the mausoleum of Timur, paved with green stone adorned with jewels. It is watched by a few attendants, who were liberally supported by the court of Delhi; but, since the fall of the Mogul empire, they are left in a state of extreme poverty. Kurshee, with 10,000 inhabitants, is now a larger city. Charjooee, with 4000 or 5000 people, is the port on the Oxus.

4508. The tracts between the Oxus and the Jaxartes partake of the rudest character of Tartary, and are occupied only by bands of wandering Turkmans. The waters of the latter river, however, fertilise the kingdom of Kokaun and Ferganah, similar in cultivation and improvement to Bokhara. Omer Khan, a Mahometan prince, without making quite so high profession as the ruler of the latter state, cultivates peace, and is mild and beneficent in his internal administration. Kokaun, or Kokan, of modern origin, and recently made the capital, has risen from a small village to a city of 50,000 houses, with 300 mosques. It lies in a fruitful plain, watered by two small rivers. Khojund, the former capital, though decayed, is still more than half the size of Kokaun. Its situation on the Jaxartes is described as truly delightful, and its inhabitants as the most learned and polite of any in this part of Tartary. Taschkend is an ancient city, still very flourishing, and estimated in Humboldt's itinerary to contain 100,000 inhabitants, with 320 mosques. Murgilan is a large and fine city, at one time the capital of Ferganah. On the frontier towards the Kirghises is *Ush*, a populous town, the inhabitants of which have succeeded in reclaiming from roving habits a great proportion of that barbarous race, who are now peaceably settled round them.

4509. *Khiva* forms still another kingdom of Independent Tartary, once a seat of empire, and still considerable. It is situated on the lower Oxus, separated by a wide interval of desert from that of Bokhara. This country was the first in Tartary that was converted by the sword to the faith of Mahomet; which, about 710, the conquering Catifah preached in the mosque of Kharism. This last name became afterwards that of the kingdom, of which Urgunge was the capital, as well as of an empire extending over a considerable portion of Asia, but which was subverted by the arms of Zingis Khan. After being destroyed by Nadir Shah, it was rebuilt and made the capital of the present kingdom, the cultivated part of which extends less than 200 miles in length, and 50 in its utmost breadth, along the banks of the Oxus. The canals derived from that river are the chief means by which cultivation is produced. To Khiva, also, is loosely attached the roving population of those immense deserts which, on every side, insulate it from the civilised world; from Persia, from Candahar, and from Bokhara. Travellers across these wastes find only at wide intervals a few spots affording water and pasturage. That there exists, however, in their recesses a greater number of these oases than the routes across them would indicate, is proved beyond a doubt by the multitudes whom they pour forth for the purposes of war and plunder. The population of the whole territory has been reckoned at 300,000 families, of whom about a third are fixed; the rest wandering, pastoral, and predatory. These last roam usually through their deserts in a state of wild independence, under hereditary chiefs, yet are ever ready to join any standard, either of their own sovereign, or of Persian revolted chiefs, under which they may promise themselves adventure and booty. At present, as nothing on a great scale presents itself, they are principally employed in desolating Persia, and particularly Khorassan, by plundering expeditions, in which they not only

carry off every thing valuable, but the inhabitants themselves to perpetual captivity in the heart of their immense deserts.

4510. *The settled inhabitants of Khiva* are described as gross and uncivilised, when compared either with the Persians or with the Tartars. They indulge in gluttonous excesses, foreign in general to Oriental habits, and the persons of the chiefs are in consequence corpulent and overgrown. Their situation enables them to carry on some trade similar to that of Bokhara, though on a smaller scale. One branch they have extended much farther, that of slaves, if trade it can be called which consists merely in selling the unfortunate victims whom they have obtained by violence. Mr. Fraser heard it estimated that there were in slavery, throughout Khiva and Bokhara, from 150,000 to 200,000 Persians, and 15,000 Russians.

4511. *The city of Khiva* is situated about fifteen miles to the south of the Oxus, and contains about 5000 families. It is poorly built, and is, indeed, rather a fixed encampment than a regular town. Even the palace of the khan is only a large wooden tent plastered with clay. Urgunge, the ancient capital, is almost in ruins, though its situation on the Oxus still preserves to it a little trade. Hazarasp, a place distinguished in the revolutions of Asia, has experienced an equal decay.

4512. *Balkh, or Bulkh*, the ancient Bactria, possesses in Asia the fame of almost unrivalled antiquity, which seems to ascend even to the age of Semiramis. It is commonly called, in the East, the mother of cities. It retains, however, a mere shadow of its ancient grandeur. Only one corner of the wide circuit which its walls enclose is now inhabited, and is supposed to contain not more than 5000 or 6000 houses. The surrounding district is flat, fertile, and well cultivated, containing about 360 villages. This fertility is produced, in a great measure, by a grand reservoir formed of the numerous waters which descend from the southern side of the Paropamisian mountains; a single canal derived from which is said to yield a revenue of 9000*l.* sterling. As this source of fertility dries up, the country to the north declines into those sterile and naked plains which compose the greater part of Tartary. After being subject to Cabul, and then governed by Killich Ali Beg, an Uzbek chief, it now ranks as a province of Bokhara. It has been cruelly ravaged, however, by the chief of Koondooz, who carried off the greater part of the inhabitants, whose number is not supposed by Mr. Burnes now to exceed 2000. The ruins overspread a space of twenty miles in circuit, but consist only of Mahometan mosques and tombs; and nothing attests its having been ever the capital of a Greek kingdom.

4513. *Among the mountain districts of the Upper Oxus*, the pre-eminence is now held by Koondooz, whose chief has subjected all the neighbouring territories. It consists of a valley forty miles long, and thirty broad, bounded by the Oxus, and watered by two smaller tributary rivers. It is fertile, but unhealthy; excessively hot in summer, while in winter the snow lies for three months. The subject districts of Khoolloom, Heibuk, Goree, Inderab, and Talighan, enjoy an agreeable climate as well as a fertile soil, abounding in gardens and fruit-trees. Moorad Beg, the powerful ruler of Koondooz, has an army of 20,000 horse, with six pieces of artillery, but no infantry: his revenue is paid in grain.

4514. *Budukshaun*, situated higher up the Oxus, suffers under none of the inconveniences of these lower districts; and travellers speak with rapture of its rivulets and romantic glens, its fruits, flowers, and nightingales. The country is particularly celebrated for rare mineral products; among which are *lapis lazuli*, and very fine rubies. The last are found on low hills near the Oxus, and are worked at present for the benefit of Moorad Beg. That chief has cruelly ravaged Budukshaun, carrying off a great number of the inhabitants; the country also suffered from a violent earthquake in 1832. The capital is Fyzabad, on the Coacha, a mountain tributary of the Oxus.

4515. *Several still more lofty districts adjoin Budukshaun*, separating it from Tartary and India. On the north are Hissar, a well-watered country, productive in rice, lately conquered by the chief of Koondooz; Derwauz, ruled by an independent chief, and producing a considerable quantity of gold, on the banks of the Oxus; Koolab, Shughnan, and Wickhar, small districts ruled by Koondooz. Between Budukshaun and Yarkund is the very elevated plain of Pamere, extending for six miles in every direction round the lake of Zurikol, situated in its centre. It is entirely occupied by wandering and pastoral tribes of Kirghises. The space between Budukshaun and Cashmere contains the small mountain districts of Chitral, Gilgit, Iskardo or Eskerdon, bordering on Little Thibet, Gunjoob, where gold is found; and Kaushgur. The first is tributary to Koondooz, the rest independent. All these countries are inhabited by the Tadjiks, a native race of Tartary, who profess Mahometanism. Between Budukshaun and Peshawer, however, in a stony mountainous country, is a tribe of Kaffers or pagans, of peculiar appearance and complexion, who eat bears and monkeys, fight with arrows, and scalp their enemies. They are much addicted to wine, and devolve all the labour upon the women. A number of these mountain chiefs, particularly those of Derwauz and Budukshaun, claim a descent from Alexander, and receive royal honours in consequence. That of Eskerdon asserts a strong fortress, which forms his capital, to be of Greek construction. It is highly probable that the Greeks of Bactria overran these territories; and it is possible, also, that some of these chiefs may be sprung from branches of the royal family of Bactria. The idea entertained by some, that the Kaffers are an European race, seems quite unfounded.

4516. *Turcomania* is the name generally given to those immense deserts, which extend from Balkh to the Caspian and Aral, so far as they are not broken by the oases of Bokhara and Khiva. The surface, as already described, consists alternately of hard clay, moving sand, and scanty herbage. It is inhabited by wandering tribes, dwelling in movable tents, and almost constantly employed in those chupaos, or forays, accompanied with ruthless plunder of property and of human beings, of which the centre is at Khiva. With this view, they carefully maintain and improve their noble breed of horses, which sell in India for 1000 or 1200 rupees. The qualities, however, are various, as every one in this region is mounted; and even in markets, dealers buy and sell on horseback. The Turcomans boast that they neither rest under the shade of a tree nor obey a king; and, though they make a slight profession of Mahometanism, they have no mosques. Mr. Burnes estimates the number of families at 140,000, divided into the following tribes:—*Eastern*: the Salore (near Shurukhs), 2000; Saruk (Meru), 20,000; Ersaree (on the Upper Oxus), 40,000; Tuka (on the Tejend), 40,000; Sakar (on the Oxus), 2000: in all, 104,000. *Western*: Yamood (about Astrabad and Khiva), 20,000; Goklan (on the Goorgan), 9000; Ala (near Balkhan), 1000; Choudur (near Mangusluk), 6000: in all, 36,000.

4517. In order to complete the picture of *Tartary*, we must take a view of that northern region, bordering on Asiatic Russia, which is covered with the flocks and tents of the *Kirghises*. This remarkable race does not figure in the early revolutions of Asia. They appear then to have chiefly occupied the pastoral regions of Siberia, on the Upper Yenisei. When the Russians invaded these regions with a force which undisciplined warriors could not resist, the Kirghises, after a desperate struggle, yielded without submitting. They retired over the mountains into the wide uncultivated plains or steppes which extend to the north of the Jaxartes and the east of the Aral. They are divided into three branches or hordes, called the Great, the Middle, and the Little Horde. The Great Horde ranges to the east and south on the frontiers of Cashgar and Kokaun, and many of its tribes have adopted the habits of those more improved districts, and acquired a fixed and peaceable character. Only some of the high separating ranges contain about 50,000, who are called wild or mountain Kirghises, and entirely merit the name. The Middle and Lesser Horde occupy the shores of the Aral, and the tract extending from the Aral to the Caspian, and in these the original nomadic and pastoral character is preserved most entire. They own, in a certain sense, the sovereignty of Russia, which, however, must have recourse to measures both of conciliation and defence, to prevent them from making extensive depredations in its territory. In the former view, it grants pensions to the principal chiefs, of whom the khan receives annually 600 rubles and 20 camels; the rest in proportion; and it maintains a chain of strong posts along the whole line from the Ural mountains to the Irtysh. This does not preserve the frontier from occasional inroads; still less does it secure from plunder the great caravans which carry on by this route an intercourse with the central countries of Asia, and which can ensure their safety only by the humiliating expedient of a tribute, usually of ten or twelve rubles for each camel.

4518. *In their social and political capacity, the Kirghises* enjoy a greater share of independence than most of the other tribes of Middle Asia. The Little Horde, indeed, allows Russia to appoint a nominal khan; but he enjoys scarcely any power, unless what he can secure by wealth or personal qualities. The main authority rests with the little khans who are at the head of each clan, and the union of whom with the old men constitutes a sort of democratic assembly, by whom the great affairs of the nation are determined. Yet the slowness and indecision incident to such a body renders it less formidable in war than those which are commanded by warlike and absolute chiefs. The private life of the Kirghises is directed by the maxims of Mahometan law, of which they are strict but not learned observers. Under its sanction the chiefs observe polygamy to as great an extent as purchase or robbery can enable them, and a separate tent is allotted to each wife. The wealth of the Kirghises consists in horses, goats, the large-tailed sheep (which afford very delicate food), and a few camels. In these respects their possessions are said to be often very considerable. Their tents of felt are both larger and neater than those of the Calmucks, and one of them will often accommodate twenty persons. It has been chiefly, as yet, by plunder or contribution that they have obtained foreign luxuries; but some, adopting more peaceable habits, have begun to obtain them by the exchange of furs, hides, and felt.

CHAP. XI.

RUSSIA ON THE CASPIAN.

4519. *The Urals* form the western boundary of that main body of Asiatic Russia which is denominated Siberia. Between them, however, and the confines of Europe on the west, Persia and Turkey on the south, intervenes *a region of considerable extent* and remarkable character, over which sway is claimed, and in some rude manner exercised, by Russia. It consists of two portions, which, though considerably differing in aspect, circumstances oblige us here to combine.

SECT. I. *General Outline and Aspect.*

4520. *In this territory* the most prominent and connecting object is the *Caspian*. It is the largest inland sea in the world. Its greatest dimension reaches almost due north and south, and in this direction its extent appears to be upwards of 600 miles. It has an extreme breadth of 300; but this occurs only in the great bay or projection at its north-east extremity: every where else the breadth varies from 90 to 120 miles. This mighty inland expanse is supplied on the north by the Volga, which, after traversing, in a course of 2000 miles, the whole of European and part of Asiatic Russia, pours in the united waters of those vast regions. On the west it receives ample streams from the mighty peaks of Caucasus and Ararat. The Araxes, Kizil Ozen, and some others, reach a certain magnitude; but in general these rivers are too near their source to attain any great expansion, and they arrive chiefly in the form of mountain torrents, descending from the long range of snowy heights. On the south, also, the streams descending from the Elbourz, — the Kur, the Terek, and the Kuban, — are of moderate length, but copious and rapid. On the west, not far from the Persian frontier, one considerable tributary, the Ochus, Tedzen, or Kizil Daria, enters the Caspian; but by far the greater portion of this border consists of arid and dreary deserts, from which the Caspian Sea does not derive any accession to its magnitude. Considering the large sources which supply this great interior sea, many enquirers are at a loss to determine how they can be disposed of. Hence has arisen the theory of a subterraneous passage, by which its superfluous waters are conveyed either to the Black Sea or the Persian Gulf. As, however, the facts on which this theory rests seem derived from the most superficial observation, so the difficulty which gave rise to it appears more imaginary than real. Evaporation from a surface so immense may satisfactorily account for the waters received from all these rivers, of which only one is of the first magnitude. Its surface is supposed to have become lower within the last 200 years, and it certainly appears to be about 300 feet beneath that of the Black Sea.

4521. *The waters of the Caspian*, unless at the immediate influx of the great rivers, are as salt as those of the sea, with the admixture of a bitter taste, arising from a portion of Glauber salt, supposed to be produced by the decomposition of the naphtha which is found on its shores in considerable quantity. The navigation is very dangerous, particularly in the northern part, on account of the heavy and sudden gales which descend from the high cliffs of the western shore, and of the rocks and shallows with which this quarter abounds. There are no good harbours from Astrachan to Derbend. A cluster of considerable islands occurs in the Gulf of Balkan, on the eastern coast; and a number of small ones extend along the north shore, but none of much importance, considering the magnitude of the sea. An immense quantity of fish, particularly sturgeon, is taken in the northern part.

4522. *Of the shores of this great sea*, the southern belongs to Persia, the eastern to Independent Tartary and to the country of the Turcomans. The western and northern only are proper to the region we are now to delineate. Between the former and the Black Sea

extends a wide region entirely covered with those lofty chains to which the ancients applied the name of Caucasus. In height, in ruggedness, and in the variety of their aspects, though not unrivalled, they are surpassed by few in Asia, or in the whole world. This great range of high land may be stated, generally, at about 400 miles in extent from north to south, and 300 from east to west. Its greatest breadth and elevation appear to take place in the northern border of Georgia, where the Elbourz rears its gigantic summit. M. Kupfer, lately sent by the Russian government, on the suggestion of General Diebitsch, to measure its altitude, determined it to be about 16,500 English feet, which is considerably higher than Mont Blanc. He was only able to approach within 2000 feet of the summit. The boundary of perpetual snow is about 11,000 feet, which is considered higher than in any other chain, except the Himalayah. "This central chain of Caucasus," says M. Kupfer, "is entirely formed of porphyry. Imagine a plateau, 8000 or 10,000 feet high, extending from east to west, rent in every direction by deep and narrow valleys, and traversed lengthwise by a ridge of rugged and picturesque rocks, whose summits are covered with eternal snow; figure about the middle of this ridge an excavation very broad, but not deep, the centre of which is occupied by a cone which might be believed to be entirely formed of snow, did not the naked rock, which it covers, occasionally appear: this is Elbourz, whose height surpasses, by 3000 or 4000 feet, that of all the surrounding mountains. The Caucasian territory formed, for a century, the debateable ground between the empires of Russia and Persia; and the greater part of it, after having been an undisputed, though somewhat turbulent, appendage to the latter, has, unless in some rugged mountainous districts, yielded to the powerful arms of the European invader.

4523. *The tract of Asiatic Russia to the north of the Caspian*, enclosed between the Volga and the Ural mountains, is of a different character. The immediate shores, composed of the deltas of the rivers Volga and Ural, and forming the province of Astrachan, are flat and marshy. Farther north, the provinces of Oufa and Orenburg rise insensibly into a mountainous elevation, till they terminate in the declivity of that great chain which separates Europe from Asia. Here these regions participate in the rich metalliferous character which distinguishes Catharinenberg and the other districts on the Asiatic side.

SECT. II. *Natural Geography.*

SUBJECTS. 1. and 2. *Geology and Botany.*

4524. *The Geology and Botany of this region* have no features distinguishing it from those parts of Tartary and Siberia which lie under the same latitude.

SUBJECT. 3. *Zoology.*

4525. *The Zoological tribes*, which appear to have had their origin from the towering elevations of Caucasus, have been so frequently mentioned in the preceding pages, that little more need be said on their general nature. There is reason to believe, that around this lofty chain of Alps are concentrated most of those quadrupeds whose geographic range has been assigned to Europe; and representations of others, whom nature has given to western and southern Asia, and the confines of Africa. But the *Fauna* of these interesting regions is so deplorably defective, that much remains to be investigated before this theory can be received with confidence.

4526. *The Quadrupeds* mentioned by travellers as inhabiting the Caucasian regions are the Caracal Lynx, the Chamois and Ibex Goats, Bears, several Antelopes, and a species of small Tiger of an unknown race. The true Bison, so long extinct in Europe, is still sheltered in these wild recesses; and the Ovis Ammon, or wild Asiatic Sheep, extends from Central Asia to Caucasus. The Ibex of these mountains is distinct, however, from that of Europe, to which it appears superior both in strength and agility; there is also another species (*C. Ægagrus* Pallas) differing from both the former in its horns; and more closely resembling our domestic goat.

LONG-LEGGED PLOVER.

4527. *On the warm shores of the Caspian* is found that rare British bird, the *Charadrius himanlopus*, or the long-legged Plover (fig. 674.), together with most of the aquatic species known in Europe; nor can we point out a more interesting subject for philosophic enquiry, than the affinities which these countries appear to exhibit between the animals of Europe and of Asia.

SECT. III. *Historical Geography.*

4528. *The tribes inhabiting this tract* have always been regarded as dwelling on the outer border of the civilised world. They attracted, indeed, the notice of nations with whom they were in somewhat close vicinity; but their annals have never assumed a regular or connected

form. The Greeks viewed them only in dim and romantic distance, and considered the cliffs of the Caucasus, and the shores of the Mæotis, as the wild and extreme boundaries of nature. The poets painted Prometheus chained by the wrath of Jove to these awful rocks. The expedition undertaken to this quarter in search of the golden fleece was considered as exalting almost to the rank of demigods the daring mortals by whom it was achieved. Afterwards the southern borders of Iberia and Colchis became better known, and were even noted in the revolutions of Asia. Their rugged and inaccessible tracts served occasionally as the refuge of the vanquished, while they deterred even the boldest conquerors from an attempt to subdue them. It is believed that these recesses still enclose races whose habits and language bear the stamp of very high antiquity. Etymologists have even conceived themselves able to trace many of the radicals of that original language which, under varied forms, has spread from the East through Europe. It is much more probable, however, that the rugged seats of the Caucasus afforded shelter to these ancient races, than that they were the source whence population and language originated.

4529. *In modern times, Georgia*, the most powerful of the Caucasian kingdoms, has been distinguished by its contests for independence with the Persian empire, and, subsequently, as the main theatre of contest between that empire and the rising power of the czar. Russia, after a pretty long struggle, has secured the whole western shore of the Caspian, and all the level tracts between it and the Black Sea. Even the rude mountain tribes are obliged to own a certain homage; but this, as well as the accompanying tribute, is scanty, and fully compensated by the frequent plundering excursions, against which the Russians with difficulty guard by cordons of troops drawn along their border. Georgia, and still more Circassia, has been distinguished for the athletic strength of its men, and the fine forms of its females; in consequence of which qualities, they have been in great request as domestic slaves over all the Turkish empire. In Egypt, particularly, the offspring of those slaves, kept up by continual accessions, long maintained, under the appellation of Mamelukes, a sway superior or paramount to that of its Turkish masters.

4530. *Turkey possessed, till lately, some ports and districts* on the shores of the Black Sea, which enabled her to carry on a considerable traffic, especially in slaves, and also to foment insurrection among the rude mountain tribes. As, however, she has been obliged by the late treaty to cede to Russia the ports of Anapa and Poti, with the districts of Gurjel and Akhaltzisk, she may be considered as having entirely lost her hold of the Caucasian territory.

SECT. IV. *Political Geography.*

4531. It has already been observed, that *nearly the whole of this territory owns the sovereignty of Russia*. That power, to the extent of its means, seeks to establish around the Caspian the same despotic system by which its other territories are governed. Many circumstances, however, render this, in its full extent, impossible. Over a dominion extending amid inaccessible cliffs, buried in snows, or on boundless plains traversed by wandering shepherds, the most absolute ruler is obliged to slacken the rein. Provided the Caucasian tribes yield a certain form of submission, or even remain peaceable, they suffer little disturbance in their domestic economy, which proceeds upon principles very different from those which prevail among the servile nobles of Russia. The same proud aristocratic ideas, and the same value for the distinctions of birth, reign here which prevailed in Europe during the feudal ages. The lower ranks, who till the ground and perform all the menial offices, are nearly in the condition of serfs, or slaves, who, in many cases, may be, and are, sold for the profit of their masters. The fighting part of the population, again, consists chiefly of voluntary and attached vassals, the companions in peace, and the followers in war, of the head of their tribe. In the southern districts, especially, where the Russians must court the natives as their allies against Persia, they are obliged to allow them the unrestrained exercise of their national propensities. To the north, again, the vast plains on every side of Astrachan are continually traversed by Calmucks, Nogais, Kubans, and other Tartar tribes, who, though they may be brought to yield an enforced homage, could never brook a daily interference in their interior concerns. These are administered by their khans, who collect and transmit such scanty tribute as can be drawn from the flocks and herds of their humble vassals. Thus, in all the wide regions around the Caspian, Russia holds, indeed, full military occupation of the leading positions; but she is obliged to allow to all the natives, not indeed any solid or rational liberty, but that rude and proud independence which, in their eyes, is more precious. It is only in the northern provinces of Oufa and Orenburg, where cities with a civilised population, and extensive mining establishments, have been formed, that she has been able to mould the people to that uniform subjection which prevails in other parts both of her European and Asiatic territory.

SECT. V. *Productive Industry.*

4532. *The wealth and industry of this region* will not afford scope for very copious details. The Caucasian region presents to the scientific enquirer a varied and interesting vegetation, but a scanty portion of those products which are subservient to the uses of life. Even the lower valleys of Georgia and Mingrelia, though

endowed by nature with extreme fertility, are little improved. The inhabitants, ill disposed of themselves to industrious culture, are moreover liable to the almost continual ravage of war and predatory incursion. Their supply of arms and of foreign luxuries is chiefly derived either from plunder, or from the sale of their people as slaves. Wine in considerable abundance, though of middling quality; a little silk from the low southern districts; some skins and furs from the higher, and fine honey from the declivities of the hills, nearly complete the list of their commodities which are fit for the purposes of trade.

4533. Ever since Russia became at all civilised, *Astrachan*, at the head of the Caspian, has been of some importance as a *seat of commerce*. Two spirited attempts, indeed, were made by the English, one in the sixteenth century, and the other in the eighteenth, to establish a factory there, and open thence a communication with the interior of Asia. The leading object was a share in the commerce of India, which, in consequence of the occupation of all its ancient channels by the enemies of Christianity, had found out this circuitous and difficult line by the north of Persia, and across the Caspian to the Crimea. It was found, however, that Indian commodities could now be more cheaply conveyed by the new maritime channel of the Cape, and even by the Euphrates, to Aleppo. The secondary object, of exchanging the raw silk and precious stones of Persia for English cloth, was baffled by the cruel civil war which distracted and impoverished that kingdom. Even the great extent of land and river carriage across Russia, with the jealous caprice of a despotic government, would have presented insurmountable obstacles to the regular maintenance of such an intercourse. Astrachan, therefore, was in both cases abandoned, and has been left to carry on the little trade which can belong to the vast and desolate regions that stretch round it on every side. The Volga, indeed, after traversing all European Russia, and receiving many great tributaries, must bring down articles of some magnitude, — timber, flax, iron, copper; but these find not in the round of the Caspian either any adequate demand, or any means of obtaining copious returns. One of the chief sources of wealth consists in the immense quantity of fish which both the sea and its tributary rivers supply. The sturgeon is particularly excellent, and from it is manufactured the caviare, which is considered a delicacy over all Europe. To the north, the provinces of Oufa and Orenburg, as already observed, contain mines of considerable value, the management of which is intrusted to the general board at Catharinenberg, on the opposite side of the Urals.

SECT. VI. *Civil and Social State.*

4534. *As the countries of the Caucasus* have ever been little accessible to the rest of the world, the social existence of their inhabitants, modified neither by conquest nor foreign communication, presents many picturesque and varied aspects. Indeed, there is, perhaps, no part of the earth, in which rude and barbarous life appears under a greater variety of forms. As these are, however, in many respects dissimilar, and as society is split into a multitude of small tribes, the subject ramifies into a variety of details, which will be better given under the local division. In general, all these tribes profess the dogmas of the Mahometan faith, though in a somewhat loose manner, free from the tame and mechanical routine which that religion prescribes. Scarcely any of them possess among themselves, or have imbibed from the Russians, the smallest tincture of literature. They are almost universally addicted to habits of plunder, — that national plunder, on a great scale, which is considered rather a boast than a disgrace, and which is generally familiar to rude tribes who live in the vicinity of more opulent nations.

SECT. VII. *Local Geography.*

4535. In treating the details of this part of Asia, we shall begin with *the regions of Caucasus*, which present the grandest natural features, as well as the most peculiar and striking forms of society. The Kuban and the Terek are considered its northern boundary. Within this river-line the country presents a continuation of those vast pastoral steppes which compose southern Russia. In approaching them, however, the traveller descries the mighty precipices of Caucasus rising before him. Its highest ranges are clad in perpetual snow; beneath is the black region of rocks and precipices; while the lower declivities contain a number of well-watered valleys, forming fine pastoral districts; and, though not capable of high culture, yielding plentifully the inferior products, maize and millet. In these mountain valleys dwell the *Circassians*. This race have been peculiarly celebrated for their physical qualities. The men, though spare, are tall, handsome, and athletic. But it is the fine form and delicate complexion of the female Circassians which forms so wide a theme of Eastern panegyric. In these high valleys, with a northern exposure, they do not suffer that intense heat of the sun, which produces, generally, the dark tints of Asia. The daughters of all above the rank of slaves are exempted from oppressive or degrading labour, and merely occupy themselves in sewing, embroidery, and the plaiting of straw. Their beauty seems also to be the result of a careful study of all the circumstances which tend to produce or preserve female charms. The face is carefully shaded from the sun; they are fed moderately on milk and pastry; their feet are protected from injury by a species of wooden shoe; and their hands by the use of gloves. Some even make use of paint, but this is considered discreditable. The value set upon their virtue is marked by the barbarous precaution of a broad leathern girdle, fastened at an early age with silver clasps, and which the husband cuts through at marriage.

4536. *The distinctions of rank and birth* are observed in Circassia with all the strictness of highland pride. Under the prince, or sovereign, are the *uzdens*, or nobles, who attend him in war or foray, but exercise a sway almost absolute over their own immediate vassals. They are of two kinds, — bondsmen, who cultivate the glebe, and armed retainers, who attend him to the field; which last have often been raised, on this condition, from the inferior rank. The arrangements for marriage and education are of a most peculiar character, founded on a sort of Spartan apathy, which tramples upon every tender and domestic tie. Until after

the birth of the first child, the husband and wife live entirely separate, and never see each other, unless by stealth; the husband considers it an insult if the wife be even named in his presence. The child, when born, is never reared in the house, or under the eye of his parents. At the age of three or four, some friendly nobleman receives him, and undertakes the sole task of educating and rearing him. Under him the sons are trained in all manly exercises, and the females in those which belong to their sex, until the former is ready to take the field, and the latter to receive a husband, which this foster father is bound to provide. Then, and not till then, they are allowed to see their parents, to whom they have before remained strangers. This violent and fantastic mode of escaping the dangers of effeminate indulgence does not seem to be here inconsistent with that nurture for which full confidence is elsewhere reposed only on the parental care.

4537. *The noble Circassians* lead that sort of life which is usual with independent chiefs on their own estates, and surrounded by their vassals; a round of war and feasting, of hunting and jollity. Especial pride and care are manifested respecting their horses, whose parentage they consider almost equally important with their own. At the birth of the foal, a black mark, indicating its pedigree, is burnt upon the thigh, which cannot be effaced or altered under pain of death. As these noble animals are wanted both for ornament and use, they must unite the qualities of beauty, strength, and fleetness. On the armour, also, no cost is spared. The modern musket and pistol are combined with those of a former age; a coat of mail, often proof against pistol shot; a helmet of polished steel; a bow and quiver. As these, besides being of the finest materials, are, in the case of uzdens, ornamented with pearls and precious stones, their value amounts often to 2000 roubles. Besides the ordinary occupations of war and predatory excursion, these arms are employed in enforcing the right of private revenge, which, as in all barbarous societies, where no other mode of redress exists, is confided to the sword of the injured person, or that of his friends. With these habits of violence is combined, as usual, an almost romantic hospitality. When a stranger has been once admitted to draw a mouthful of milk from the breast of the mother of the family, he is under the protection of the house, and considered one of its members.

4538. *The only estimate of the population of Circassia*, which we have met with, is that of Pallas, who reckons the number of uzdens at 1500, and their fighting vassals at 10,000. This number would seem to be under the truth, unless it were restricted to the great Kabirdi, who form the principal tribe, and that which approaches nearest to civilisation. The serfs, or labouring part of the community, must, of course, exceed in number both the two classes mentioned above.

4539. *The Russian territories* every where border upon, and enclose, Circassia: yet the valour of its inhabitants, and the rapid movements of the light cavalry of which its bands are composed, have set at defiance every effort to reduce it to a state of regular subjection. The Russians, on the contrary, are only able, and that somewhat imperfectly, to protect their own confines from inroad by a chain of strong fortresses. These are chiefly erected along the Terek and Kuban, two considerable streams, which, rising among the loftiest heights of Caucasus, flow for about 400 miles, first north, then the former east, till it falls by numerous mouths into the Caspian, the latter west into the Black Sea. Mozdok, on the Terek, is the centre of this line of defence; a town of 3000 people, with a strong garrison. Georgiewsk, on the Kuban, is a fortress of smaller magnitude. Near the sources of the Terek is Uladi-Kaukas, "the ruler of Caucasus," situated amid the loftiest of its snowy pinnacles, and the fiercest tribes by whom they are tenanted. Though defended only by palisades and a wall of earth, it is sufficient to repel their unskilful assaults. It serves at once to bridle those fierce mountaineers, and to secure the route to Teflis, which, however, cannot be safely undertaken without an escort of upwards of a hundred Cossacks. Formerly a great part of this road lay along steep so rugged that there was not even room for a traveller to pass on foot between the river and the cliffs, and he was obliged to make his way by projections along their perpendicular sides, crossing, too, many imperfect bridges, that were often swept away by the rapidity of the stream. But the Russian government lately caused to be constructed, from the fort of Dariel to that of Uladi-Kaukas, a secure road, 51 versts long, with only two bridges; and, though rocks were to be blown up, hills levelled, ravines filled, and large dikes constructed, this great work was completed in five years.

4540. *The baths of Caucasus* are situated about thirty miles to the south of Georgiewsk, at the foot of one of the lower mountain ranges. They are very numerous, extending over a space of about twenty miles. They are of various qualities, sulphureous, chalybeate, and acidulous; and the principal one is described by M. Godet as so copious as to discharge about a million of pints in the twenty-four hours. They were scarcely known till the first journey of Pallas, but are now much frequented during the months of May and June, and commodious buildings have been erected, both by government and private individuals. In this vicinity is the Scots colony of *Karass*, which is in a flourishing state; though the missionary station established there has not answered expectation.

4541. *The lower course of the Terek*, through a fertile country, presents some interesting objects. Its commerce is chiefly carried on by Kislar or Kisliar, a town described by M. Godet, in 1828, as containing 2000 houses, and about 10,000 inhabitants, of whom 8000 are Armenians. This race, sober and industrious, founded the city in 1736, and carry on all its trade, by which they place themselves in easy and even opulent circumstances. The country round produces 40,000 hogsheads of wine, of 500 pints each; but it is of indifferent quality, and three fourths of it is made into brandy. Silk is also produced in large quantity.

4542. *On the opposite or southern declivity of the Caucasus* extends the famous and once powerful kingdom of *Georgia*. The world, perhaps, does not contain a region more profusely gifted both with richness and beauty. Numberless streams, flowing from the central and loftiest parts of the chain, irrigate and fertilise all its borders. On the sides of the mountains hang magnificent forests of beech, ash, chestnut, oak, and pine; and the ground is covered with vines growing wild in vast profusion. On its successive stages are raised all the varieties of fruit and grain, both of the temperate and tropical climates. The woods abound with game; and the mountains contain in their bosom mines of considerable

value. The human race flourishes in an equal degree: the men are distinguished for vigour; and the females, with the single exception of a darker complexion, are as famed for beauty as those of Circassia. All these bounties of nature, however, have been rendered unavailing by the oppressions of a feudal government, and by the continual wars which have desolated Georgia for more than a century. The nobles, who had reduced the prerogative of the king within very narrow limits, possess over their vassals the power of life and death, and extract from them the whole produce of their lands beyond what may afford the most scanty subsistence. The unfortunate husbandman is moreover exposed to the continual inroad of the Lesghians and other tribes from the upper heights of Caucasus, and is often obliged to plough with arms in his hands. Georgia, which had been protected by its situation from the tide of Turkish and Tartar invasion, was attacked two centuries ago by the whole strength of the Persian empire; and, after a very gallant struggle, was obliged to yield. The Sophis endeavoured to conciliate their new subjects, and Georgian youth were even employed as the royal guards of Persia. Yet the spirit of independence was not subdued; and when the power of their conquerors was shaken by the growing fortune of Russia, they eagerly sought to regain their freedom by an alliance with this new power. So far as related to the downfall of Persian influence, all their hopes were fulfilled; but the potentate through whom this triumph had been achieved, soon proved no less ambitious. The sons of the brave Heraclius were deprived of their inheritance, and Georgia was at last reduced to the regular form of a Russian province. This might have proved an ultimate good; and the Russians have in fact made some efforts to introduce tranquillity and industry; but the constant wars in which they have been engaged with Persia, and of which Georgia has been the theatre, have rendered these hitherto of very little avail. Through the pressure of these various evils, the population of this fine region is supposed to be reduced to a number not exceeding 320,000 souls. The greater number are not Mahometans, but Greek Christians, with a large proportion of Armenians, who have in their hands all the traffic of the country. The Russians draw from it a revenue of 800,000 rubles, not nearly sufficient to defray its expenses. The waters of Georgia are chiefly collected by the Kur or Cyrus, which flows first northward, along the foot of a chain of lofty mountains; but afterwards turns to the west and south, passes by Teflis, and falls into the Caspian on the borders of Ghilan. It has previously received the Araxes, from Ararat; the greater part of whose course, however, has been through Armenia and Aderbijan.

4543. The only city of Georgia of any importance, or worthy of the name, is *Teflis*, (*fig. 675.*), the capital. It is boldly situated on the precipitous banks of the Kur, which

675

CASTLE OF TEFLIS.

flows here through a deep and gloomy defile covered with immense forests. Several points in its vicinity command a grand view of the bordering chain of mountains, rising in successive stages above each other, and terminating in the snow-covered pinnacle of Elbourz. The city, founded in the eleventh century, does not possess any architectural beauty. It is a collection of low flat-roofed dwellings, built of dun brick, with small doors and paper windows. Nor are those splendid mosques, and gilded minarets, which elsewhere redeem the general poverty of Oriental

cities, to be found at Teflis. There are, however, several handsome churches, though chiefly distinguished for their picturesque situation; and the old citadel, placed on a high promontory, presents a grand and imposing mass of ruins. The only really good buildings are a few which have been erected by the Russians; the arsenal, the hospital, and particularly the great market-place, the shops of which are screened from the weather by a long range of columnar arcades; and which, as the natives begin reluctantly to acknowledge, is much more commodious than the old one. Teflis is famous for its baths, formed of warm streams descending from the neighbouring hills, and collected into two large apartments, one for the male and the other for the female inhabitants. Their medicinal virtue is said to be considerable; but to an European eye, they are dark, dirty, and incommensurable. The Russians make Teflis their head-quarters, and keep there a large military force, which is quartered upon the inhabitants. This is considered a serious grievance, being wholly inconsistent with the habits of Oriental seclusion, particularly in regard to the female sex, whose virtue, made hitherto to depend chiefly on the jealous guard kept over it, is said to have suffered materially from this intrusion. The population of Teflis, in consequence of the evils under which it has suffered, has declined in the course of the last twenty years from 22,000 to 15,000.

4544. Proceeding eastward from Georgia to the shores of the Black Sea, we find *Mingrelia* and *Imiretta*;

regions celebrated in antiquity under the name of Colchos. The interior tracts are mountainous and rugged; but Caucasus here slopes downward, and allows to intervene between it and the sea a large plain, moist, fertile, but unwholesome. Floods innumerable, descending from the heights, and uniting into thirty considerable rivers, inundate this watery region. Among these, the only one of great importance is the ancient Phasis, now called the Rioni, which, after a long course through the deep Circassian glens, enters the plain of Mingrelia, and forms its boundary on the side of Turkey, as it was anciently supposed to form that of Europe and Asia. The ground, impregnated with such copious moisture, becomes too soft for the plough, and unfit for the production of wheat or barley, but yields plentifully millet and other small grain, which forms the ordinary food of the inhabitants. Fruits of every kind grow spontaneously, though containing sometimes more juice than flavour; but this fault is not found in the figs, chestnuts, and grapes, which yield a strong agreeable wine. Raw silk abounds, and some rude manufactures are made of that material. There is a person holding the title of Prince of Mingrelia, and the country has vibrated between an attempt to maintain its independence, and a submission to Turkey or Russia; which last power has, by the course of events, become paramount. Mingrelia, however, has always been more exposed than even the rest of Caucasus, to oppression, tumult, and misrule of every description. The nobles are passionately devoted to hunting: they account a good horse, a good dog, and a good falcon, the first elements of human felicity. At the same time, they carry on the most regular system of oppression towards their dependants, and of indiscriminate plunder towards all others. Yet Mingrelia has not wholly lost that commerce which anciently rendered Colchos celebrated. Communicating by the Black Sea with Asia Minor and Constantinople, it supplies them with the commodities of the Caspian territory; silk, honey, and, unfortunately, above all, slaves; the obtaining of which, by purchase, seizure, and every sort of nefarious process, forms the principal occupation of the chiefs of Mingrelia. It is calculated that Turkey receives annually from thence about 12,000 of these unfortunate beings. As the port of Poti, however, at the mouth of the Rioni or Phasis, has by the last treaty been ceded to Russia, that power will henceforth command the trade of Mingrelia. Poti contains about 1000 inhabitants; from the obstructions at the mouth of the river, large vessels must anchor at the distance of half a mile. The late entrance of an English ship into this port forms a memorable event in the annals of commerce. Mingrelia extends about 140 miles along the sea-shore, and about forty or fifty inland. Reinegg estimates the population at 4,000,000; but, from every picture which has been drawn of it, we should imagine one fourth of that number exaggerated.

4545. *Imiretta*, composing the lofty interior of Mingrelia and the banks of the Upper Phasis, is a bold pastoral region, inhabited by a simple people, who have remained more exempt than the rest of Caucasus from the evils by which that region has been desolated. Their czar, an hereditary chief, continues to rule them, under a mere acknowledgment of vassalage to Russia. Retired in woody hills, or agreeable valleys, the inhabitants of Imiretta keep aloof from the scenes of contention by which they are surrounded. When, however, their native fastnesses are invaded, they defend them with all the hardihood of mountaineers. They have among themselves deep understood tones, which, echoed among the mountains, will often call up several hundreds from spots which did not seem tenanted by a human being. The people are accused of indolence; yet it is admitted, that silk, honey, and other Caucasian staples are reared by them with greater diligence than in other quarters. Cotatis, called its capital, is an old city on the left bank of the Phasis, now reduced to about eighty families.

4546. Bordering on Imiretta, south of the Phasis, is *Guriel*, a country naturally as rich as Mingrelia, but still more desolated by Turkish inroads, and now reduced almost to a desert, being estimated to contain not more than 6000 families. By the last treaty, however, it has been ceded to Russia, whence a material improvement in its condition is anticipated. Bathoumi, a port with the only good roadstead on this coast, is the seat of some trade.

4547. Proceeding northward along the Black Sea, after an almost impassable range inhabited by a wild race called the Sisanes, appears an extended and wooded region, *the country of the Abasses*, a rough variety of the Circassians. They resemble, without equalling, that people in their handsome persons and dignified manners. Secured from foreign invasion by the poverty of their country, and by its immense and entangled forests, they are wasted by intestine contests; and to the various forms of plunder, their situation has tempted them to annex that of piracy. It has also, however, enabled their country to become the theatre of some commerce in the usual Caspian commodities, that of slaves not excepted. Of this trade, Phanagoria, at the mouth of the Kuban, forms a sort of entrepôt. Anapa, farther to the south, a considerable port, with a good harbour, was in possession of the Turks till the last treaty, when it was transferred to Russia.

4548. All the nations now enumerated occupy the declivities or borders of Caucasus, where alone any extent of culture, wealth, or civilisation can exist. Yet its *extreme and most awful heights*, the regions of rocks and eternal snows, are not wholly without their tenants. Among these, the most known and formidable are the Ossetes and the Lesghis. The former occupy the mighty northern heights behind Circassia, and either hold or border upon all the routes leading thence to Georgia and the southern Caucasus. Of this position they avail themselves, either to plunder the passing traveller, or to levy a composition upon him. They block up the defiles, or roll down huge stones as he proceeds along the narrow paths cut in the perpendicular face of the cliffs. They have not a village that contains a hundred inhabitants, and their abodes are like little castles; yet, on an emergency, they can muster 10,000 horse. The Russians have beaten them, without being able to reduce them, but they have been forced to render up a number of their chiefs, who are kept as hostages at Mozdok, and by that pledge alone are prevented from indulging against Russia their favourite propensities.

4549. *The Lesghis*, who, from the southern summits of Caucasus, overlook the plains of Georgia, are a still more noted and terrible race. Viewing from this awful height the magnificent harvests which wave in the distance beneath, they are impelled to a perpetual career of robbery, and have become the terror and scourge of all the surrounding territories. Their habitations, perched on the summits of the loftiest cliffs, and on the edge of the steepest precipices, have a most fearful appearance. Respected as the bravest of all the tribes of Caucasus, and entrenched in its most rugged recesses, they have from time immemorial set all attempts to invade them at defiance. Like the Swiss, they have been tempted by poverty to engage in mercenary warfare, and hire themselves for a campaign of three months at the rate of twelve roubles. In their interior economy, they display no small degree of industry and energy. They have thrown strong bridges of stone or wood across unfathomable gulfs, have carried roads along precipices, and raised good water to their habitations by pipes or canals cut in the rock. They have availed themselves to the utmost of their scanty portion of ground, by forming it into terraces. They are chiefly Mahometans, with some remnants of Christianity; but a considerable number are still devoted to Pagan superstition, and worship the sun, moon, and stars.

4550. *Between the grand divisions now enumerated, there are various little tribes, and septs of greater ones, scattered through all the corners of this mountainous region.* Enough, however, has been already said; for the few scanty annals of the Kistes, the Jugouches, the Tusches, and the Karabulaks, would, we conceive, afford little edification to the reader.

4551. We have still to notice, at the head of the Caspian, *Astrachan* and its district, formerly constituting a government by itself, but now united to Caucasus, of which the city of Astrachan forms the capital. This place, seated amid such a vast range of mountains and deserts, has little opportunity of becoming great or opulent. Yet its water communications are very extensive, by the Volga on one side and the Caspian on the other; though these are inferior to those of Europe, and of the rich countries of the East. A river, however, which traverses all European Russia must bring down some commodities; and Astrachan obtains raw silk from Persia; turquoises from Khorassan; rubies and other gems from the head of the Oxus. After all, its chief wealth is derived from its own industry, particularly the vast fishery which it carries on. The quantity of fish obtained, is not only sufficient for domestic consumption, but is largely exported; and the roes of sturgeon,

prepared in that peculiar form called caviare, form an article of trade for which it is famed. A good deal of salt is obtained from marshy lakes in the neighbourhood; and some fabrics of leather and silk are carried on. The Russian monarchs, since the time of Peter, have made every effort to improve Astrachan and its trade. The Kremlin, however, and other monuments of its grandeur, when it was the capital of a separate kingdom, are now in ruins; and the city, though three miles in circumference, and surrounded by a wall, is for the most part poorly built of wood. Some handsome edifices of stone, however, have lately been erected, particularly two commercial halls. The population, amounting to 70,000, forms a various mixture of the people of Europe and Asia: Russians, Greeks, English, French, Persians; even the Hindoos have a small quarter appropriated to them. Most of the Persian trade is carried on by the Armenians.

4552. *The environs of Astrachan*, unless in its immediate vicinity, consist of a boundless extent of flat *steppe*, in many places almost desert, but in others capable of supporting a considerable pastoral population. The occupants are decidedly Tartar. A large body of fugitive *Calmucks* have filled the eastern part with their flocks and herds. The western tribes are chiefly *Nogais*, mixed to some extent with the Cossacks of the Don. The Tartar habits and character universally prevail, though the people are reduced by subjection to somewhat a more orderly and industrious way of life than they would spontaneously adopt.

4553. To the north of Astrachan is the large government of *Orenburg*, which forms, as it were, the link between European and Asiatic Russia. Tartars still form the basis of the population; but many of them have been trained to regular and industrious habits. The country is capable of every kind of culture, but is chiefly covered with rich pastures. Its western frontier is formed by the Ural mountains, possessing that rich mineral character which has been so often noticed. From these mountains flows to the Caspian a river called also the Ural, and which in its eastern course separates Russia from the vast wilds traversed by the Kirghises and Calmucks. A line of military posts here secures the empire from the inroad of these rude tribes. On this river is situated *Orenburg*, whose site has been several times changed, and which is now rather a well built town of 2000 houses. To this market the Tartars bring annually 10,000 horses, and from 40,000 to 60,000 sheep, the latter purchased chiefly for the sake of the tallow. Hence also numerous annual caravans depart for Khiva, Bokhara, Khojend, and other cities in the interior depths of Asia. Though Orenburg, however, be the most important city of the district, yet, in consideration of its exposed situation as a frontier place, the seat of government has lately been transferred to *Oufa*, situated at the junction of the river of the same name with the Belaia, which afterwards falls into the Kama. It is surrounded by a fertile territory, but lies itself in a species of hollow, intersected by numerous torrents and ravines. It is reported to have been once a great Tartar capital, and contains, in fact, many remains covered with Arabic and Cufic inscriptions.

CHAP. XII.

SIBERIA.

4554. Of the three great belts into which Asia is divided, and with which the geographic distribution of its animals has been observed to correspond, *Siberia* constitutes the third and most northerly. Its features are peculiar to itself, and, like those of the other portions of this continent, on a gigantic scale. As those of the south include the most extensive and populous empires in the world, and the middle tracts the widest range of pastoral table-land; so the northern regions of Asia present an almost unbounded expanse of frozen desert. Some of the plains, indeed, of its southern border are covered with deep and rich pasture, and, under a more careful tendance than they have yet received, might become the seat of populous kingdoms. But, as we proceed to its northern boundaries and the bleak shores of the ocean, human life, with the means of supporting it, becomes more and more deficient. Even here, however, that beneficent contrivance which presides over nature has provided for the support of a profusion of animals. That severity of the cold, which would otherwise be fatal, is guarded against in some by a thick coat of fat and unctuous substances; in others, by skins and furs, much richer, softer, and more beautiful, than those which clothe the tenants of the more favoured regions. The substances which communicate to these classes of animals the power of resisting the fiercest colds of the north, become, with little preparation, eminently useful and ornamental to man; the midnight gloom is enlivened, and the pomp of kings derives one of its most splendid decorations from commodities furnished by the shivering hunter of the polar desert.

Fig. 676.

SECT. I. *General Outline and Aspect.*

4555. *The outlines of Siberia* are formed by a continuous prolongation of some of the grandest features of nature. To the north, the ocean extends in a continuous line, not varying far from 70° of latitude, or somewhat beyond the Arctic Circle. On the east, also, Siberia is bounded by the ocean, not, however, the Arctic Ocean, but a corner of the great Pacific, enclosed between the opposite coasts of Asia and America, which approach each other till they form the narrow Strait of Behring. On this side the coast of Siberia is very much broken, and is bordered, not so much by the ocean itself, as by its deep gulfs of Okhotsk and Anadir. For its western boundary, Siberia has the long chain of the Urals, which reaches from the ocean almost to the Caspian, and separates the vast plains of Russia in Europe from those, equally vast, of her Asiatic dominions. This "stony girdle of the world," as the ignorance of Europe once termed it, presents not the formidable barrier which that ignorance has sometimes supposed. The height does not exceed 3000 or 4000 feet; and the slope on each side is so gradual, as to be ascended with little difficulty in ordinary vehicles. At its southern point, it is nearly, if not entirely, connected with that vast chain which, running from west to east under the general name of Altaï, forms a parallel line with the mightier ranges of central Asia and India, and separates Tartary from Siberia. It appears in most of its course to be considerably higher and more rugged than the Urals; the branches which it throws into Siberia are peculiarly rich in metallic ores. The range strictly bearing this appellation occupies only about 7° of longitude around the sources of the Irtysch and the Yeniseï, and is more remarkable for its richness in metallic ore than for its elevation; but it is connected with other liminary chains extending in the same direction; the Sayanskoi, reaching to the Baïkal; the Yablonoy or Apple mountains, an extensive and rugged range, which, uniting with the transverse one of the Khing-khanoola, is prolonged, under the title of the Slanovoy or Aldan mountains, to the Eastern Ocean. The application to the whole of the term Altaï is somewhat arbitrary; but M. Humboldt conceives that it may be advantageously called "system of the Altaï." It forms a continued line, bounding Siberia, and parallel to the Celestial Mountains, the Kuenlun, and Himalayah, those mighty chains of central Asia and India. After extending along the shore of the Eastern Pacific, it throws across the peninsula of Kamtschatka a ridge which shoots up to a much greater elevation than any of the rest; since M. Ermann has just determined Klintcheva, its highest peak, to be 18,805 French (above 20,000 English) feet above the sea. He found the whole of the ridge to bear the most decided marks of volcanic action.

4556. In delineating the land boundaries of Siberia, we have mentioned *its mountains*; for the whole interior of this region forms one vast dead and dreary level. The only great feature by which its wide expanse is diversified is its *rivers*; and these, in regard to length of course and volume of water, rival the greatest of the ancient world. They are not destined, however, like the streams of happier regions, to fertilise the plains through which they flow, and convey their rich produce to bordering kingdoms, and to climates beyond the ocean. No such purposes can be fulfilled by these

"solid floods,
That stretch, athwart the solitary vast,
Their icy horrors to the frozen main."

If any of them had flowed westward into Russia, and reached any of the seas of the civilised world, it might have borne rich cargoes on its bosom, and given an impulse to the industry of this rude region. But they all flow parallel to each other, from south to north, beginning in the Altaï and its connected chains, rolling their sluggish waves through frozen plains, and ending in a sea "bound in chains of perpetual ice," along which the utmost efforts of modern navigation have in vain attempted to find a passage. It is only by a broken line, ascending the tributary of one river and descending that of another, that a laborious boat track, interrupted by frequent land portage, is formed across Siberia to the Eastern Ocean.

4557. *In tracing this chain of great rivers*, beginning with the west, our notice is first drawn by the combined streams of the Irtysch and the Obi. The Irtysch, which seems to have some claim to be considered as the main stream, rises, to the south of the Altaï, from an elevated portion of that chain. After a considerable westerly course, it combines with some other waters in forming the lake Saizan, whence it again issues, and, crossing the mountain limit, rolls northward through rich pastoral plains, till it reaches Tobolsk. Here it meets the Tobol, which, with its tributaries, has collected the waters of the western tracts of Siberia. About 200 miles lower it meets the broad stream of the Obi. This chief of the waters of Siberia rises in or immediately behind the Altaï, and runs through the provinces of Kolyvan and Tomsk, by whose capitals it passes, till, swelled by numerous tributaries, it joins the Irtysch. Though rising from a source less distant, it pursues a more winding course, and rolls a larger body of water, so that its name prevails after its junction. The united stream,

however, rolls only through frozen plains, till, after a course of about 400 miles, it opens into a bay, or rather a broad estuary, called the Gulf of Obi.

4558. *The Yeniseï* flows east of the Obi, in the same direction, and nearly of equal magnitude. This second of the rivers of Siberia arises near the Lake Baïkal, on the southern side of the Sayanskoi chain, whose waters it receives for a considerable space, till it finds or makes an entrance into Siberia. It then flows nearly due north to the Frozen Ocean. On its banks are the considerable, though secondary, cities of Krasnoyarsk and Yeniseisk. A very little above the latter it receives an important tributary, the Angara, or Upper Tougouska, whose waters rush impetuously through a rocky passage out of the Baïkal lake. They become afterwards peculiarly clear and transparent, and pass by Irkoutsk, the second capital of Siberia, till they bring to the Yeniseï a stream of equal magnitude to itself. In its further course the Yeniseï receives two other Tougouskas, the lower of which has a course of 500 or 600 miles, and joins it at Turukshansk, on the borders of the Arctic Circle.

4559. *The Lena* remains still to be mentioned amid the mighty waters of Northern Asia, traversing its most remote and eastern regions. It rises from a small cluster of mountains on the northern shore of the Baïkal lake. Its early course, for nearly 1000 miles, is north-east, and sometimes almost due east; a direction highly advantageous for establishing a water communication with Okhotsk. While following this direction, it receives two considerable rivers, the Witim and the Olekma, both from the great boundary chain, called here the Yablonoy mountains. The Lena now passes Yakoutsk, the only place which, amidst the immensity of these eastern deserts, deserves the name of a town. A little farther down it receives the Aldane, which, with one of its tributaries, enables boats to reach within a short land carriage of the Eastern Sea. The Lena then flows almost due north, through desolate plains only frequented by the adventurous hunter, in search of the beautiful furs with which the animals that inhabit them are covered.

4560. *The secondary rivers of Siberia* are chiefly the tributaries of the great ones, and, as such, have been already mentioned. The Olenek to the west of the Lena, and the Indigirka to the east, would in Europe be considered great; but their obscure and distant course, in the vicinity of features so much more grand, scarcely attracts attention. The Kovima and the Anadir, in the extreme east, have obtained more notice, in consequence of researches to ascertain on that side the boundaries of the continent.

4561. *Siberia contains one great lake, the Baïkal*, whose dimensions almost entitle it to the appellation of an inland sea. The boundary chain, here throwing out branches peculiarly bold and lofty, forms a circuit of mountains, the waters of which not only suffice to feed this ample reservoir, but give rise to all the great rivers of north-eastern Asia. The Baïkal presents a grand and imposing aspect, being encircled by these mountains, which on the northern side are particularly rugged and rocky, and crowned with woods. The Russian navigators view it with peculiar reverence, calling it the Holy Sea, and reporting tales of those who have suffered severely in consequence of applying to it any less respectful appellation. This lake is about 300 miles in length by 50 in breadth. In winter it is completely frozen over, and down to the middle of March can be passed in waggons. Even in May, Mr. Bell found the navigation dangerous from the ice, and it was only by being moored to a solid mass of it that the vessel escaped injury. The lake abounds with fish, particularly sturgeon, and with seals, the presence of which seems very remarkable, considering the distance from the sea. The waters are said to be subject to certain interior agitations, which render the navigation sometimes dangerous, even when the wind is moderate. Its water is completely fresh. The other lakes of Siberia are excessively numerous, but scarcely deserve the name of lakes. They are rather chains of ponds, or stagnant collections of water, in the marshy or submerged steppes which cover a great extent of its western territories. Only the lake of Tchany in the steppe of Barabra, and of Kurg Algydum in that of Issim, present considerable expanses. A great proportion of these little lakes are saline, or variously impregnated with mineral substances. M. Humboldt thinks it not improbable that they are remnants of some great interior sea connected with the Aral and the Caspian.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

4562. *The Uralian and Altaian ranges* afford splendid displays of all the rocks of the primitive, transition, and alluvial classes; vast tracts, also, are composed of secondary and tertiary formations; and volcanic rocks of ancient and modern date rise through the older and newer deposits.

4563. *Mines.* — Siberia has been celebrated from an early period on account of its rich mines and precious stones.

1. *Gold mines.* The principal gold mines in Siberia are those of Berezof, in the district of Catherinenberg, on the east side of the Uralian mountains. The gold occurs either pure or disseminated through iron pyrites, forming what is called the pyritious ore of gold. Five English pounds' weight of gold are obtained from 1250 stone weight of the crude ore.

2. *Silver mines.* The most considerable silver mines are those of Kolyvan, Nerchinsk, and Schlangenberg. The silver occurs in a native state, more frequently in the state of ore, as silver glance, red silver ore, horn ore, or muriate of silver. Platina has been found in such quantity, to the east of the Urals, that it is now coined, the coins containing a certain proportion of silver.

3. *Copper mines.* Rich copper mines occur in the Uralian and also in the Altaïan chain. The prevailing ores in these mines are red copper ore, or red oxide of copper, and green and blue malachite.

4. *Iron mines.* Iron abounds in Siberia, but hitherto few considerable mines have been established in this division of the Russian empire.

5. *Lead mines.* Although galena abounds in Siberia, hitherto but few mines of lead have been opened.

4564. *Gems and Ornamental Stones.* — *Diamond*, the most precious of all the gems, has been lately found in Siberia, but not in considerable quantity. The most frequent of the gems are *topaz* and *beryl*: the true emerald has not been met with. The *Siberian aventurine* is a variety of quartz rock, with disseminated scales of mica, which, when polished, has a beautiful appearance. The red tourmaline, or *rubellite*, a very beautiful mineral, found at Sarapulka, not far from Mursinsk, when cut and polished, is highly esteemed as an ornamental stone or sub-gem. Beautiful *blue and green feldspars*, valued by collectors, are met with in different places; and the valuable and beautiful mineral, the *lazulite*, or lapis lazuli, which affords the well known pigment named ultramarine, is met with around the Lake Baïkal. The elegant *agates*, *carnelians*, and *calcedonies* of Siberia are well known; and the rock crystals, with embedded green tourmaline and rubellite, are prized by collectors.

SUBSECT. 2. Botany.

4565. *The botany of the Altaï mountains* has very lately been ably illustrated in the Travels of Professor Ledebour, of Dorpat, which we regret are not yet translated from German into the language of our country; but from which we learn, that the southern and western parts of the Altaï mountains, which it was the principal object of the author's journey to explore, consist of wide steppes, whose soil is partly sand and partly clay, containing more or less saline principle. There, nature, with few exceptions, only offers the general forms of the north of Europe, and those objects which are new and peculiar are neither remarkable for beauty nor singularity of structure. The Altaï range, on account of their north and easterly position, contrast but unfavourably with the mountains of more southern and tropical latitudes. The traveller does not, as in tropical climes, descend from lofty mountains into "smiling fertile vales," where a bright sky makes him forget all his fatigues: on the contrary, he must submit to be drenched with continually recurring rains, to experience frost even in the summer nights, and to wade through long and weary bogs. Deep and rapid are the rivers of this country, especially the Irtysch and the Alei: the Uba and the Ulba, the latter a tributary stream to the Irtysch, also take their rise in the mountains, and water, for a greater or less distance, the steppes of this district. There are many lakes, some strongly impregnated with salt, and few entirely free from it. Through the whole of the country which lies south of the Irtysch, the ground rises, partly into separate hills, and partly into ranges of small eminences, stretching one above another, like terraces, to a height of 1156 Parisian feet. Large pine forests skirt the Irtysch from Barnaoul to Schulbinsk; the banks of the Alei are also covered with trees, exclusive of the Fir tribes, and the same is probably the case with the other small rivers. The Uba and Ulba are, however, mostly destitute of wood; and in general, this wide steppe tract, except the above-mentioned pine forests, is barren of trees, though farther north, there is no deficiency of them. In the steppes occur many plants that grow plentifully in Europe, particularly the following: — *Adonis vernalis* and *Anemone patens*, both in great abundance; many species of *Artemisia*, *Allium*, *Gypsophila* and *Statice*; numerous *Umbellatæ*; *Ceratocarpus arenarius* and *Diotis ceratoides* cover whole tracts; and, where the ground is impregnated with saline principle, the peculiar salt plants occur in abundance, such as the species of *Polycnemon*, *Atriplex*, *Chenopodium*, *Frankenia*, *Tamarix*, *Salicornia*, and *Halocnemon*; also *Chorispora sibirica*, *Diotis atriplicoides*, and others. Farther south, *Amaryllis tatarica* is extremely plentiful, with *Rindera tetraspis*, and the equally rare *Nepeta sibirica*; and the beautiful *Eremurus* growing on the little hills. But the peculiar richness of the Flora of this steppe first displays itself near the Irtysch, where, besides most of the above-named plants, the following deserve to be particularly noted: a new species of *Peplis* and of *Camphorosma*; many individuals, quite peculiar to this country, belonging to the genera *Cachrys*, *Peucedanum*, and *Seseli*; among the *Asperifoliæ*, the genera *Echinosperrum* and *Lithosperrum*, *Cynoglossum viridiflorum*, *Solenanthus circinatus* (n. sp.), *Tournefortia Arguzia*, *Hyoscyamus pusillus*, *Rheum leucorhizum*; *Arenaria subulata*, *filifolia*, and *longifolia*; *Cotyledon Lievenii* (n. sp.), *Saponaria elegans* (n. sp.), many *Zygophylla*, *Ammodendron Sieversii*, *Calligonum Pallasii*, the *Saxaul*

(*Anabasis Ammodendron*, n. sp.), *Rosa berberifolia* (fig. 677.), *Ranunculus platyspermus*, *Dodartia orientalis*, *Dracocephalum integrifolium* (n. sp.), two new kinds of *Eremostachys* (a genus that ranks between *Phlomis* and *Molucella*), *Phlomis agraria*, several *Alyssa*, *Chorispora stricta*, *Goldbachia*, many *Lepidia*, *Megacarpaea laciniata*, *Stigma tomentosum*, *Tauscheria*; a host of *Astragali*, several of them frutescent; *Hedysarum splendens*, *Robinia Halodendron*, *Cirsium igniarium*, and a variety of *Saussureæ*, *Scorzonera*, and *Serratula*, with *Tragopogon ruber*, and numerous others. Many of these plants occur also even in the territory of Loktewsk. When rising to the mountains from these steppes, the vegetation, at a height of 4500 Parisian feet, assumes a still greater similarity to that of Europe; though many of the peculiar productions of the country still appear. The latter principally belong to the vernal plants; they also grow on the steep sides of the rocks, or adorn the banks of the mountain streams, wherever these are liable to occasional inundations. In such spots, *Gentiana acaulis* and *Cortusa Mathioli* flourish, and *Cardamine macrophylla*, *Saxifraga Geum*, *Pedicularis resupinata*, and others, grow in the greatest luxuriance. Also, rich flat meadows, situated at the foot of the higher mountains, produce many of the peculiar plants of Siberia; while, on the contrary, gently rising hills, or spots clothed with scattered wood, exhibit such vegetation only as is common to Europe. This is likewise observable in such places as form standing bogs, and are neither irrigated by the fresh water trickling down the mountains, nor shaded by a thick covering of foliage. Still the morasses of this region do possess some plants peculiar to themselves.

ROSA BERBERIFOLIA.

4566. *The Spring flora* is especially marked by the abundance of *Ranunculaceæ* and *Liliaceæ*; as *Ranunculus polyrhizos*; *Adonis vernalis*, *sibirica*, and *villosa*; *Pæonia hybrida*, *Anemone patens*, *cærulea*, *altaica*, and *umbrosa* (n. sp.), *Atragene alpina*, *Ornithogalum angulosum* (n. sp.) and *uniflorum*, *Tulipa altaica* and *tricolor*; *Iris ruthenica*, *glaucescens* (n. sp.), and *flavissima*. Among the rock plants of this region may particularly be noted the following, as most numerous: — *Veronica pinnata*, *Ziziphora media*; *Dracocephalum origanoides*, *peregrinum*, *pinnatum*, *Ruyschianum*, and *nutans*; *Nepeta lavandulacea*, *Thymus angustifolius*, *Patrinia sibirica*, *Androsace dasyphylla* (n. sp.), *Myosotis rupestris*, *Onosma simplicissima* and *Gmelini*, *Sibbaldia erecta* and *altaica*, *Statice speciosa*, *Swertia dichotoma*, *Thesium rupestre* (n. sp.), *Bupleurum baldense*, several *Allia*, *Stellera altaica*, *Gypsophila thesiifolia*, *Orostachys chlorantha*, *Sedum Eversii* and *hybridum*; *Silene altaica*, *graminifolia*, *stylosa* (n. sp.); *Potentilla pennsylvanica* and *sericea*, and many other individuals of this genus; *Thalictrum petaloideum*, *Linaria altaica*, several *Alyssa*, *Erysimum lanceolatum*, *Hesperis aprica*, various *Astragali*, *Oxytropis setosa*, *Aster alpinus*, *Centaurea sibirica*, *Prenanthes diversifolia* (n. sp.), and *Ephedra monostachya*. On the same plain grow, to the height of a man, some *Heraclea*, *Seseli athamantoides*, *Cirsium heterophyllum*, *Silybum cernuum*, *Achillea impatiens*, several *Adenophora*, *Delphinia*, and *Aconita*, many *Veratrum* and *Thalictra*, with *Senecillis glauca*, *Tragopogon orientalis*, *Pedicularis elata*, and the beautiful *P. proboscidea*, that covers large tracts.

4567. *Among the peculiar bog plants* of this region may be mentioned *Androsace filiformis*, *Viola (tricolori aff.)*, *Ranunculus Cymbalaria*, *longicaulis* (n. sp.), *natans* (n. sp.), *Gentiana barbata*, *Cirsium Gmelini*, *Potentilla multifida*, *Allium uliginosum* (n. sp.); and, where the ground is shaded by shrubs or low copsewood, we find *Primula sibirica*, *Phaca exaltata*, *Pedicularis speciosa*, and others; where the valleys expand, in consequence of the rivers that water them being swollen, as in the valley of Tscharysch and that of the Koksun; there, between the river and the mountain that bounds the vale, are extended, flat, steppe-like plains, similar to those found at the foot of the mountains, but with less luxuriance of vegetation, and different from them in their peculiar productions. In such spots grow *Convolvulus Ammanni*, *Gentiana Gebleri*, *Potentilla* (n. sp.) *subacauli aff.*, *Saussurea* (n. sp.); *Peucedanum vaginatum* (n. sp.), which, in dry places, is only a few inches high; *Aster altaicus*, *Veronica incana*, *Alyssum tenuifolium*, several *Artemisiæ*, with *Ranunculus amœnus* (n. sp.), *Sisymbrium micranthum* (n. sp.), *Ballota lanata*, several kinds of *Leontodon*, and, according as the soil is more or less salt, *Glaux maritima*, which frequently densely covers the ground, and the other formerly enumerated saline plants. From 4500 to an elevation of 6500 Parisian feet, where *Pinus Cembra* marks the highest present boundary of the growth of trees, the European species gradually diminish, to give place to the flora of the Altaï. Here grow most of the individuals of the genus *Pedicularis*, *Sanguisorba alpina* (n. sp.), *Primula nivalis*, *Veronica densiflora* (n. sp.); *Gentiana altaica*, *angulosa*, *glacialis*, *humilis*, and *septemfida*; *Swertia obtusa* (n. sp.), *Athamanta compacta* (n. sp.), *Linum sibiricum*, *Lonicera hispida*, *Primula Pallasii*, *Viola altaica*, *uniflora* and *pinnata*, *Juncus triglumis*, *Epilobium alpinum*, *Cerastium alpinum*, *Saxifraga Hirculus*, *Mespilus uniflora* (n. sp.), *Potentilla macrantha* (n. sp.), *Aquilegia*

glandulosa, *Ranunculus altaicus*, *Anemone narcissiflora*, *Dracocephalum altaicense*, *Linnaea borealis*, *Phlomis alpina*, *Cochlearia integrifolia*, *Macropodium nivale*, *Oxytropis altaica*, *sulphurea* (n. sp.), *Doronicum altaicum*, *Erigeron alpinus*, *Frolovia lyrata* (n. sp.), *Leuzea altaica*, *Saussurea pycnocephala* (n. sp.), a number of Willows, &c. The most central and westward of these extended steppes, which rise one above another like terraces, to an elevation of 5759 Parisian feet, is still more distinguished by its vegetation than the lower ones, situated on the banks of the Tscharysch and Koksun, being extremely arid, though sparingly producing, here and there, individual groupes of plants, and exhibiting such only as are entirely peculiar to itself. Two species of *Anabasis*, a new and shrub-like *Atriplex*, likewise an undescribed frutescent *Chenopodium*, and three new *Zygophylla*, two novel shrub-like and very strong-scented *Artemisiae*; *Corydalis stricta* in large bushes; some species of *Oxytropis*, with persistent prickly peduncles, some with verticillate leaflets, forming low shrubs: these, together with a few other plants, form the whole of the certainly poor, but highly interesting, flora of this steppe. Yet, at some hundred feet above the present boundary of the growth of trees are seen their dead stems, and on the ground many prostrate shrubs, such as *Juniperus nana* (?), *Betula nana*, several Willows, *Mespilus uniflora*, and *Dryas octopetala*. Many of the herbaceous plants of the preceding region occur also in this; but among those entirely confined to it are the following: — *Eriophorum Chamissonis* (n. sp.), *Athamanta crinita* (n. sp.), *Claytonia acutifolia*, *Gentiana algida*, *nutans*, and *rotata*, *Sibbaldia procumbens*, *Luzula spicata*, *Oxyria reniformis*, *Arenaria* (*Helmio aff.*), *nardifolia*, and another new species, *Biebersteinia odora*, *Cerastium pauciflorum* (?) *Lychnis uniflora* and *tristis* (n. sp.); *Saxifraga cernua*, *glandulosa* (n. sp.); *terekensis* (n. sp.); and *hieraciifolia*, *Sedum elongatum* (n. sp.) and *quadrifidum*, *Thermopsis alpina*, *Potentilla grandiflora* and *nivea*, *Papaver nudicaule*, *Ranunculus isopyroides*, *Thalictrum alpinum*, *Gymnandra bicolor* (n. sp.), several species of *Pedicularis*; *Draba carnosula* (n. sp.), *hydrophila* (n. sp.), and *lactea*; *Parrya exscapa* (n. sp.), *Corydalis pauciflora*, *Phaca frigida*, *Trifolium grandiflorum* (n. sp.), *Artemisia alpina*, *Cineraria* (*aurantiacæ aff.*), and *lyrata* (n. sp.), *Hieracium crocatum* (n. sp.), some kinds of *Leontodon*, *Pyrethrum pulchrum* (n. sp.), *Saussurea pygmæa*, *Orchis viridis*, and various Grasses and Sedges. Some plants also grow in this district that are found at every elevation throughout the country. *Caltha palustris* generally adorns the margin of little alpine rivulets; *Epilobium angustifolium* also is found in spots above the boundary of trees, quite unaltered in its appearance; *Erythronium Dens Canis* springs up wherever the snow is just melted.

4568. *The highest limit of trees*, estimated by Ledebour at 6500 Parisian feet, is, however, as he says, not always the same. It depends partly on the species of tree, partly on the declivity of the mountain. On the south side, at the rise of the Tscharysch, the last stem of *Pinus Cembra* appeared, at an elevation of 6541 feet above the sea. On the north side of the plateau of the Korgon, the highest limit of the same tree was 5254 feet; on the Koksunchen Snow Mountains (their east and west sides), at 5692 feet, on the snowy peaks of Ulbinski to the Kreuzberge, at Riddersk, where the Larch forms the boundary, these trees now cease at 5500 Parisian feet, while their dry stems may be seen at a height of 6187 feet. As to the grouping of the different kinds of trees, the following were remarked: Birch, Firs, and Pines are in the lowest situations; the Birch (*Betula alba*) rises no higher than 4536 feet on the Ridderschen Kreuzberge; on the east side of the Koksun Snow Mountains it ascends to an elevation of 5236 feet. Pines, which are seen on the sandy soil of the steppes, and are also common on the granite rocks among the mountains, seldom appear higher than 3000 Parisian feet above the sea. Firs, on the contrary, ascend to an elevation of 5270 Parisian feet, though from 4000 feet they are less frequent than on the steppe, where they form large forests. *Pinus sibirica* grows at the foot of the mountains with the Fir, but more frequently together with the Spruce (*P. Abies*); and at a height of 2000 to 2300 feet it is very abundant. From 4000 feet upwards, this species occurs more frequently as *P. Abies* disappears, and at 4000 to 5000 feet it forms large and close forests, but was never observed beyond 5270 feet, its limit being the same as that of the Fir. The Larch trees were not seen below 2550 feet; their highest boundary being on the Ritter Kreuzberge, 5500 feet: at 4000 feet they form extensive woods, every where covering the north side of the mountains, as on the Cholsun, Listwaga, and several others. *Pinus Cembra* first occurs at 4000 feet, but is never so numerous as to cover a tract of country, to the comparative exclusion of other trees. Ledebour heard of a forest of Cedars at Tschetschulicha, but never saw it, which was stated to attain a greater elevation than any other tree on the Altaï, even 6540 Parisian feet. When the woods are very thick, particularly of *Pinus sibirica* (but such were not observed north of Riddersk), they will scarcely allow a plant to grow; where they are not so close, and the ground is moist, they then shelter an uncommonly luxuriant vegetation: *Aconita*, *Cimicifuga foetida*, *Senecio sarra-cenicus*, *Cacalia hastata*, *Polemonium cœruleum*, *Orobis luteus*, *Pæonia hybrida*, *Arabis pendula*, and several others, frequently attain a considerable height, eight to ten feet, and even more; but where the woods are very thin, and the ground is dry, there the covering of plants is extremely scanty. It is difficult to fix the line of snow exactly. On the north

side of the mountain at Riddersk, the snow lies sometimes in the hollows at the height of 5500 feet during the whole summer, the quantity varying in different years. On the plateau of the Korgon, on the side inclining to the northward, Ledebour observed, at 6700 feet, large masses of snow, in which might be clearly distinguished the layers of several years; a circumstance rarely, if ever, seen on the south side of any mountain. For whether the summit of the Alp of Baschalathi is always covered with snow during summer, seems uncertain, though the natives declare such to be the fact. To what altitude the culture of corn may be successfully prosecuted, has not been ascertained by actual trial; yet it deserves notice, that corn grows, at about 4000 feet above the level of the sea, in villages to the south of Cholsun, which is also the limit of resident inhabitants. Some Calmucks, who rove in the lofty Tschuja steppe, may, perhaps, pass the winter at a greater height; still their *yourten* cannot be termed settled dwellings, nor is it possible that they do spend that season there. When the geographical position of these countries is carefully considered, lying from 47° to 54° north latitude, and at their northern boundary from 99° to 105° (but on the south from 91° to 102°) E. longitude from Ferro, no other prevailing forms of vegetation can really be expected, than such as bear a general similarity to those of the northern and midland parts of Europe; for it is well known, whatever be the longitude, that corresponding degrees of latitude produce the same kind of vegetation, becoming more and more alike as they proceed from the equator towards the poles. But we may reasonably conclude that many species, different from the European, occur in a country which is divided from Europe by a large chain of mountains, the Ural, running north and south, by immensely extended steppes, lying at the south and eastern foot of them, and which are even traversed by mountains whose elevated summits rise above the level of the snowy region.

4569. *A striking feature* of Altaïc vegetation consists in the scarcity of hard-wood trees. The Terebinthaceæ, Acereæ, and Tiliaceæ are absent, as also the genera *Quercus*, *Fagus*, *Carpinus*, *Fraxinus*, &c. The Birch is almost the only hard wood found in tolerable plenty; next to it are the Aspens, which present themselves here and there, collected into little groves. Besides these, two species of Poplar occur on the banks of rivers and in the low tracts. The other hard-wood trees do not attain a large size, and are scarcely numerous enough to deserve notice. With regard to the herbaceous plants, there is a considerable disproportion between the amount of annual and perennial ones. The former are very few, even in the less elevated districts; and as they diminish on the mountains of other countries, so they here disappear almost entirely. In a country where the vegetation is often, during the flowering season, covered with snow, the annual plants cannot be expected to survive long, as their seeds are seldom perfected; while the perennial plants suffer less, their roots being unhurt, and capable of throwing up new shoots.

4570. *There still belongs* another peculiarity to the Altaïc flora, which is, that in many of the families that are numerous there as to species, the genera are very few; while all the others seem to be replaced by an individual or a couple of genera: thus it is among the Personatæ, where the genus *Pedicularis* composes almost one third; and among the Asperifoliæ, where *Myosotis* and *Echinosperrum* number more than one half. In the Cynarocephalæ, too, upwards of half the species belong to *Saussurea* and *Serratula*; among the Eupatorinæ, the *Artemisiæ* are two thirds; and in the Rutaceæ, three fourths are claimed by the genus *Zygophyllum*. But the Leguminosæ present the most striking instance of this; for three fourths of the species in this very numerous family consist of the genera *Astragalus*, *Oxytropis*, and *Phaca*, while the many genera which are found in other places, contributing numerous individuals to swell that tribe, are, in the Altaï, almost wholly wanting: for instance, there are but two species of *Medicago*, and five of *Trifolium*. Twenty-three Ferns, according to the Linnæan system, of which one third belongs to *Equisetum*, were collected by Ledebour. There is little difference between the Cryptogamia of the Altaï and that of Europe.

4571. *Of the other parts of Siberia*, the vegetation is so similar to that of the northern districts of Europe, that we shall omit all notice of it, and direct the attention of our readers to a country which has been more satisfactorily explored by the botanists of the recent Russian expedition*; namely, KAMTSCHATKA, the ALEUTIAN ISLANDS, and BEHRING'S STRAITS.

4572. *The cove of Awatscha*, lying between the same degrees of latitude as Berlin and Hamburgh, and the haven of St. Peter and St. Paul in the interior, seem to be but little exposed to the influence of sea winds. The arborescent Birch grows here; but stunted, and very different from the slender, graceful tree that is so much admired in the north of Europe, and particularly at Petersburg. *Pinus Cembra*, which, on the European Alps, attains to a greater height than *P. Abies*, and forms the boundary of the trees, *Sorbus Aucuparia*, *Alnus incana*, and some Willows, are seen; but they remain quite shrubby. Timber may, however, be raised in the interior of the peninsula, where the climate is milder than on the east coast; and the seeds of the *Pinus Cembra*, which are eaten at the

* Particularly by Chamisso, from whose botanical writings many extracts are given in the first volume of *Hooker's Botanical Miscellany*.

tables of the Russians, come from Siberia, via Okhotsk. Grasses and herbaceous plants thrive luxuriantly, the soil being rich and the sky mild. There are but few species of vegetables, and these seem about equally distributed. In shady spots grow *Spiræa kamtschatica*, *Allium ursinum*, *Maianthemum canadense*, *Uvularia amplexifolia*, *Trillium obovatum*, &c. In the pastures are a *Veratrum*, *Lilium kamtschaticum*, *Iris sibirica*, &c. On the hills, which are rocky, abound some species of *Caprifolium*, *Spiræa*, *Rosa*, the *Atragene alpina*, and other mountain plants, as *Rhododendron kamtschaticum*, *Empetrum nigrum*, *Trientalis europæa*, *Linnæa borealis*, *Cornus suecica*, *Saxifragæ*, &c. Some kinds of Ferns, from the number of the individual plants, form a considerable part of the vegetation. *Urtica dioica*, which was probably introduced, seems to have established itself as a prevailing inhabitant of the soil.

4573. *The peninsula of Alashka, and the adjoining island called Unimak*, which is only separated from the continent by a narrow strait, seem to have the same character of vegetation as the main land, for trees are produced there; while Unalaschka and the other islands of the range are quite bare of them. A few miserable Firs, originally brought from Sitha, and planted at Unalaschka, may still be seen, most of them decayed, and the others scarcely living; but the plantation is young, and trees of this kind endure removal but ill.

4574. *The island of Unalaschka*, having been most explored, may serve as a point of comparison to illustrate the vegetation of adjacent and more northern countries.

4575. *At Unalaschka*, Willows scarcely grow higher than the grass and herbage of the moist grounds. On the inferior hills, a completely alpine vegetation appears; even on the

least elevated parts of the mountains are some *Vaccinia*, resembling *V. Myrtillus*, that scarcely rise above the ground. Besides the brilliant verdure, due to a moist atmosphere, which decks the grass in Kamtschatka, and enlivens even the summits of the rocks, the lustre of the fresh unsullied snow, and of some tufts of plants, bestow on those dreary regions a variety and beauty of hues which are quite delightful. *Lupinus nootkensis*, *Mimulus luteus* and *guttatus*, *Epilobium angustifolium* and *E. latifolium* (fig. 678), *Rhododendron kamtschaticum* (fig. 679.), &c. are among the most conspicuous.

4576. *The vegetation of Unalaschka* appears to have nothing further in common with that of St. Peter and St. Paul, than as respects its alpine flora and the coast plants of these northern shores. Besides such species as are likewise found farther north, there is only the *Li-*

lium kamtschaticum (except, indeed, the variety which grows at Unalaschka should prove a distinct species), and the *Uvularia amplexifolia*, common to both places; while, on the con-

trary, more Kamtschatkan species of plants prevail on the American coast, north of Behring's Straits, that are absent at Unalaschka. It is the flora of north-west America which descends to the base of the hills of Unalaschka, where it unites with the Arctic flora. Thus, *Rubus spectabilis*, *Lupinus nootkensis*, *Epilobium luteum*, and *Mimulus guttatus*, *Claytonia unalaschkensis* and *sibirica* may be reckoned also here. *Sanguisorba canadensis*, *Lithospermum angustifolium*, &c. belong to the common flora of America.

4577. *Many kinds of Grasses* grow in the low lands, with some *Umbelliferæ*, as *Angelica*, *Heracleum*, &c. A dozen *Carices*, scarcely forming a larger proportion of the vegetation than in the north of Germany, some *Scirpi* and *Eriophora*, accompany them, and a few *Junci*, in the proportion of about one to two. The *Orchideæ* constitute a groupe of some importance, both because of the number and beauty of the individual species: they prevail alike in the valleys and on the hills, to the number of 11 kinds; among them is a beautiful

Cypripedium. Higher north, not one of this family can be seen. Of the Ferns there are about 8; nearer to the Pole a single specimen of *Filix* only appears. At Unalaschka there are some *Lycopodia*; in the more arctic regions but one. Water plants grow in the lakes, as *Potamogeton*, *Sparganium*, *Ranunculus aquatilis*, &c.; in the higher latitudes only two species of *Hippuris*, and the common *Callitriche* can be found. Two other *Ranunculi*, *Prunella vulgaris*, a species of *Rhinanthus*, of *Cineraria*, *Achillæa*, *Plantago*, and *Geum*; some *Rubiaceæ*, a *Claytonia*, *Menyanthes trifoliata*, a *Triglochin*, &c., form part, also, of the productions of the valleys in Unalaschka, with a *Bartsia*, perhaps distinct from *B. pallida*. To a beautiful plant which constitutes a new and distinct genus, the appellation of *Romanzoffia unalaschkensis* has been given, in commemoration of the noble patron of science in Russia. The genera *Rumex*, *Polygonum*, *Aconitum*, *Thalictrum*, some *Alsineæ*,

678

EPILOBIUM LATIFOLIUM.

679

RHODODENDRON KAMTSCHATICUM.

the *Iris sibirica*, *Geranium pratense*, *Comarum palustre*, and *Montia fontana*, are distributed all over these arctic regions. *Empetrum nigrum*, and *Helleborus trifolius* *Linn.*, the latter being an American plant, not found more to the north, grow on most of the hills, indicating the alpine nature of the scenery. Also some *Vaccinia*, with the common *Oxycoccus*, *Arbutus alpina*, and *Uva-ursi*, with a white-flowered *Menziesia* (*M. cærulea* var.?) *Rhododendron kamtschaticum*, *Azalea procumbens*, *Andromeda lycopodioides* (which, nearer to the Pole, gives place to *A. tetragona*), the alpine Willows, *Silene acaulis*, *Sibbaldia procumbens*, *Cornus suecica*, *Trientalis europæa*, *Linnæa borealis*, *Ornithogalum striatum* (2 vars.?), *Anthericum calyculatum* *Linn.* var. *borealis*, *Königia islandica*, a *Gymnandra*, apparently different from that found farther north, 10 *Saxifrages*, 3 *Pediculars*, some *Potentillæ*, 2 *Gea*, 2 *Anemones*, 3 *Primulæ*, a *Papaver*, a *Drosera*, a *Pinguicula*, 2 *Pyrolæ*, a *Viola*, a *Parnassia*, a *Rubus*, and an *Arenaria*. There have been but one alpine *Ranunculus* and 3 *Gentianæ* seen; more individuals of these genera prevailing farther north. Of the class *Syngenesia*, *Aster*, *Hieracium*, *Gnaphalium*, *Leontodon*, and *Artemisia* grow at Unalaschka; this class abounding greatly towards the Pole, the genus *Artemisia*, in particular, exhibiting many individuals. On the other hand, Unalaschka produces some alpine species of *Campanula* and *Veronica*, which are entirely wanting in higher latitudes. Some individuals of the order *Cruciferae* are scattered, partly on the hills, and partly in the valleys. Neither *Alnus incana*, *Betula nana*, *Ledum palustre*, *Dryas octopetala*, *Diapensia lapponica*, *Rhodiola rosea*, nor the genera *Spiræa*, *Astragalus*, *Allium*, *Myosotis*, *Corydalis*, *Valeriana*, *Aretia*, *Androsace*, *Dodecatheon*, *Delphinium*, or *Orobanche*, all of which are natives of more arctic regions, grow at Unalaschka.

4578. *The maritime flora*, which is unaltered in the arctic regions, consists particularly of *Elymus mollis* (*Trinius*), *Arenaria peploides*, *Pisum maritimum*, with various appearances of *Pulmonaria maritima* *Willd.* (being, perhaps, a different species, the *P. parviflora* *Pursh*), *Cochlearia officinalis*, and *Arnica maritima*, which, though luxuriant and branched in Unalaschka, is, farther north, only one-flowered. To this list may be added *Potentilla anserina*. The sea, along the coast and in the creeks, is rich in *Algæ*; while the *Fucus esculentus* (the Sea Kale of the Russian inhabitants) is particularly observable among many gigantic species of this genus.

4579. *At Unalaschka, the Mosses and Lichens* begin to assume that predominant station which they hold in all the very cold districts.

4580. *A cursory view only has ever been taken* of the islands St. George and St. Paul, situated in nearly the same latitude as Riga. It is extraordinary how much more arctic is the appearance of nature there than at Unalaschka. No sheltered valleys, no protected spots, favour the vegetation of the plants of milder climes; a perfectly alpine growth prevails, both on the hills and the beach. The high summits of the desolate rocks are covered with pale and black Lichens, while those spots which are irrigated with melted snow afford only *Sphagnum*, a few other Mosses, and some Carices. There are no springs in the soil. The various arctic plants choose, according to their nature, the rocky or the moory spots; none rising above the ground, to which they seem as if closely appressed. A Lupine in the island of St. George, and an *Achillea* at St. Paul, remind the observer of the productions of Unalaschka; but there also are several species that are not seen even in the highest parts of the latter island, such as *Ranunculus Pallasii* and *Gmelini*, an *Androsace*, and a *Claytonia*. One plant only seems peculiar to these islands, a *Cochlearia* (?), which is plentiful and characteristic.

4581. *The alpine or arctic flora*, which at St. Lawrence adorns the foot of the mountains, does not seem to enliven their summits; for, when these are entirely free from snow, and the water produced by the melted snow irrigates some brilliant plants, the dry ridges and declivities of the masses of fallen rocks are only scantily attired with grey and black Lichens.

4582. *The mountains of these dreary climes*, being unprotected by any covering of vegetation, soon decompose. The frost bursts the rocks, every summer's gentle warmth causing fresh ruins, and so the destruction hastens towards its completion. Wherever the abundance of *Sphagnum* has not produced a boggy turf in the deeply watered places, the ground presents only heaps of broken rocks.

ANDROMEDA POLIFOLIA.

4583. *The aspect of nature at the cove of St. Lawrence* is most wintry; the scanty herbage barely covering the black soil, while the dwarfish Willows do not reach to one's knee. The *Andromeda polifolia* (*fig. 680.*), that is found there, does not exceed two or three inches in height, and is one-flowered. Among the plants of this cove are a *Delphinium*, a *Dodecatheon*, and an *Aretia*; also many undescribed species of those truly arctic genera, *Gentiana*, *Saxifraga*, *Astragalus*, *Artemisia*, *Draba*, *Ranunculus*, and *Claytonia*.

4584. *The island of St. Lawrence*, situated 2° more to the south, does not differ in vegetation from the cove of the same name. The *Andromeda tetragona* (fig. 681.), *Dryas octopetala*, *Diapensia lapponica*, and some alpine kinds of *Myosotis*, and a *Gymnandra*, clearly indicate the prevailing character of its productions. The naturalists who

681

ANDROMEDA TETRAGONA.

have visited this island remarked, however, that, on their arrival, they gathered more flowers there in the first few minutes, than during many weeks' investigation on the range of islands comprising Radack, &c., situated between the tropics. Here grow *Alnus incana*, in a very diminutive state, and *Spiræa chamædrifolia*, both of which are natives of Kamtschatka, but not of Unalaschka; and

which a severer atmosphere seems to have banished from St. Lawrence's cove. An *Orobanche* and a *Pinguicula* are among the plants of this island. *Cineraria palustris* vegetates with remarkable luxuriance in the well-watered slopes formed at the base of the mounds of ice; while *Betula nana* (fig. 682.) is seen even on the very shores. The plain country of this island is free from snow throughout the summer.

682

BETULA NANA.

SUBSECT. 3. Zoology.

4585. *Our knowledge of the Zoology of Siberia and of Asiatic Russia* is chiefly derived from the researches of the celebrated Pallas. The ungenial nature of the climate, the sandy and arid steppes and rocks by which these regions are every where intersected, and the total absence of umbrageous forests, at once accounts for the paucity of species appropriated to this immense territory. The assertion, therefore, made by Pennant, that Siberia is hardly less interesting than America, in the number and novelty of its animals, is singularly inaccurate: the proportion not being more, probably, than one to fifteen. There scarcely appears, in fact, either among the quadrupeds or birds of Siberia, one genus which is not common to the European zoological region: although the following list of quadrupeds will exhibit several species apparently confined to the eastward of the Ural mountains and the shores of Lake Baikal.

4586. *The Quadrupeds* more particularly belonging to Siberia are the following:—

Putorius sibiricus. Siberian Weasel.
Canis sibiricus. Siberian Dog.
Phoca leporinus. Hare Seal.
Otaria ursina. Sea Bear.
Otaria jubata. Sea Lion.
Arvicola arvalis. Field Mouse.
Arvicola œconomus. Economic Field Mouse.
Arvicola saxatilis. Rock Mouse.

Arvicola alliarius. Garlic Mouse.
Arvicola rutilans. Red Mouse.
Arvicola gregalis. Baikal Mouse.
Arvicola socialis. Social Mouse.
Arvicola Aspalax. Siberian Leming.
Phoca bothionica. Baikal Seal.
Phoca sibirica. Siberian Seal.
Georynchus talpinus. Mole-like Leming.

Georynchus torquatus. Ringed Leming.
Mus Caraco. Caraco Rat.
Mus agrarius. Sitnic Mouse.
Mus subtilis. Subtle Mouse.
Cricetus migratorius. Siberian Hamster.
Cricetus arenarius. Sand Hamster.
Cricetus Songarus. Songar Hamster.

4587. *In addition to the above*, travellers enumerate several others, common alike to the two Russias and the neighbouring regions, as the Rein-deer, Elk, Bear, Wolf, Fox, Marmot, Martin, &c.; but these have been already noticed as inhabitants of Europe.

4588. *The Economic Mouse*, as one of the most interesting animals, deserves a particular notice. These little creatures form burrows, with wonderful skill, in soft turfy ground. There are sometimes near thirty different entrances to the principal chamber; close to this are other caverns, used as granaries for their winter provisions. These stores they gather in summer, and in damp seasons will frequently bring them out to dry in the sun; they will not touch these hoards until the time of need, living in the interim on such other food as can be supplied from over-abundance. On the approach of winter, the male and female, who have hitherto been separate, mutually retire to their well-stored dwelling, and pass this rigorous season in ease and plenty, living upon the fruits of their former industry and forethought.

4589. *Of the aquatic Quadrupeds*, the *Phoca grœnlandica* (fig. 683.), and numerous other Seals, appear on the frozen shores of the North and White Seas, and different varieties on those of Lake Baikal. The northern *Stellerus* (*S. borealis* Cuv.), long confounded with the Manati of India, represents that unwieldy animal in the seas of Kamtschatka.

683

GREENLAND SEAL.

and proves it be distinct both from the Indian and the African species. The enormous tusks occasionally found, and said to weigh, sometimes, 600 lbs., have been inconsiderately assigned to the wild boar; but they no doubt belonged to this, or some fossil species of equally gigantic size.

4591. *Of the Birds*, our information is very defective. Pallas enumerates several, unknown to Europe; but they are small, and not generally interesting. The Great Bustard of Europe

4590. *An immense species of Elephant, now extinct*, appears to have formerly belonged to the frozen regions of Siberia; an entire specimen having emerged, not many years ago, from a mass of ice on the shores of the White Sea. Its skeleton is now in Russia.

684

SWALLOW-TAILED FRATICOLE.

is spread over the deserts, with the Swallow-tailed Pratincole (*fig. 684.*), a restless and clamorous bird, of rare occurrence in Europe. Partridges, Quails, and the smaller gallinaceous birds, are common; but the larger and more splendid Pheasants begin only to appear on the confines of central Asia and towards Persia.

4592. *The Domestic Animals* are much the same as those of European Russia.

SECT. III. *Historical Geography.*

4593. *The rude regions of Siberia* have but recently attracted the notice of the historian. No portion of it was included by the Greeks and Romans in their idea of the known or habitable world. The Scythians, the same pastoral tribe who occupy the regions of modern Tartary, were in their eyes the remotest people of Asia; the regions on the Jaxartes appeared to terminate Scythia.

4594. *The modern Tartar conquerors*, of whom Zingis, the greatest, had territories immediately bordering on this region, might have been expected both to explore and conquer Siberia. Although, however, traditions were found by Carpini, which showed a knowledge extending as far as Kamtschatka, it does not appear that much impression was ever made beyond the chain of mountains which separates these two regions of Asia. Formidable barriers of nature here arrested their efforts; and the current of their progress and conquest was always directed to the more tempting regions of the south.

4595. *It was reserved for Russia*, after she had shaken off the Tartar yoke, and become a great and powerful kingdom, to penetrate the secrets of this bleak and unknown region. Yet the first entry was from the province of Archangel, into its most dreary and unpromising quarter. The Samoyedes, inhabiting the Lower Obi, and the shores of the Frozen Ocean, were accustomed to come to the banks of the Dwina, to exchange their skins and furs for Dutch toys and other articles suited to their taste. Anika Strogonoff, an enterprising individual, conceived the idea of extending this trade by penetrating into the districts whence these valuable furs were brought. He obtained considerable wealth by this traffic, and at last persuaded several of the leading people among that simple race to repair to Moscow. The mere view of the pomp and luxury of the Russian court is said by the writers of that nation to have so strongly acted upon their minds, that they agreed to acknowledge the supremacy of the czar, and even to pay him a small tribute of furs. That prince soon availed himself of his newly acquired dominion to build on the Obi forts composed of logs cemented with earth, and to people this tract by making it a place of banishment for criminals, particularly those condemned or suspected of offences against the state. Siberian discovery assumed a more active character, in consequence of other remarkable events. Ivan Vassilevitch II., having driven the Tartars before him as far as the Caspian, found his power defied and his commercial views obstructed, by a band of daring nomadic warriors, who, under the name of Cossacks, have since been the bulwark of the empire. At that time, it required the exertion of all its force to root them out; and Yermak, their gallant chief, with about 6000 followers, refusing to submit, fled westward into southern Siberia. In seeking to obtain settlements there, he was opposed by the Tartar prince who reigned over that tract; but, having gained a complete victory over him, he found himself in his capital, Sibir, at the head of a more extensive kingdom than that which he had lost. Being still pressed, however, by the arms of the Russians, he could maintain his place only by acknowledging the supremacy of the czar, and reigning as his viceroy. Yermak having soon after fallen into an ambush laid by the Tartars, and lost his life, the dominion of Siberia reverted entire to the Muscovite prince. The facility with which it appeared that these extensive kingdoms might be traversed and conquered afforded encouragement to persevere. Orders were sent to the garrison at Narym to advance eastward. After a somewhat painful march through the dreary steppe of Baraba, they came to the fine pastoral regions watered by the Yeniseï. Here they found the Tungouses, a people new in form and aspect; and who, being gentle, and few in number, were easily induced to admit a light sway, and to pay a moderate tribute of furs. In descending the Angara, however, they came upon a tribe of different temper, the Burats, a branch of the fierce Mongol race, who showed no disposition tamely to resign their independence. The Russians paused in this direction; but found on their left along the Lena an almost unoccupied region, bleak and dreary indeed, but abounding in furs of the finest quality. The Cossacks pushed on, therefore, undeterred by the snow and ice, which, during most of the year, involved this wild extremity of Asia; and, in 1639, fifty years after the commencement of this career, one of their number, Dimitrei Kopilof, arrived at the shores of the Gulf of Okhotsk, a branch of the ocean boundary of Asia. Meantime, additional forces being brought forward at length compelled the submission of the hardy races on the Angara and round the Baïkal; every thing yielded till they came to the banks of the Amoor. Here they met the power of China, incorporated with that of its Tartar conquerors; and though, even in this combined state, that empire was much inferior to Russia in a warlike capacity, yet, being on its own ground, it could bring a greater force of somewhat disciplined troops. The issue of this contest was the repulse of the Russians within the line of the Amoor and behind that of the mountains, and the establishment of China in full

dominion over the desolate course of that great river. Neither of these powers have since attempted to pass those pastoral boundaries which form the distant frontier of each; and Russia has remained in peaceable possession of an empire which, if measured by superficial extent, would considerably surpass that of Alexander or the Cæsars.

4596. After this empire was acquired, however, *some grand problems respecting its boundaries* remained to be solved. The most important was, whether it communicated with the ocean on the east; which last involved also the question if Asia and America were or were not joined to each other. These questions had early appeared of deep interest to the great maritime nations of the west, chiefly because an open passage by the north of Asia promised a shorter route to India than that by the Cape. For this object a series of expeditions were undertaken by some of the first naval men of the age, both English and Dutch, who conducted them with characteristic boldness, not dismayed even by the tragical catastrophes which terminated the career of several. None, however, were ever able to pass the frozen barriers opposed by the coasts of Nova Zembla and of the Gulf of Obi immediately beyond. These attempts were relinquished in despair; yet the Dutch, when Peter the Great paid them his extraordinary visit as an apprentice in navigation, pressed upon him the importance of applying his superior means to the solution of these great problems. Peter sent instructions to Yakoutsck, to make every enquiry respecting the maritime boundaries of the Siberian territory, and particularly its relation with America. He never appears to have known what Müller claims the credit of having discovered during his visit to Yakoutsck, that there were buried in the archives of that place narratives of most important discoveries on these very points, which were then forgotten. From the year 1636, expeditions were sent down the easterly rivers Lena, Indigirka, Alaska, and Kolima, which ascertained the termination of these rivers, and the continuity of the ocean into which they fell. In 1646, a company of merchants undertook the first voyage eastward from the Kolima, and actually reached the territory of the Tchutchi, the rude tenants of the north-eastern peninsula of Asia. This was followed, in 1648, by a more important expedition, undertaken by two Cossack chiefs, Deschnew and Ankudinow. The latter was wrecked near the isthmus at the mouth of the peninsula; but Deschnew, after various adventures, suffered shipwreck, at the end of the year, on the river Olutera, south of the Anadir. This would imply that he had rounded the north-eastern points of Asia, and ascertained the disjunction of the two continents; and this appears the most probable supposition: though the great imperfection of his journal still left room to assert, that he had passed from one ocean to the other, merely by crossing the isthmus of the Tchutchi peninsula.

4597. *At the very close of the seventeenth century*, the sphere of Russian knowledge and dominion was extended to the peninsula of Kamtschatka, neither a fine nor valuable territory, but presenting, both as to the country and inhabitants, an entirely different aspect from the rest of the empire. Here, launched on the Eastern Ocean, the Russians found themselves, as it were, in a new world; they saw the long chain of the Kuriles, terminating in the large islands of Saghalien and Jesso, and, beyond these, the great and fine islands which compose the empire of Japan. Their discoveries were now linked with those of the great maritime nations of Western Europe, and had thrown a pretty full light on the whole of the extreme east of Asia. No less important was the era when it was ascertained that some large islands, reported to exist in the ocean to the east, were fragments of the corresponding coast of America, and that this coast approached closely, if it did not actually join, the new shores occupied by Russia.

4598. *The report of these interesting discoveries* reached Petersburg when the throne of Peter the Great was occupied by his relict, Catherine I.; a princess who at once revered his memory and inherited a portion of his spirit. She entered with zeal into the projects of discovery, and formed a regular plan for completing it. Several connected expeditions, proceeding at once from the northern and eastern coasts, were appointed to explore thoroughly the remotest limits of her vast eastern dominion. In 1726, Captains Spangberg, Behring, and Tchirikow set out from Petersburg on this destination, and were afterwards joined by the eminent mathematician Delisle de la Croyère. These expeditions did not answer all the expectations formed of them; but in 1728, Behring discovered the Straits which bear his name, and was there informed that, after passing beyond a cape about 200 miles distant, the direction of the coast became entirely westward. He reached this cape, where, seeing the coast, as far as the eye could reach, actually run in that direction, he conceived that he had passed the extreme point of Asia, and inferred the entire disjunction of that continent from America; a just conclusion, on hasty premises; for this coast takes another circuit to form the peninsula of the Tchutchi, before its final western direction. Behring and Tchirikow, also, in 1741, sailed across, and made considerable discoveries in the hitherto almost unknown coast of north-western America.

4599. After this time the spirit of discovery on the part of Russia seems to have slumbered, and the next great light thrown upon these regions was by Cook, the immortal British navigator. After exploring a great part of the north coast of America, he sailed through Behring's Straits, and along a considerable portion of the opposite coasts of the two continents; when

their respective lines were found decidedly receding from each other, one to the east and the other to the west. The separation of the continents appeared then to be ascertained; yet it has been surmised, that, as the northern coast of Siberia cannot be considered as thoroughly examined, they may approximate, and, by a long circuit, unite with each other. This supposition, against which there are many presumptions, is said to be now completely negated by the successful voyage of Baron Wrangel along that part of the northern coast of Siberia from which alone it was possible that such a junction could have taken place.

SECT. IV. *Political Geography.*

4600. *European and Asiatic Russia* are subject alike to the same simple government, that of a pure despotism, in which the absolute power of the sovereign is liable to no check whatever, either on the part of the nobles or the people. Siberia is in this respect even less fortunate than Russia, since the sway exercised over it does not rest on custom or opinion, but is enforced by the constant presence of a foreign military force. In Asia, as in Europe, however, this sway is mild, and tempered even with an active regard to the introduction of knowledge and civilisation, into regions which were before destitute of all these blessings. Yet Siberia shares more distantly the beneficent and enlightened spirit which has actuated the Russian cabinet. Officers so far removed from the seat of government have greater opportunity and temptation to abuse their power; and the native tribes have retained, almost unaltered, all the rude habits of their former life. Still, they have been checked in that career of intestine war in which they were otherwise likely to be almost perpetually involved; and whatever exists in this vast region of the habits and comforts of civilised life has been introduced by the colonisation and conquests of Russia.

4601. *Siberia for a long period formed one single government*, of which the seat was at *Tobolsk*; but of late it has been divided into two governments, *Western* and *Eastern Siberia*. Of the former alone *Tobolsk* is now the capital; the latter has its seat at *Irkoutsk*. *Western Siberia* includes the provincial governments of *Tobolsk Proper*, *Omsk*, *Tomsk*, and *Kolyvan*; the *Eastern* includes those of *Irkoutsk Proper*, *Krasnoyarsk*, *Nertschinsk*, *Yakoutsk*, and *Okhotsk*. Although the intentions of the general government are good, it is inevitable that, in the distant establishments, opportunity must be given both for embezzlement and oppression. "God is high, and the emperor far off," is said to be a maxim extensively acted on. In the naval department of *Okhotsk*, such laxity prevailed, that it was customary for an officer, whenever he wanted money, to step into the dockyard, take out articles to the requisite amount, and sell them for his own advantage. Much, however, has lately been done to remedy these abuses; and the administration at the central seats of government is said to be at present very good.

4602. *The Cossacks*, the military force by which Siberia is held in subjection, compose also the bulk of the Russian inhabitants. In the government of *Tobolsk*, *Giorgi* supposes them to amount to 22,000. Two regiments are stationed at *Tobolsk*, the same number at *Tomsk*, at *Irkoutsk*, and in the government of *Krasnoyarsk*. A large proportion, however, are employed to garrison the chain of *ostrogs*, or wooden forts, formed along the *Irtysch* and the line of the *Kirghises*, to protect the frontier against the inroads of that lawless and daring people. A smaller number is necessary along the Chinese frontier, comparatively well-ordered and pacific, and likewise among the thinly scattered and quiet occupants of the northern plains and rivers. In *Kamtschatka*, however, a considerable force is maintained.

SECT. V. *Productive Industry.*

4603. *Agricultural industry* affords less wealth to Siberia than to any other region of equal extent. The greater proportion of it must indeed be confessed to have been unfitted by nature for this important pursuit. Throughout all the northern tracts, the earth is bound in perpetual frost. *Yakoutsk*, the most northerly town of any magnitude, possesses a rich soil, and the inhabitants attempt to raise a little rye; but in a climate where, at the beginning of June, the earth is still deeply frozen, the ripening even of this crop is ever a matter of complete uncertainty. The liminary mountains, also, which form the land-boundaries of Siberia, bear nothing but pines and other hardy trees of a northern region. Even that broad level belt which, in the south, extends under a tolerably mild climate, consists in a great measure of those marshy and saline steppes which yield only rank and unwholesome vegetation. Various tracts, indeed, along the upper part of the *Irtysch* as well as along the *Tobol*, the *Izet*, and others of its tributaries, are covered with luxuriant pastures, and might yield very rich crops. Culture, however, is limited, not only by the indolence of the inhabitants and the want of a distant market, but by the almost exclusive taste of the Tartar inhabitants for pasturage, and particularly the rearing of horses. Even under the last head, *Pallas* complains that, in their eagerness to procure mares' milk for the purpose of converting it into *koumiss*, they rob the foals of their due, and also that they do not make sufficient provision for their winter subsistence; yet he cannot deny that they contrive to rear a very fine breed. Even of grain, amid all their neglect, the produce is so plentiful, that its

cheapness, as well as that of animal food in the great cities of Siberia, is almost incredible. Pallas, at Tomsk, found oatmeal selling from a halfpenny to three farthings per peck; an ox at five shillings; while an excellent horse was considered dear at ten shillings. Gmelin asserts, that at Tobolsk a man may live comfortably on an annual income of a guinea and a half. The very finest district of Siberia appears to be that along the Upper Yeniseï and the Angara, from Krasnoyarsk to Irkoutsk. Immense crops, not of wheat, indeed, but of oats, barley, and rye, are produced without the aid of manure, which, in a soil so luxuriant, is said to be even injurious.

4604. *Manufactures* can scarcely be said to exist in Siberia; we therefore pass to *mines*, which form a most extensive part of her exchangeable wealth, and in which she may rank with the richest countries in the world. No sooner has the traveller passed the Urals, than he finds himself in a sort of mineral empire, and sees metals of almost every kind extracted almost in every possible manner from the bowels of the earth. Gold, indeed, may be said rather to have given splendour and celebrity to the mines of Catherinenberg, than to have yielded any considerable profit. In the course of thirty-four years their entire produce did not exceed 1,200,000 rubles. The metal is found in quartz diffused through a ferruginous pyrites. Of late, however, it appears that sands impregnated with gold have been discovered, from which it has been drawn in much larger quantity. A late traveller conceives that these auriferous sands are diffused over a space of 1000 miles along this chain. The produce in 1828 was 318 poods (about 53 tons), which Humboldt values at 727,000*l*. The rare metal of platina is also drawn in considerable quantity from the Urals. They are not so rich in silver as some of the mountains of the interior, but the supply of copper and iron is truly immense. In the year 1782, the quantity of copper drawn from both sides of the chain, but chiefly the Siberian, was 190,000 poods (about 31,500 tons); of iron nearly 400,000 poods, or 66,000 tons. Almost all these mines are worked on behalf of the government, with slaves, who consist chiefly of banished convicts. The yearly wages of these unfortunate persons are limited to 13*s*. 6*d*., with a suit of clothes; and for subsistence their daily allowance is only two pounds of bad bread. The superintendents fared tolerably, when, in the days of Catherine, they were allowed 3*s*. 4*d*. per day, in good coin; but as this rate has never been augmented, and is now paid in paper depreciated 75 per cent., it amounts only to a miserable pittance. The consequence is, that embezzlement has become almost a fundamental part of the system; and, being accompanied with the waste and mismanagement too common in such great public works, has reduced the profits of government to a very small amount.

4605. *The other great mineral range is that of the Altaï*; and it is remarkable as being perforated throughout by ancient works carried on by a nation now unknown, and which have been long abandoned. If gold is less copious here than in the Urals, this deficiency is amply compensated by the mines of silver, which are so numerous that, according to Captain Cochrane, the whole district may be said to be silver. The original mines at Kolyvan itself are now fallen into comparative neglect, owing, perhaps, to the deficiency of wood. The chief present scene of operations is in the Schlangenbergl, the loftiest of the mountains in this part of the Altaï, and which, in the removal of its slate covering, presents an almost unbroken mineral mass of ores of gold, silver, and copper. In twenty-two years, it yielded 12,348 pounds of gold, and 324,000 pounds of silver. Copper, however, is the most valuable metal; for the iron, though inexhaustible, is considered scarcely fit to bear the expenses of transport. As soon as the ores are extracted, they are conveyed to Barnaoul, where forges on the most extensive scale are prepared to smelt and refine them. Twelve thousand horses and oxen, and 1500 workmen, are employed in this conveyance; and the entire number of persons engaged in the mineral operations is 13,000 constantly, and 55,000 occasionally; the latter being employed also as peasants to cultivate the ground. The entire value of the produce is 4,500,000 rubles, or 200,000*l*. sterling. Although the labourers are all serfs of the crown, and the wages very small, the extreme cheapness of provisions makes them tolerably comfortable; and the works, upon the whole, are managed much better and more advantageously for all concerned, than those of Catherinenberg. Silver forms also the prominent feature in the mines of Daouria at Argunsk, on the extreme frontier in the southern part of the province of Nertschinsk. In the beginning of the present century, they produced annually from 40,000 to 60,000 lbs. of silver; but recent details are wanting respecting their management and value. The entire produce of silver in Siberia is stated, in 1828, to have amounted to 1093 poods, which Humboldt estimates at 158,000*l*.

4606. *In simple minerals*, Siberia is also very rich; and these, though not so splendid as those of Southern Asia, present, perhaps, a greater variety. The topaz and the chrysolite are found at Mursinsk, among the Urals, which yield also the beautiful ore of copper, called *Malachite*, and very fine rock crystals, some of which, of a green colour, have even been mistaken for emeralds. The mountains of Daouria, and those round the Baïkal, produce the topaz, the beryl, the onyx, lapis lazuli, and red garnets. In 1829 the diamond, and in 1831 the emerald, were discovered in the Urals; but the extent of their produce is not yet ascertained. A remarkable and useful product is afforded by the mines of talc in

eastern Siberia, particularly on the banks of the Witim. This mineral supplies the place of glass over all Asiatic and part of European Russia. It is in many cases equally transparent, without being liable to break. It is divided by the insertion of a knife into thin laminæ, which, like pieces of glass, are valuable in proportion to their size. The rock salt at Solikamskoi, in the Urals, is worked to a great extent, and conveyed in huge waggons to Petersburg. Those singular efflorescences called rock marrow and rock butter are chiefly objects of curiosity, though the former is eaten by the Tunguses with milk, and the latter is sometimes employed in medicine.

4607. Second in value to mineral products, or even rivalling them, are those of *the chase*; a source of wealth no longer regarded as such in any part of the civilised world. In the eastern and northern parts of Siberia, on the contrary, the rich and soft furs with which nature has protected the animal creation from the rigour of the climate, form one of the most valuable articles of commerce. The most esteemed have always been those yielded by that species of weasel called the *sable*. Yakoutsck is the great market for them; and those obtained on the banks of the Witim and the Olekma are reckoned the best, selling at from 15 to 20 pounds a pair. In the lapse of ages, however, their numbers have been thinned by hunting; and it is necessary to go to Kamtschatka to find them numerous, though of inferior excellence. Great address is employed to take this animal, without injuring its skin. Sometimes it is struck by a species of arrow with a blunted point; at other times it is closely pursued till it runs up a tree, when the hunter kindles a fire beneath, upon which the sable drops down, and is caught in nets. Next to the sable ranks the black fox, of whose skin the very fine specimens sell sometimes for thirty pounds, and five pounds is a very ordinary price. The skins of the red and grey fox do not sell for more than two or three pounds. Those even of the bear and the wolf have a certain value. Among the useful animals of Siberia, it is impossible to pass over the rein-deer and the dog. The former are found in every part of Asiatic Russia, but chiefly on the bleak shores of the Northern Ocean, and among the Samoyedes; to whom, as to the Laplanders, they supply milk, clothes, and the means of rapid conveyance over the vast plains of ice. Only those taken in hunting are killed for the sake of the flesh. It is not in Kamtschatka only that the strong and well-trained Siberian dog is used as an animal of labour, and particularly in transporting sledges over the ice.

4608. *The supply of fish*, both in the rivers and the seas of Siberia, is inexhaustible, and only the distance and difficulty of transport prevents this from being an immense source of wealth. The Obi, and still more the Irtysh, abound with a very great variety of excellent species; including, besides those found in other rivers, sturgeon of peculiarly fine quality, very large sperlings, and several species peculiar to these rivers. The Yeniseï and the Lena are chiefly remarkable for fine varieties of salmon and trout. But it is the eastern bays of Asia, and the seas thence extending to America, that swarm with life in a degree almost unexampled. The most remarkable are those huge marine animals, the tenants of the frozen seas, against the cold of which they are fenced by thick skins, and a substance almost entirely composed of fat and oil. Whales take the lead among this class; but the coast seems peculiarly to swarm with the minor species, seals, otters, sea-calves, sea-wolves, and others of the same species. The skins of these animals, however, are the only part of them which can bear a transportation across the immense breadth of Siberia. Those of the sea-otter are said by Captain Cochrane to sell at from 10*l.* to 30*l.* in the market of Yakoutsck. The abundance of these and of ordinary fish maintains the eastern shores and islands in a state of plenty, independent of agriculture or pasturage. Indeed, we can scarcely credit the statement of Captain Cochrane, that 600 persons, inhabitants of the district of Nischnei-Kolymsk, consume between themselves and their dogs, 2,000,000 pounds annually; making fifty pounds a day to each person. Probably the fishery along the northern shore would not be less abundant; but the difficulty of carrying it on in frozen seas, and the cost of conveying its products, have hitherto prevented the Russians from attempting its prosecution to any extent. The numerous little lakes, the marshes, and inundated grounds of Siberia are covered with vast flights of waterfowl; and wild ducks, wild geese, swans, &c. afford an important resource to the inhabitants. On the whole, Siberia, particularly in its eastern tracts, would be the first country in the world for the sportsman, could he bring himself to endure the relegation from society which a residence in it would impose.

4609. *In no country has commerce to struggle against so many disadvantages.* Its northern seas are barred by ice; its eastern are too distant to hold any intercourse with the civilised world. The land communication from St. Petersburg extends over very little less than half the breadth of the globe, through tracts sometimes buried in snow, sometimes impassable by inundation, and sometimes destitute, for hundreds of miles, of a human habitation. Its rivers, though magnificent, all cross this great line at right angles, and consequently afford no accommodation for transit, except by ascending and descending the winding course of their tributaries, with frequent and laborious portages from one to the other. The country all round the frontier, and to a certain extent within, is infested by predatory hordes. Yet, under all this accumulation of obstacles, the commercial spirit in

Siberia is active. The Russian inhabitants, with the exception of the officers of government and the exiles, are almost all merchants, who, having taken up their abode in this dreary region under the hope of making a fortune with some facility, prosecute this object with indefatigable zeal. The transactions generally being of that speculative and adventurous cast which afford a chance of great gain, are attractive to bold and sanguine spirits.

4610. *The great line of Siberian commerce*, that leading from Petersburg by Moscow, Nischnei-Novogorod, Kasan, and Perm, crosses the Urals at Catherinenberg. It then proceeds direct to Tobolsk, and from that capital almost due east by Tomsk and Krasnoyarsk to Irkoutsk. The first of these places, with the Barabinski steppe, which precedes it, is sometimes avoided by ascending the Irtysh, and taking the route of Omsk and Barnaoul. At Irkoutsk, Russian commerce branches out into two great opposite lines. One of these crosses the Baikal and ascends the Selenga, to the contiguous towns of Kiachta and Maimatchin, which form the solitary point of commercial intercourse between the two great empires of Russia and China. Almost all the principal houses in Russia have an agent at Kiachta; while the Chinese traffickers consist chiefly of temporary visitors, who are not even allowed to bring their families. The Russians here receive the staples of China; tea, porcelain, silk, cotton, rhubarb, tobacco, with a variety of those little ornamental works in which that nation excels: in return for which, they give furs, skins, coarse cloths of various kinds, cattle, and glass. The value of articles exchanged on each side is supposed to amount annually to between 200,000*l.* and 300,000*l.*

4611. *The other commercial line*, branching from Irkoutsk, is that which descends the Lena into the heart of the frozen regions, and to the shores of the Eastern Ocean. Yakoutsk, about 800 miles down the Lena, forms the market at which the furs and other precious products of this desolate region are collected. They arrive, not only from all the surrounding wastes, but from Okhotsk, which collects those of Kamtschatka and of north-western America, and even from the remote north-east angle of Asia, which forms the peninsula of the Tchutchi. A considerable proportion consists of the tribute to government, which is easily paid, and profitably received in kind. The rest is obtained by the wandering traffickers, in exchange for tobacco, spirits, cutlery, beads, and toys.

SECT. VI. *Civil and Social State.*

4612. *According to an enumeration made in 1801*, the population of Siberia amounted to 1,038,356; of whom 515,114 were male, and 523,242 female. Considerable as this amount is in itself, yet, if we reckon the superficial extent at 5,000,000 square miles, we shall not have much more than one inhabitant to every five miles.

4613. *This very scanty population* consists of two very distinct portions, the foreign rulers and the native tribes. The latter, also, have scarcely any common relation, except that of having been all subdued by Russia. It will be necessary, therefore, to consider separately these different races.

4614. *The Russian inhabitants* are composed chiefly of that unfortunate class who have been exiled into these remote regions for various offences, chiefly those which excited the alarm of a jealous and absolute government. A basis was formed by the Swedish officers made prisoners at the battle of Pultowa, and a regular succession of recruits has since been furnished from the empire itself. As they were often men of cultivated minds and polished manners, and as, according to Captain Cochrane, "no government ever banishes fools," they, with their posterity, have formed at Tobolsk a society which has appeared agreeable even to those accustomed to that of the most refined European cities. Of the humbler class of convicts, those considered most incorrigible are plunged into the mines, where they are strictly watched, and subjected, as we have seen, to hard labour and hard fare. A class, whose offences are milder, find a place in the distilleries; while a third, who rank a step higher, receive grants of land, for which they pay only at the rate of eight rubles for each male head. These are formed into villages, where, according to M. Ermann, the strict police, and the miserable state of those who attempt to find refuge in the surrounding deserts, generally deter them from a repetition of the offences for which they were banished. Mr. Holman, however, complains that some make their escape, and form themselves into plundering bands, who infest the high roads; but they generally fall victims at no distant period.

4615. *The two great capitals of Siberia*, Tobolsk and Irkoutsk, have acquired, to a considerable extent, the polish of European society. In Tobolsk, as already observed, the basis of the population consists of exiles and their descendants, often men of rank and intelligence. In Irkoutsk, the merchants and the military officers, constantly passing and repassing from Europe, have imported its most recent manners, literature, and arts. Sievers, in 1790, found a small public library, a collection of natural history, and even a theatre, on which were represented some pieces of native production that were pretty tolerable. At Tobolsk, Kotzebue saw some of his own dramas performed; which was a great advance since Gmelin's visit, when the pieces resembled the European mysteries of the middle ages, in

which Adam, Noah, and the Devil acted the principal parts. Hospitality, the virtue of rude and recluse regions, is said to be most liberally exercised throughout Siberia. On the other hand, the Russian vice of drunkenness seems to be copied with most ample addition. In the small provincial towns, above all, where little exists to refine and animate society; where the facility of subsistence allows, and the severity of the climate compels, a great portion of time to be spent in indolence, it seems to be carried often to a most deplorable extent; and it then becomes, of course, accompanied with other species of dissoluteness. We regret that, from the narrations of the most recent travellers, the inhabitants of these provincial districts do not appear to have improved in this respect, or to have shaken off those slothful habits to which a great part of them have long been addicted.

4616. *Of the native Siberian races*, those which occupy the whole southern frontier are Tartar, both in their origin and character; and that people, indeed, until their conquest by the Russians, held the supreme sway in Siberia. West of the Irtysh, the prevailing race are those called Baschkirs; between that river and the Yeniseï are the Sluschivies, the Tzulimm, and other small local tribes; while the regions round the Baïkal, and to the south of it, are occupied by the Burats, a division of the Mongol family. All these Tartars are attached to the general habits of their countrymen; a wandering life, occupied almost exclusively in the rearing of cattle, and particularly of horses; making horse-flesh and fermented mares' milk their favourite luxuries. The sway of Russia has been in so far salutary as it has suppressed that system of perpetual war and plunder which was formerly carried on by them, and which still prevails in all the countries of Independent Tartary. Their activity is now more laudably turned to the multiplication of their flocks and herds, and sometimes to a limited degree of agriculture; though they have never duly improved in this respect the capacities of some of the tracts which they inhabit. In the western districts, as in the corresponding parts of Tartary, the Mahometan religion is followed; but, over all the east, full sway is held by that modification of the Indian system of Boodh which is called the Shaman religion. Sievers lately visited, beyond the Baïkal, the residence of the Bandida Lama, the great head of this religion, so far as concerns Siberia. The ceremonies do not seem to have materially differed from those which Turner observed to be practised in Thibet. A splendid throne was erected for the Lama himself, while the inferior priests, clothed in red, sat in successive rows. Numerous images were placed upon the altar, or ranged along the walls, to which were presented rice, brandy, and, on solemn occasions, a fowl or even a sheep roasted whole. Their sacred music was of the same noisy character. Kettle-drums, trumpets eight feet long, sea conchs, and others of the most powerful instruments of sound, produced a thundering and tremendous concert. These genuine Shamans, however, reject as heretical the bulk of their professed fellow-worshippers in this religion, who, in fact, introduce largely that mixture of magic and witchcraft which has always formed the favourite superstition of the north. The impostors who practise it, both male and female, endeavour to attract the admiration of the ignorant natives by huge horns or drums, throwing themselves into hideous contortions, and even giving themselves stabs in vital parts, from which blood, previously provided by them, appears to flow; but all this is done in so clumsy a manner, that it is at once detected by an European scrutiny. In the late enumeration, the Burats amounted to 49,761 males, and 47,932 females; while the Mongols proper were not more than 12,000.

4617. *Among the thoroughly native tribes of Siberia*, the most remarkable are the *Tungouses*. They are chiefly found in the extensive region watered by the Yeniseï and its tributaries the Toungouskas. Unlike the Tartars, they possess no herds, except those of rein-deer; and their sole employments are hunting and fishing along the frozen plains and the bleak shores of the great Siberian rivers. They use no arms in the chase except the bow and arrow, in which they are so skilful, that they fear not to attack the strongest and fiercest animals. As it is very desirable, however, not to injure the precious skins of the fur-bearing species, they are rather desirous to take them by art or stratagem, and show wonderful ingenuity in the contrivances which they employ for that purpose. They are not less skilful in tracing out by scent, or by the faintest track, the animals which they pursue. In fishing, they use little boats composed of the rind of the birch or of the larch tree. They have no settled abodes, but wander from place to place, guided by the abundance of fish and game, or by the mere love of change. It costs them very little trouble to construct temporary abodes. The *yourt*, or summer hut, is formed merely by arranging in a circular shape a number of wooden poles, and giving them a conical roof of the bark of the birch tree. Their winter abodes also consist of one single apartment, the wooden walls of which are more strongly put together, and the windows are formed of expanded bladder. The oven which heats the apartment and cooks the victuals is placed in a corner; and round the room are benches, on which the family sit, eat, and sleep; and which, being hollow, contain their stores and provisions. The smoke makes its way through an aperture in the roof stuffed with dry grass to exclude the cold; in its way thither it fills the entire hut, but, its own lightness causing it to ascend, there is left a space near the floor not absolutely enveloped. The Tungouses are of a brownish tint, derived, perhaps, from the atmosphere of smoky huts; their features

are flat, and their eyes small; though neither of these characters occur to nearly the same extent as in the Mongol race, nor have they its peculiar physiognomy. They are described, by those who have held intercourse with them, in terms of praise, as frank, stout, honest, and brave. Though professed votaries of the Shaman creed, they combine it much more than the Burat tribes with magical observances and other native superstitions.

4618. *The Yakoutes* occupy the banks of the Lena, and all the extent of wide and desolate plains which reach thence to the Eastern Ocean. The inroad of the Mongols and Burats is supposed to have driven them from the more southern tracts which they originally occupied. Their pursuits and habits of life much resemble those of the Tungouses, though they are considered, on the whole, as less daring and active. Far to the north, in particular, they dwindle into a poor and stunted race. Unable to procure bread, they have become, in a great measure, indifferent to it; and their vegetable food consists of various roots, as onions, garlic, and berries, which many parts of their territory produce in peculiar excellence. The superstitious habits which generally prevail among the natives of Siberia seem to have arrived at their utmost pitch among the Yakoutes. They reckon thirteen kinds of evil spirits, with the dread of which they are perpetually haunted; and the influence enjoyed by their magicians is unbounded. Their numbers, according to the census of 1801, amounted to 42,956 males, and 41,607 females.

4619. *The Ostiaks* are a numerous Siberian tribe, occupying the banks of the Lower Obi with its tributaries, and the plains which extend far on each side of it. Their size is somewhat diminutive; their hair, of a yellow or reddish tint, floats on their shoulders; and their features are destitute of all beauty. Their habitations, both of summer and winter, are nearly similar to those of the Tungouses, except that the latter frequently contain two or three families, divided by slight partitions, and having one common fireplace. They depend for subsistence chiefly on fishing, though they give chase to the bear and various fur-bearing animals; the finest of which, however, are now found only in the eastern regions. In these pursuits they display indefatigable activity, which their detractors impute to the pressure of want, since they show a disposition, when opportunity serves, to sink into indolent habits. They are said to be distinguished by great simplicity of manners, goodness of heart, and open hospitality. Their superstition is entirely that of the old rude paganism, without any Hindoo or Mahometan admixture. In their tents they have many little images, before which they place a table, and lay upon it snuff, willow bark, fish oil, and whatever commodities they themselves consider most valuable. In return for these gifts, they consider as due a prosperous fishing and hunting; and when, in spite of lavish donation, these fail, their wrath is sometimes kindled against their divinities, whom they even dash on the floor, and break in pieces. The bear is the object of a sort of fearful worship; and, in their oath of allegiance to the Russian government, they wish that, if it be not fulfilled, they may be devoured by that formidable animal. Their favourite amusement consists in a species of dance, in which they imitate to the life the motions and cries of the beasts, birds, and fishes with which they are daily conversant. The population, by the census of 1804, is stated at 17,236.

4620. *To the north of all the races now surveyed*, on the extreme shores of the Arctic Ocean, wander the *Samoyedes*, whom the poet denominates "the last of men." They present nearly the same original form as the Tungouses, but want and hardship have sunk them into a meagre and stunted race. They have a flat, round, and broad face, large thick lips, a wide and open nose, little beard, black and rough hair in small quantity. Their territory, along these dreary shores, extends for nearly 2000 miles, from the European frontier to the Olenek, and almost to the Lena. Placed in the same situation with the Laplanders, their habits and modes of life are almost entirely the same. All their wants are similarly supplied by the rein-deer; but the herds which they have tamed are employed solely for the purpose of conveyance; those only which are caught in the chase are used as food, and their skins converted into clothing. On the sea-coast they attack the bear, and feed on his flesh, as well as on that of the whales which are cast ashore. Fishing on the rivers is considered by them an easy and luxurious occupation. In autumn they are chiefly employed in hunting the white fox, the fur of which affords the only medium by which they can obtain foreign luxuries.

SECT. VII. Local Geography.

4621. *In taking a survey of the local features of Siberia*, beginning at its western or European extremity, we find, first, the already described mining district of Catherinenberg. It is politically attached, not to Siberia, but to the government of Perm, on the other side of the Urals. The capital, of the same name, situated near the source of the Iset, contains 2000 houses, built chiefly of wood, but some of stone; while the great manufactures are of brick roofed with thin iron plates. Here the Russian government has established the college of mines, which presides over all the founderies, 114 in number, maintained by it on both sides of the Urals.

4622. *The first territory that is wholly Siberian* consists of the province of *Tobolsk*. The government of this name comprehended once the whole, and still includes the better half, of Asiatic Russia. Tobolsk Proper, however, consists of the territory watered by the Tobol, the Lower Irtysh, and their tributaries. It forms an expanse of wide and watery steppes, covered with deep pastures and immense woods, and capable, in many places, where culture employed, of yielding the most luxuriant crops. Pallas particularly remarks the

district of Isetsk, or the plain of the Iset, about 200 square miles of the very finest, rich, black soil, capable of growing harvests that might feed a nation; yet it does not contain above 57,391 inhabitants. Of the same character are the plains of the Lower Tobol and Issim. Along these elevated confines of Siberia and Tartary, roam branches of the Kirghise horde, against whose inroads even the cordon formed by the powerful empire of Russia is not always a secure defence. Every where the basis of the population is Tartar; the prevalent race in the interior districts is the Baschkir, rather a quiet and substantial people; but still, as among other Tartars, their industry consists in the rearing of horses, and their indulgence in the eating of horse-flesh and drinking of mares' milk. The absence of any other agricultural industry condemns regions to waste that are capable of supporting the most extensive population. As to manufacture, the only process which can deserve that name is distillery, for the products of which there exists but too extensive a demand. Even in the very large establishment of Count Schouvalof, however, the machinery is so rude, and the tubes so defective, that a quantity of steam escapes, sufficient to intoxicate the bystanders, and to kindle at the approach of a flame.

4623. While the open country is in the possession of the Tartars, and the still ruder native tribes, the towns have a character very decidedly European. This is particularly the case of *Tobolsk*, the capital of this province, and of all Siberia. Its principal division is placed on a high rocky eminence overlooking a majestic plain, in which the Irtysh and the Tobol blend their mighty waters; while the horizon is closed on every side by a boundless expanse of forest. With the exception of the government houses and two churches, Tobolsk is built wholly of wood, and even the streets are paved with that material. The edifices are not constructed with any architectural skill; but the walls being white, and all the cupolas gilded, they make from their elevated site a very splendid appearance. The chief want is water, which can be procured only by a laborious carriage from the grounds below. The lower town, on the bank of the river, is Tartar, built wholly of wood, with water in abundance, but not of good quality. The basis of the social system at Tobolsk consists of exiles banished by a jealous government into their "prison of unbounded wilds;" and, from causes formerly specified, the society is upon a good European model, and Tobolsk makes an agreeable residence. The literature which, in the middle of the century, Gmelin found somewhat antiquated, is now, by the frequent passage of Russian officers, brought up to the latest German standard. All the trade of Siberia passes through Tobolsk. As soon as the first influence of spring has melted the snows, the merchants are seen crowding from the west, to traverse the long tract which leads to the Chinese frontier and the Eastern Ocean; and as soon as the winter sets in, similar crowds are seen returning. All the tributes of fur, collected from the tenants of the boundless deserts, are accumulated at Tobolsk.

4624. In the southern and western parts of the province of Tobolsk are Tara on the Irtysh; Jalutorosk and Kurgan on the Tobol, and Tumen on the Taura; small towns, surrounded by rich pastures, which enable the inhabitants to live in coarse abundance, and to carry on a considerable trade in timber, tallow, and hides.

4625. To the north, this region presents a very different aspect, as the Obi rolls to the Northern Ocean. Its dark and frozen waves are bordered by icy plains, or vast forests of gloomy pine, amid which a few handfuls of stunted and shivering natives erect their *yourts*, or movable tents. The Russians content themselves with maintaining here stations with a commissary and a few troops, not for the purpose of opposing a hostility which is not to be apprehended, but for collecting the fur tribute, which, though not very burdensome, would not be given quite spontaneously. Sourgout, above the junction with the Irtysh, is surrounded by a palisade, contains two churches, and 168 houses. Here grain cannot ripen; but white and black foxes, with other game, are found in abundance. Samarov, at the junction of the two rivers, is a position nearly similar. Still farther to the north is the district and post of Beresov, where domestic animals indeed may still be reared, but the rein-deer can alone be used with advantage. Finally, upon the Obi, before it opens into the great bay of that name, stands Obdorsk, a post of a few hovels and about twenty-five Cossacks, who collect the tribute of these desolate tracts. Amid the naked mountains of this northern extremity of Asia, attempts have been in vain made to introduce the plants and animals of civilised life: in a short time they have uniformly perished.

4626. Returning to Tobolsk, and proceeding thence southwards, we come to the provinces of Omsk and Kholuyvan, stretching along the Upper Irtysh and Obi, and separated from Tartary by the chain of the Altai. Of this region, already noticed as one of the most metalliferous in the world, the produce would exceed even the vast amount of that on the Urals, were not the land carriage too heavy for the bulky metals. Though fine pasture districts exist in these provinces, as in those on the western rivers, yet they are by no means of equal extent, and a great part of their surface consists of long chains of little saline lakes. In these the mineral covers the whole bottom of the lake with a layer of the most brilliant whiteness; but there is no room for the assertion which has been founded on this appearance, and which represents them as investing it with a crust like ice. The steppe of Baraba, and others which extend along these dreary regions, are almost covered with a forest of willows and other aquatics, and the air is very pestilential. The inhabitants, as Mr. Holman informs us, believe that there are plants which emit poisonous effluvia; but this is nothing more than the usual marsh miasma. The natives here are miserably poor, living in huts half sunk in the ground, covered with long coats of sheepskin, and in perpetual fear of Tartar incursion. This last circumstance, notwithstanding all the precautions used by the government, leaves uninhabited large and fine pastoral tracts along the southern border.

4627. The whole of this frontier presents features indicative of some great revolution, physical and political. Every where are found bones of elephants, buffaloes, and other huge animals, that belong to another and a distant climate, and some even to varieties that are no longer known to exist. Another feature consists in a vast number of tombs, extending along the whole of this line, and which were filled with gold and silver ornaments, coins, arms, evidently belonging to chiefs who ruled over a wealthy and powerful people. At the time of the earliest travellers, these tombs were a considerable source of wealth, and it was a regular employment to search them; but, by the latest accounts, they are now so completely rifled, as no longer to repay the trouble of examination. There are remains of edifices, but not corresponding to the grandeur of the sepulchral monuments. One ruin of considerable fame, called Semipalatnoi, or the Seven Palaces, appeared to Pallas evidently of Bucharian origin. He was much more struck by the ruins of Ablaikit, a temple which tradition reports as erected by a Calmuck prince of the name of Abloie. It was filled with upwards of forty images, representing all those huge, deformed, and often monstrous deities which are the objects of Shaman adoration. They were half male, half female; some had ten faces and seven arms; the features of others were hideous and inflamed. The edifice was sustaining daily injury from the Russian and Kirghise troops; and of the inscriptions, which were found in great abundance by the earlier travellers, only a few fragments remained.

4628. Upon this line the Russians maintain their grand chain of fortresses, by which the frontier is imper-

fectly defended from the inroads of the Kirghises. Omsk, the capital of a province, contains the head-quarters, and a garrison of 4000 men, with 7500 inhabitants. This garrison Captain Cochrane describes as maintained in admirable order. Government even supports a school for the children of the military, as well as another for those of the inhabitants. The military post is at Semipalatnoi, where 2000 men were stationed in garrison under as good management as at Omsk. Here is a great rendezvous of the Tartars and Bucharians, bringing the merchandise of interior Asia, and often their plunder, to exchange for tobacco and brandy. A little farther up the Irtysh is Ubinsk, "a dirty little spot, called here a town," and at a small distance beyond is Bouktarma, close upon the boundary of the Russian and Chinese empires. Captain Cochrane describes this as one of the most romantic spots in the world. From a vast plain covered with the most luxuriant herbage, but without a tree or a shrub, a number of detached, rocky, precipitous granite mountains start up and spread in various directions. Notwithstanding the richness of the pasture with which this plain is covered, it is a complete desert; "all this fair and fertile tract is abandoned to wild beasts, merely to constitute a neutral territory."

4629. In the east of Omsk is the province of *Kholyvan*, the seat of those immense mineral operations which have been repeatedly noticed. *Kholyvan* itself is now nearly deserted, less from the exhaustion of the mines, than of the timber, of which a large quantity is requisite, the metals being difficult of fusion. The town, therefore, is at present small, and little frequented. *Barnaoul*, to which, as already observed, all the metals drawn from the huge mineral mass of the *Schlangenberg* are brought to be smelted, is now the principal town of this district. It was found by a late traveller to contain 8000 inhabitants, and appeared the happiest, best governed, and neatest place in Siberia.

4630. *South-east of Kholyvan* is *Tomsk*, which, lying on the high road from *Tobolsk* eastward, is a great thoroughfare. Being used, however, almost solely as a passage, the business done there, though enough to support a population of 9000 or 10,000, does not maintain them in any stirring or active state. Travellers agree that drunkenness, and the habit of low sensual indulgences, those besetting sins of all the Siberians, are carried to a peculiar height at *Tomsk*. The surrounding country, naturally very fine, wears a general aspect of misery, and is over-run with birch and brushwood. The cottages of the inhabitants are extremely poor, and the little produce that is raised is half eaten by large herds of field mice. *Tomsk*, however, is the centre of a considerable trade in whisky, brought from the distilleries on the *Tobol* and the *Iset* for the supply of the eastern districts. *Kutznetz*, on the Upper *Tom*, is a small town, the inhabitants of which live in a state of lazy abundance.

4631. The direct and now most frequented route from *Tomsk* leads through the territory of *Krasnoyarsk*, the soil of which is among the richest in the world, and capable of yielding the most luxuriant crops, not of wheat, for which the climate is too severe, but of barley, oats, and other grain, which can endure the cold. It is cultivated, with some measure of industry, by a race of Tartars called *Sluschivies*, whose habits, however, are chiefly pastoral. The town contains about 3500 inhabitants, not exempt from the reigning vices of the country, but by recent accounts it appears to have been much improved by an intelligent governor.

4632. To the south of *Krasnoyarsk*, in a much bleaker region, is found the considerable town of *Yeniseisk*, the capital of a district. The land route by it to western Siberia is circuitous; but its position upon the great river from which it derives its name, at a very short distance below the junction of the almost equal tributary of the *Angara*, renders it a great centre of the river intercourse of Siberia. A water communication with *Tobolsk* is formed by the *Ket*, which falls into the *Obi*. On this dreary tract is found *Naryn*, a village with a church, and 100 houses, established solely to collect from these wide regions the tribute of furs.

4633. The *Yenisei*, after passing *Yeniseisk*, rolls for upwards of 1000 miles to the Northern Ocean, through a desert still more vast and dreary than that of the Lower *Obi*. *Turukshansk*, or *Mangasea*, is the name given to this awful world of desolation. It is occupied chiefly by the *Tungouses*, who, not in their persons, but in their habits and mode of subsistence, even in the construction of their winter and summer houses, considerably resemble the *Esquimaux*. *Turukshansk*, in the Russian archives called a city, is the smallest, perhaps, that bears the name, not having more than 100 inhabitants, who mostly reside within a little wooden fort defended by four guns. The trade and tribute of furs are the only source of subsistence. Its situation at the junction of the great tributary of the Lower *Toungouska* is favourable for this purpose. The vicinity is dreary, but enlivened by numberless flights of waterfowl.

4634. From *Yeniseisk* and *Krasnoyarsk*, population and commerce take a southern direction, and centre themselves at *Irkoutsk*. The position of this capital altogether fits it to be the emporium of Eastern Siberia. The *Angara* enables it to communicate on one side with the western rivers, on the other with the *Baikal* Sea, and that point of the Chinese frontier which is the scene of the most active land commerce of Russia. The *Lena*, again, which takes its rise not far distant, connects it with the Eastern Ocean, and with immense tracts, which, though destitute of all the necessaries and even comforts of life, abound in the most precious furs. Its prosperity and growth have, therefore, been rapid; and, from being a secondary city, dependent upon *Tobolsk*, it has been raised to be the seat of a government which comprehends all the eastern tracts now to be described. Travellers generally describe *Irkoutsk* as now the handsomest in external appearance, and the most elegant as to society, of any in Siberia. The houses, indeed, are chiefly of wood; but the streets are broad and spacious; some of the public buildings are very fine, and there are twelve handsome churches. The population, by the last census, consisted of 11,292, and has probably increased since. The principal inhabitants consist of merchants, chiefly connected with houses in *St. Petersburg*, and of the civil and military officers of government. Captain Cochrane laments, as the main bar to social enjoyment, the jealousy which reigns between these two parties: yet of such local and precarious application are those remarks, that Mr. Holman, his contemporary, considers the agreement between those very classes to be a subject of agreeable surprise. Both being in the habit of passing to Europe, have introduced whatever is most recent in its literature, as well as in musical and dramatic performance. A small library has been formed, as well as a collection of natural history; and government, among other seminaries, has founded a school for the instruction of the Japanese. The shops of *Irkoutsk* are filled with nankeens, porcelain, lacquered ware, and other articles of Chinese dress and furniture, and it has almost the aspect of a Chinese city.

4635. Descending the *Angara* from *Irkoutsk*, we enter the wide inland sea of the *Baikal*, which, as one of the grand features of Asiatic Russia, has been already described. Beyond it to the south, a scene opens altogether Mongolian. The country presents the sandy plains of Eastern Tartary, intermixed, occasionally, with good pastures. The Mongols, with the cognate tribe of the *Burats*, fill all the country; and even the Russian colonists imitate

their manners and language. The religion of the Lama is celebrated in all its pomp of sound and image; tea, formed as in Thibet into a pulpy mass, is the favourite beverage: all the habits and system of life are those of Middle Asia. Nertschinsk is the name given to this south-east corner of the Russian empire. The town of that name was once frequented as the main route to Kiachta; but since the merchants have preferred to ascend the Selinga, Nertschinsk derives its importance solely from its mines of lead and silver, which are very abundant. Their annual produce is usually 40,000 lbs. of lead; from which are extracted 250 lbs. of silver. The mines, like others, are worked by exiled convicts, whose situation is peculiarly hopeless, as the Chinese never harbour them. Westward from these metaliferous chains stretch the Yablonoy mountains, the most rugged, and perhaps the loftiest part of the great chain which here crosses Asia. Thick and continued forests, rocks, steep, morasses, and snow, cover all their higher pinnacles; these features render them impenetrable, unless to a few daring hunters, who make their way by paths scarcely distinguishable from the track of wild beasts. The prevailing form is that of a number of pyramids uniting in a broad summit resembling an apple; whence is derived the appellation Yablonoy.

4636. In order to facilitate the route to *Kiachta* up the Selinga, the Russians have built upon that river *Oudinsk* and *Selinginsk*, small towns, in a barren country, and merely supported by this transit. *Kiachta* has been already mentioned as the busiest scene of the commerce of Northern Asia, having been fixed upon by the treaty of 1728, as the only point at which commerce can take place between the vast empires of Russia and China. It stands on a naked, somewhat elevated plain, with lofty granite peaks rising round it on every side. It is closely contiguous to the town of *Maimatchin*, crowded with Chinese merchants, who resort thither for the purposes of this trade. The towns, however, are distinct; and each is surrounded by its separate fortification. Forts built on the pinnacle of two opposite mountains mark the boundary of the empire, being surmounted on the Russian side with a cross, on the Chinese side with a cone or pyramid. In consequence of the influx of strangers, the manners are said to be more polished and sociable than in other towns of Asiatic Russia, and the two nations mingle cordially in social intercourse. The Russians are even invited to the place, and entertained there; though, on the tolling of a bell at sunset, they must all hastily quit it. The European residents, in imitation of the Chinese, drink vast quantities of tea, and even annoy visitors by pressing upon them a beverage not generally the most agreeable to the Russian palate.

4637. We return now to *Irkoutsk*, to trace the line by which its domain stretches through the vast extent of its eastern wastes to the dimly explored ocean boundary of Asia. A north-east route of 600 miles leads to *Kirensk*, situated on the *Lena*, where it first begins to be a river of importance, and in a position equally convenient to travellers from *Irkoutsk* and from the *Yenisei*. The last traces of rich vegetation are here produced by a fertile soil, even amid the severity of the climate. It is also well situated for the trade in furs; and its sturgeon is reckoned the best in Siberia. With all these advantages it is no more than a village of about 100 houses. *Istkut* and *Olekminsk*, situated on the *Lena*, as it descends into the frozen regions, are merely small posts formed for the collection of furs, and for stages on the road to *Yakoutsk*.

4638. *Yakoutsk*, in the heart of this frozen territory, has still pretensions to the name of a city, since its ill built wooden houses contain about 7000 inhabitants. Nothing can be more bleak than its situation and environs. A few crops of rye are sown on a rich soil, but under a complete uncertainty whether they will ever ripen, in a climate where, in the end of June, the ground is still deeply frozen, and early in September the *Lena* is passable on sledges. Still, it is rendered a place of some importance by the rich furs which are either caught in the surrounding region, or brought from the opposite coast of America. The merchants make very high profits, both by the enormous price at which they sell tobacco, spirits, and other European commodities, and the low rate at which they obtain those of the natives in exchange.

4639. On the *Lower Lena* and *Olenek*, and within the borders of the Arctic Circle, the Russians have established *Gijansk* and *Olenok*, small posts for hunting and tribute. Near the mouths of these rivers, the Northern Ocean presents a number of isles, of which some are large. They have been carefully examined by the hunter *Liackof*, who discovered, even at the distance of about 200 miles from the shore, an extensive coast, to which some have given the name of New Siberia. The Russian government sent afterwards to examine it more carefully, but without being able to ascertain its extent and boundaries. Some even have imagined them to extend in such a manner as to become connected with the continent of America; but this supposition is now pretty generally abandoned. The aspect of these shores is, as might be expected, dreary and desolate; but they present one indication that is truly extraordinary, and gives much room for thought to those who speculate on the changes and destiny of the earth. There are found numerous bones and other remains of the elephant, an animal now altogether foreign to this part of the globe, or to any which is not separated from it by nearly a fourth of its circuit. Remains of that huge animal, of an extinct race, the mammoth, are also found at this extremity of Siberia.

4640. Proceeding from *Yakoutsk* eastward, we come to a more active and thriving scene. The traveller who ascends the *Aldan* and the *Joudama*, and after a short portage descends the *Okhota*, reaches *Okhotsk*, the emporium of the north-eastern seas of Asia. It is a neat, thriving, improving town, situated on a long narrow ridge between the sea and the river, and containing 1500 inhabitants. Nearly half of these are in the employ of government, which maintains them at an expense of 10,000*l.*; which sum, however, the revenues of the district do not pay. *Okhotsk* collects all the furs and skins of *Kamtschatka* and of north-western America, which last branch has of late received a great augmentation.

4641. A large and long peninsula, of peculiar character, called *Kamtschatka*, extends into the ocean which waters the eastern extremity of Asia. This territory is about 600 miles in length, by 300 in its greatest breadth. Its position on the globe ought to give to the greater part of it a climate like that of Britain; but the winds blowing from the plains of Siberia, and from the vast polar seas by which it is surrounded, induce an Arctic climate, and allow scarcely three months of summer. This cold is increased by the chain of mountains which traverses nearly its whole length, some of whose peaks rise, as already observed, to an extraordinary height. Attempts have in vain been made to rear, in *Kamtschatka*, the

coarsest kinds of grain peculiar to the most northern climates. There are, however, berries of various kinds, some roots, which when dried, supply the place of bread; and a gramineous plant, from which they contrive to extract a spirit. But the main compensation is in the profusion of animal life, which fills alike earth, water, and air, and in which no territory on the globe seems to rival this. A sportsman who should be willing to sacrifice to his favourite amusement the pleasures of civilised life would find Kamtschatka a paradise. The land animals afford a valuable prize, being all covered with rich furs, and very abundant. Though not quite so fine as those of Siberia, they form the basis of a considerable trade. The coasts swarm with seals and other marine animals; the rocks are coated with shell-fish; the bays are almost choked with herrings, and the rivers with salmon. Flocks of grouse, woodcocks, wild geese, and ducks, darken the air. Thus the inhabitants obtain in

685

MAN OF KAMTSCHATKA.

abundance not only food, but full materials for that gluttonous indulgence to which they are addicted. They form a peculiar race (*figs. 685. and 686.*), with flat features, small eyes, thin lips, and scarcely any beard. Their stature is diminutive, with large head and short legs. Since the Russian sway put an end to the wars which they were wont to wage with considerable fury, they have passed into a peaceable, honest, lazy, drunken, servile race, careless of

686

WOMAN OF KAMTSCHATKA.

the future, and addicted to coarse sensuality. They have houses both for winter and summer (*fig. 687.*). The former, composed of branches of trees, plastered with clay, are

687

SUMMER AND WINTER HABITATIONS AT KAMTSCHATKA.

half sunk in the ground; and in the interior one lamp, fed with train oil, lights, warms, and cooks the victuals of two families. The summer-house has a peculiar structure, its floor being raised by posts, twelve or thirteen feet from the ground, and leaving beneath an empty space, in which the fish is hung up to dry. In their domestic habits, the most remarkable peculiarity is the use of

688

SLEDGE AND DOGS.

dogs harnessed to the sledges (*fig. 688.*), and employed to draw them. These dogs are of no peculiar size or strength, but resemble our mountain or shepherd dogs. They are fed on the offal of fish, and in summer are turned out to find their own food; their return being certain at the approach of the inclement season. In travelling, the driver yokes them two and two abreast, and from four to ten in one vehicle, according to the weight to be drawn. He then places himself in the sledge,

which is in the form of a basket with two ends turned up; but no ordinary skill is required to prevent both rider and carriage from being overturned on the rugged ground over which it is frequently dragged. At their high festivals, the Kamtschadales give themselves up to an almost frantic mirth, which astonishes those who have viewed the sluggishness of their ordinary deportment. Their favourite dance is one in which all the actions and motions of the bear are represented to the life; and the violent and uncouth attitudes assumed for this purpose excite in the spectators rapturous admiration.

4642. Although the Kamtschadales, by connection with Russia, have gained an exemption from war, they have suffered deeply from the introduction of ardent spirits and of various contagious diseases. Their numbers have thus been diminished, and do not at present exceed 4600, of whom little more than half are natives; the rest Russians and Koriaks. Bolcheretzsk and Nischnei-Kamtschask, are small villages, which pass for towns; but the only place of any real importance is Petropaulowsk, or the harbour of St. Peter and St. Paul, a thriving little port, by which the merchants of Okhotsk carry on almost all the trade of Kamtschatka.

4643. *An archipelago of small islands, called the Kuriles, stretch from the southern point of Kamtschatka to Jesso, a line of nearly 900 miles. Twenty-two are known, of which nineteen are subject to Russia. Some are uninhabited, from the want of water; others rival Kamtschatka in the abundance of game and fish. The inhabitants are peaceable and well disposed; they live nearly as the Kamtschadales, but in a neater and more civilised manner; and some of the southern islands have imbibed a tincture of Japanese habits. Their subjection to Russia consists almost wholly in paying a tribute of furs and sea calves.*

4644. *A wild and remote country yet remains, in the extremity of Asia, into which only a few daring adventurers attempt to penetrate. All the features of Siberia are on an extensive scale; but scarcely any rival the immensity of its eastern deserts. Those who set out from Yakoutsck for the peninsula of the Tchutchi have to traverse nearly 2000 miles, in which there is only, at each interval of 200 or 300 miles, a post of eight or ten huts. On the intermediate spaces are placed, for the accommodation of travellers, *yourts*, or little square wooden huts, at the precise distance of twenty-five miles from each other, with a fireplace in the middle, for which the pine-woods always supply plenty of fuel. At length they reach Nischneï-Kolymsk, on a bay of the Arctic Ocean, at the mouth of the Kolima. This town, as it is here called, consists of fifty wooden houses, and about 400 inhabitants. The soil yields neither grain nor herbage; but a few horses and cows are kept half alive by cropping the tops of the bushes. In return, the waters yield food in boundless profusion.*

4645. *The gulfs of the Kolima and Anadir, belonging to the opposite oceans, enclose the extreme peninsula of the Tchutchi (fig. 689). This race, in their rude retreat, have preserved entire the independence so long lost by all the other nations of Siberia. They meet the Russians, however, for purposes of traffic, at the fair of Ostronaya, which, when visited by Captain Cochrane, was the resort of about 200 Tchutchi of both sexes and of all ages, and 500 reindeer. They are a stout, rough, honest, bold, and fearless race. Dear-bought experience has rendered them excessively jealous of the Russian traders, and by no means so easily cheated as formerly. They take off about 40,000 pounds of tobacco, averaging three rubles a pound, with various little articles of hardware, cutlery, and toys; in return for which, they give sea-horse teeth, various skins and furs of sea and land animals, the produce of their own coast, of the neighbouring islands, and of the opposite coast of America.*

689

TCHUTCHI.

CHAP. XIII.

JAPAN.

4646. *Japan bears an affinity to China, in the nature of its institutions, the character of its inhabitants, and the physical and moral circumstances which separate it from the rest of the world. Asia, in general, forms a vast continent of broad and unbroken dimensions; but to the east and south-east, it presents archipelagoes of islands, so large as to constitute entire kingdoms. The three which constitute Japan have, not without plausible grounds, claimed the title of empire. The empire of Japan is in fact so great, so populous, and marked by such striking and peculiar features, that, notwithstanding the complete state of insulation in which it holds itself from other nations, it justly attracts a large share of the curiosity of Europe.*

SECT. I. General Outline and Aspect.

4647. *Japan consists of three islands, one very large, and two smaller, which, being separated from each other only by narrow channels, form altogether one long, winding, irregular range of territory. The entire length, in an oblique line, from point to point, scarcely falls short of 1000 miles; while the breadth, in some places not more than forty or fifty, seldom exceeds 100, and never, unless in its most expanded central point, amounts to 200. Nippon, by much the largest, is about 800 miles long; Kiusiu, 150 miles long by 120 broad; Sikokf, 90 long, by 50 broad. The other islands are mere detached and local objects. The southern part of the large contiguous island of Jesso, comprehending all of it that is valuable and improvable, is completely colonised and possessed by the Japanese.*

4648. *The stormy seas which dash around Japan form the most prominent feature in its geographical position. To the east it faces the entire breadth of the Northern Pacific; which, with the intervention of scarcely a single island, reaches fifty degrees across to the coast of America. The south-western point of the range comes almost in contact with Corea, from which it is separated only by a strait of about eighty miles. Proceeding to the north-east, it recedes continually from Asia, till it leaves an expanse, nearly 700 miles broad, called the Sea of Japan. At the northern extremity this sea is narrowed by the large islands of Jesso and Saghalien, till it is formed into a species of close bay.*

4649. *The aspect of Japan* is bold, varied, abrupt, and striking (*fig. 691.*), without any

691

JAPANESE SCENERY.

single feature that is very prominent. Rugged chains traverse its interior, from several of which volcanic fire is thrown up; and Fusi, the highest and most northerly, is covered with almost perpetual snow. On the whole, however, these inequalities of surface are no more than necessary to supply the moisture requisite in so hot a climate; and an ample

proportion of the surface of Japan consists of rich valleys and extended plains, on which all the articles of tropical produce grow in the utmost abundance. Streams, pouring down from the interior heights, traverse the plains in endless numbers, and in every direction; but, in this narrow belt, the receptacle of the sea is every where too near to allow them to acquire the character of great rivers. There are no lakes of any magnitude; but the coast is indented with many deep and broad bays, which penetrate the interior, and afford the most important aid to internal commerce.

SECT. II. *Natural Geography.*

SUBSECT. 1. *Geology.*

4650. *These islands* contain several volcanoes of considerable extent, concerning which some few details have been published by travellers; but the geognostical relations of the other formations of the group are not known to us.

4651. The precious metals, *gold* and *silver*, abound in the empire of Japan. The gold is obtained principally from a pyritical ore of copper; smaller quantities are collected from alluvial soils of various descriptions. Rich mines of *silver* are said to occur in the province of Bungo, and the most northerly parts near Kattami. There are considerable *copper mines* in different districts. *Iron* is said to occur but seldom, or it is less extensively mined than copper, as the natives do not make so much use of it as most other nations. They sometimes employ it in the manufacture of arms, knives, scissors, and other necessary implements. The gold and copper are coined into money. *Cinnabar*, the ore of mercury, is also met with in Japan. *Sulphur* is found in great abundance; *coal* occurs in some of the northern provinces; beautiful kinds of *amber* were received by Thunberg from the natives; and a reddish brown *naphtha* is used for burning. *Asbestos*, *porcelain earth*, *tourmaline*, *schorl*, and *marble* are also enumerated among the mineral productions of Japan.

SUBSECT. 2. *Botany.*

4652. *Japan**, like China, is under the influence of an Oriental clime: its temperature is much lower than that of Morocco, Madeira, and the peninsula of Spain, which lie under the same parallels. The islands of Kiusiu and Sikokf, and the southern part of Nippon, terminate, eastward, the Transition Zone. These islands are intersected by mountains, some of them of considerable height. The summers are very hot; but the thermometer sinks a great deal in winter. From observations made by Thunberg in 1775, at Nangasaki, lat. $32^{\circ} 45'$, it appears that the mean annual temperature is but $+ 16^{\circ}$; owing to which the Bananas, grown in the vicinity, do not bear fruit. In August the greatest heats take place, when the thermometer rises to $+ 36^{\circ}$ or 37° , sometimes to $+ 43^{\circ}$. The winter begins in January and closes in February, during which the quicksilver varies between $+ 21^{\circ}$ and $- 2^{\circ}$. Occasionally snow whitens the ground, and the surface of the water is covered with ice. The island of Nippon is traversed by the northern limit of the Transition Zone. It is needless to attempt to determine precisely the line of this zone: the temperature of Nippon is unknown to us; and as to its vegetation, our only information is derived from Thunberg, who travelled in 1776 from Nangasaki to Jeddo, under the surveillance of an escort which did not permit him to deviate from the road. At Osaka (lat. $34^{\circ} 5'$) there is a botanic garden, containing many of the productions of the empire; and where *Dracæna revoluta*, *Laurus Camphora*, and other species which require a mild temperature, grow in the open air. The Tea plant, which, with the *Camellia* and *Lycium barbarum*, forms all the hedges in Kiusiu, grows also on the slopes of the mountains between Meaco and Jeddo; but the Tea appears to be of the number of those plants which a considerable degree of heat in summer protects against the effect of winter. It is probable that the mean temperature of Jeddo is much lower than that of Osaka and Nangasaki.

* From Mémoires du Mus. d'Hist. Nat. vol. xiv. p. 442.

4653. *The trees on the mountains of Nippon consist generally of northern species ; such as the Lime Tree, the Scotch Fir, the Pinus Cembra and P. Strobus, the Spruce and Larch. To the north of Nippon, in the island of Jesso, at Matsmai, lat. 42° (only 7' north of Rome), the winter is long and severe ; the thermometer falls to — 18° or — 19° ; and a thick bed of snow covers the ground from November to April.*

4654. *Thunberg has made us acquainted with 755 Japanese flowering plants ; most of them collected in the environs of Nangasaki and some adjacent islands. This specimen of the vegetable productions of the country suffices to give an idea of its general character. It may be called an Insular Flora ; and of Japan, as of many other islands, it appears probable that the vegetable population was originally very small, and has gradually increased by colonisation.*

4655. *Among these 755 flowering plants, we may observe 240 of the old continent ; some from India, as Salix japonica, Eleagnus umbellata, and the Orange tree ; also the Citrus Decumana and Paper Mulberry, the Camphor tree, and Bamboo, the Pride of India, &c. ; some Chinese species, as Podocarpus macrophylla, Cupressus patula, Thuja orientalis, Ficus pumila, Quercus dentata, Bladhia japonica, Olea fragrans (fig. 692.), Sophora japonica, Ailanthus glandulosa, the Sasanqua and Camellia, the Anise tree (Illicium anisatum), the Hydrangea (fig. 693.), Cycas revoluta, Raphis flabelliformis, &c. : others belong to the*

OLEA FRAGRANS.

HYDRANGEA.

SALISBURIA ADIANTOIDES.

western portion of the Transition Zone, as the White and Black Mulberry, the Oleander, the Pomegranate, Zizyphus vulgaris, Tamarix gallica, Ilex aquifolium, Cercis Siliquastrum, some species of Prunus, Pyrus, Amygdalus, Ficus, &c. ; some, again, which are common to all the northern parts of Europe and Asia, as the Yew, the Juniper, the Scotch Fir and Larch, the Spruce and Pinus Cembra, the Chestnut, Birch, Alder, Ash, Elder, and White Willow. There are, likewise, about 30 North American kinds ; among which are Rhododendron maximum, Sambucus canadensis, Bignonia Catalpa, Magnolia glauca, Æsculus Pavia, Pinus Strobus, Juniperus bermudiana and barbadensis, Juglans nigra, Amorpha fruticosa, Vitis Labrusca, &c. To a botanist, the combination must be very interesting of these various types, belonging to the vegetation of such distant lands, here growing on the same soil. In the more southern part of Japan, the plants of warmer districts are not unfrequent ; as the Camelliaceæ, Ternströmiaceæ, Sapindaceæ, Magnoliaceæ, Bignoniaceæ, Ardisiaceæ, Gardeniæ, Begoniæ, Amoma, Epidendra, and Com-

CYCAS REVOLUTA.

melinæ ; one Palm and one of the Cycadeæ, &c. ; but, in general, the prevailing generic types are those of the other parts of the Transition Zone in the old continent.

4656. *The most remarkable shrubs and trees hitherto seen in Japan are, Salix integra, Betula japonica ; Quercus glabra, glauca, acuta, cuspidata, and serrata ; Cupressus japonica, Thuja dolabrata, Salisburia adiantifolia, Podocarpus Nageia, Taxus nucifera and verticillata, Celtis orientalis, four or five Eleagni, four Laurels, Osyris japonica, Nerium divaricatum, Diospyros Kaki, Syringa suspensa, Callicarpa japonica, Volkameria japonica, Vitex rotunda, Clerodendrum dichotomum, Paullinia japonica, Magnolia obovata and Kobus, Citrus japonica, six species of Acer, three of Vitis, six of Ilex, several of Prunus and Cratægus, &c.*

4657. *To Japan, as well as China, the gardens of this country are indebted for some of*

their choicest, though not most numerous, treasures; of which several are quite hardy, as the *Hydrangea hortensis*, *Pyrus* (*Cydonia*) *japonica* and *Mespilus* (*Eriobotrya*) *japonica*, the Anise tree (*Illicium anisatum*), and that favourite evergreen, *Aucuba japonica*, the *Salisburia adiantoides* (fig. 694.) and *Sophora japonica*; while the deliciously scented *Olea fragrans*, and the useful *Cycas revoluta* (fig. 695.) require the protection of our green-houses.

SUBSECT. 3. Zoology.

4658. Our zoological information of this remote and little known empire remains nearly as imperfect now as it was fifty years ago, when the celebrated botanist Thunberg visited Japan. It seems that neither sheep nor goats are esteemed by these curious people; very few swine are seen, and the only use made of the cattle is to draw the ploughs. If the population is as great as travellers represent, the wild quadrupeds must long ago have been diminished, or nearly extirpated.

4659. A few Birds of unusual splendour, or of singular structure, appear peculiar to this part of Asia. The Japan peacock is a totally distinct species from that of India, although about the same size. For a long time this superb creature was only known to naturalists

696

SILK COCK

by a painting sent to the Pope, and even its existence began to be doubted, until the celebrated Le Vaillant, by great good fortune, met with a living specimen in a menagerie at the Cape of Good Hope, and thus established the truth of its actual existence.

4660. Among the Domestic Fowls of Japan are two most singular races, said also to be inhabitants of the native forests. One is the Crisped Cock (*G. crispus* Tem.), having the whole of the feathers curled up in such a manner as to appear, at a little distance, like wool; its colour is usually white. The other is the Silk Cock (fig. 696.) (*Gallus lanatus*), and presents an equally strange deviation from the usual course of nature; the webs of the feathers being so entirely disunited that the bird appears covered only with silky hairs; this also is white: the flesh is considered so delicate as to exceed that of the best ordinary capon.

SECT. III. Historical Geography.

4661. Japan was entirely unknown to the ancients, and is not mentioned by any of their historians. The empire, however, has records, which affect to detail its revolutions for a period long anterior to that which we are justified in assigning to the origin of human society. Of the seven celestial spirits, who ruled it for more than 1,000,000 years, nothing need be said. The second dynasty, though it commenced 15,000 years before the creation, includes, probably, a considerable admixture of truth. The emperors were mere human beings, and they are represented, according to the probable course of things, as having come from China, and introduced, among a yet barbarous people, the useful arts, medicine, and a tincture of the sciences. The third period, which may be considered as fundamentally genuine, is referred to the sixth century before the Christian era. It was marked by the accession of the *dairis*, who laid claim, not, indeed, to divine attributes, but to a descent from the early celestial rulers; and they, as "sons of heaven," and ministers of the Deity, continued to exercise over Japan a mingled civil and ecclesiastical sway. It appears probable, however, that their power over the greater part was little more than spiritual; and that its varied districts were held by civil princes in almost independent possession. The *dairis*, as they sunk into voluptuous indolence, devolved into the hands of the *cubo*, or general, that military power which can with such difficulty be prevented from becoming paramount. This, in the course of the sixteenth century, gave rise to a complete revolution in the political situation of Japan. A succession of brave and able *cubos* found means to reduce all the petty princes under subjection to the general government, and at the same time to monopolise the supreme direction of affairs. The profound veneration, however, entertained by the nation for the *dairi*, and the sacred character with which they supposed him to be invested, rendered it impossible that he should be wholly superseded. He still enjoyed ample revenues to maintain his dignity, with an absolute control over all spiritual concerns, leaving the solid and temporal power to the *cubo*, who has ever since maintained it without interruption on the part of the *dairi*, and, by a course of severe and determined measures, has held all the formerly independent princes in a state of complete vassalage.

4662. The intercourse of Europeans with Japan is to us the most interesting part of its history, though it has scarcely affected the destinies of the empire itself. The Portuguese, who were the first explorers of this as well as of every other part of the Asiatic coast, did not at first encounter that deadly jealousy with which Japan was afterwards closed against Europeans. Not only were they allowed to establish a factory, and carry on a great trade at Firando, but no opposition was made to the introduction of missionaries, for diffusing the

Catholic religion. St. Francis Xavier, the celebrated apostle of the East, made Japan the great theatre of his preaching. After some obstacles, considerable progress was made; several of the princes or tributary kings, with a considerable proportion of their subjects, embraced the new faith; and an embassy was even sent to Philip II. and the pope. In no long time, however, these fair promises began to be clouded. The nobles became impatient of the restraints imposed by their new profession; and the perpetual jealousy of a despotic government was kindled by the introduction of new doctrines, habits, and ideas, from a foreign nation, who might employ this change as a prelude to conquest. Some rash steps taken by the missionaries, and, probably, the report of Portuguese proceedings in other parts of Asia, raised this hostile disposition to the utmost pitch. A general persecution was commenced against all, both native and foreign, who held the new faith; and it was carried on with an unrelenting severity characteristic of the nation. The series of studied torture employed was not, perhaps, surpassed by that which the Roman emperors inflicted on the early converts. The Japanese Christians suffered long, with a constancy peculiar to themselves; but at length, having to do with a government which knew not pity, they were either exterminated or overawed. The Portuguese, at the same time, were put to death or expelled. That nation, in 1640, made a last attempt, by sending an embassy of seventy-nine individuals, to open a new commercial intercourse. But these, by orders from the Japanese court, were all put to death, with the exception of thirteen, whom the magistrates sent back with the following mandate:—"You are to inform your fellow citizens, that henceforth the citizens of Japan will not receive either money, merchandise, or presents from them; you see that we have burnt the very clothes of your dead countrymen. Let your people use in the same manner any of ours who may fall into their hands; we make them welcome, and desire they will think no more of the Japanese than if there were not such a nation in the world." And on a chest containing the dead bodies was written:—"Henceforward, so long as the sun shall shine upon the earth, let not any Christian be so daring as to set his foot in Japan."

4663. *The Dutch* were too fully possessed with the spirit of commercial enterprise to be checked by these deadly warnings. Assuming the most submissive deportment, and, as has been alleged, denying the faith on account of which their predecessors had been expelled, they succeeded in establishing a factory at Firando. This being soon considered too wide a field, they were removed to the smaller spot of Nangasaki, where they have ever since been allowed to remain under restrictions progressively severe. They have at length been circumscribed as in a prison; allowed, indeed, to carry on a certain portion of trade, but without ever passing the allotted boundaries. All attempts made by other European states have completely failed. The most persevering have been those of Russia, which, after the possession of Kamtschatka and the Kuriles, became the immediate neighbour of Japan. Russia was exceedingly desirous of opening this intercourse, and even established a school at Irkoutsk, for the education of Japanese youth. In 1804, Captain Krusenstern sailed to Nangasaki on an official mission. Although a Dutch vessel was just sailing for Batavia, the two nations were not allowed to speak to, or even look at, each other. The Russians were well supplied with provisions and repairs, but were allowed to land only after a long interval, and then upon a narrow neck of ground, where they were watched as closely as they would have been in the Seven Towers at Constantinople (*fig. 697*). After

AMBASSADOR'S HOUSE AT NANGASAKI.

being detained for many months, and their solicitations for permission to proceed to court evaded under various pretexts, a deputation came down from the capital, announcing the irrevocable decision, that no Russian vessel could be allowed to enter Japan. Some years afterwards, a Japanese vessel having been saved from shipwreck on the coast of Asiatic Russia, hopes were entertained that this circumstance might open the way to friendly communication. With this view, Captain Golownin was sent to Matsmai, the Japanese capital of Jesso. If he was invited on shore, however, it was only to be thrown into close and rigorous durance, in which he was detained for many months. Orders were then sent to liberate him; but, as might be expected from such a prelude, they were unaccompanied with the slightest concession in favour of Russian commerce or intercourse. Golownin learned, during his confinement, that

SECT. IV. *Political Geography.*

4664. *The division of power between the ecclesiastical and the military potentate* is the most remarkable peculiarity in the government of Japan: the one holds the highest rank, and the first place in the veneration of the whole nation; the other absorbs all the solid realities of power. In this relative position they have remained for several centuries, wishing, but not venturing, the one to recover the lost reins of sovereignty, the other to dispel the phantom which holds dominion over the minds of the people.

4665. *The dairi*, who resides at Meaco, appropriates the whole revenue of that city and its rich adjoining territory. In order, also, that he may maintain the full pomp of a sovereign, a liberal allowance is held due to him out of the general revenue. This, however, is all in the hands of the cubo, who often finds it inconvenient to make the payment, and has recourse to apologies which, whether satisfactory or not, the other has no means of disallowing. Thus, a proud poverty reigns in this sacred court, which is greatly increased by the circumstance, that all the members of the blood royal, sprung from the early divine rulers of Japan, now amounting to many thousands, must be so maintained as not to bring contempt upon the race. A considerable number find employment in religious functions, and in the numerous monasteries; but others are reduced to great straits, and the descendants of the celestial spirits are obliged to support their outward dignity by privily manufacturing straw hats, horseshoes, and other humble handicraft productions. Every nerve, however, is strained that all around the dairi himself may present the most imposing aspect of magnificence. Fantastic attributes are ascribed to him, which may appear to raise him above every tincture of mortal imperfection. His foot is never to be profaned by touching the

ground, and he is never to be moved from one place to another, unless upon men's shoulders. It is considered unlawful for him to cut off his hair, nails, or any thing which can be held as forming part of his person; but the extreme inconvenience of this rule has led to the somewhat poor evasion of taking them from him during sleep. On his death the next heir succeeds, whether male or female, at whatever age. Yet the strictness of this hereditary principle did not prevent disputed succession, while the sovereign power centred in the dairi; but, in his present humbled state, the courtiers are studious to adjust all discussions in a quiet manner, in order to prevent any external interference.

4666. *The cubo*, or temporal sovereign of Japan, rules with an authority which admits, in principle, of no limitation. In fact, however, it stands on a very different footing from that of the despotic monarchies of Asia. The provinces are ruled, not by satraps appointed and removable at pleasure, but by princes, once warlike and independent, and only reduced, after a hard struggle, to bend to the will of a conqueror. They thus form a sort of feudal aristocracy, residing in large and strongly fortified castles; but have no right to meet in council, nor any legal control over the actions of the monarch. They retain, however, lofty sentiments of independence, to guard against which, the most rigorous precautions are taken. They are obliged to leave the greater part of their family at court as hostages, and themselves to reside there for a great part of the year. When discovered or believed to be engaged in any measure hostile to the government, death is the immediate and irrevocable sentence; and the only mitigation granted is that of being allowed to procure it by their own hands.

4667. *The laws of Japan*, in general, may be said, even more emphatically than those of Draco, to be written in blood. They seem to struggle against a spirit in the nation hostile to the despotic principle, and which is made to bend to it only by the most powerful impulse of terror. Cutting in pieces, piercing the belly with a knife, immersion in boiling oil, are common modes of punishing the guilty. The parent suffers for the crime of the child, and the child for that of the parent. A remnant of republican constitution is preserved in the division of cities into wards, to which the maintenance of the police is intrusted, but under the penalty that each ward must be responsible for the crime committed by any of its members. Of these violent measures, however, the result really is, that the security of person and property is very complete, and that capital punishments are even rendered more rare than in most other nations. Around Nangasaki only, examples of this unrelenting severity continue more frequent, in order to extirpate every remnant of Christianity, and also to punish the instances of contraband traffic which private interest prompts, in the face of the most rigorous prohibitions.

SECT. V. *Productive Industry.*

4668. *The Japanese rank with the richest and most industrious nations of Asia*, though they confine themselves so entirely to their internal resources. In particular, their fertile soil, and even those parts of it to which nature has been least bountiful, are improved with the most exemplary diligence. Thunberg, in travelling through tracts the site of which was most favourable for the production of rare and curious plants, flattered himself with ample means of indulging his taste for botany; but his hopes were completely baffled by the laudable exertions of the Japanese farmers, who, classing all such productions in the rank of weeds, had waged a successful war of extermination against them. The basis of their culture is Chinese; and they resemble that people in the extreme care with which manure is collected. The husbandmen, must, indeed, be hardly treated, if, according to Kæmpfer's statement, they are obliged to pay to the landlord six parts out of ten. Rice is the pride of Japanese agriculture, and the main staff of life. That which is raised on the best soil is said to be finer, whiter, and more easily preserved, than any other in Asia. Next in utility ranks the *daid-su*, a species of large bean, which, being made into a pulp, serves like butter as a condiment to season many of their dishes. Wheat and barley are also standard grains, though not to an equal extent. Turnips are the culinary product which serves most for the support of the people. Of trees, the mulberry is considered the most valuable, and affords the material of the staple manufacture, though none of it is equal in quality to the finest produced in China. Tea, being in as universal demand as in that country, is cultivated all over Japan, but with care that it do not encroach on any more essential product; for which reason it is planted only in hedges, or in spots unfit for the spade or plough. One of the most valuable trees is the arusi, from which distils the precious varnish employed by the Japanese in the rich lackered ware peculiar to the country. The fig and chestnut are their principal fruits. Fir and cypress furnish the timber chiefly employed for ships; but the bamboo, for the beauty of its growth, and the various forms into which it can be manufactured, is the wood most prized by the Japanese.

4669. *Quadrupeds*, both wild and tame, are the property with which this empire least abounds. The wild animals, in a country where every spot of ground must be turned to account, are studiously extirpated; and room is found for the tame only in so far as they may be necessary instruments in cultivating the ground. Even this is performed much more than in Europe by mere manual labour. Oxen, and a large species of buffalo, with a hunch on the back, are chiefly used for carriage and ploughing. Horses, usually of a small size and not very numerous, serve for state and travelling. There are neither asses, mules, camels, nor elephants. Only a few hogs have been brought over from China; and the very few sheep and goats introduced by the Portuguese at Firando have never multiplied. The economical habits of the Japanese combine with their religious principles in interdicting the use of animal food; and milk, cheese, and butter form no part of their diet. Dogs, by imperial favour, have been allowed to multiply till they have become almost a nuisance, though they are little used in hunting.

4670. *Fishery* forms a very extensive source of Japanese subsistence. Besides the species known in India, they have whales which come down in large numbers from the Polar seas, and are caught, as in Greenland, with the harpoon. They are highly prized, less for the oil than as articles of food: every part, — the flesh, the skin, the intestines, even the cartilage of the bones, — is boiled, roasted, fried, and eaten. The rocky coasts which surround Japan are covered with tortoises, crabs, oysters, and shell-fish of all descriptions, which are eagerly collected for food.

4671. *Minerals, however, form the peculiar wealth of Japan.* Gold is found in a quantity amply sufficient, at least, for internal supply; though some of the rumours respecting its abundance appear to be fabulous. The mines having, of late, shown some marks of exhaustion, it has become the policy of the emperors to economise them, and to prevent the export of gold. Silver is considered to be rather scarcer. But copper is the metal which Japan produces most plentifully, and of a quality finer, more malleable, and fitter for use than any other in the world. A considerable quantity of gold is often combined with it. Though iron ore abounds in one part of the empire, it is not generally diffused, and is, on the whole, both scarcer and dearer than copper. This last named metal, therefore, is usually employed in household vessels, the fitting up of ships, and other works elsewhere made of iron. Pearls and amber are found in considerable quantities on the shores. Submarine plants, corals, corallines, mushrooms, sea fans, occur in singular beauty and variety, but are little valued by the natives.

4672. *The manufacturing industry of the Japanese*, though not so remarkable as that which they display in agricultural pursuits, is still considerable. It is exerted on the same branches, and after the same models, as with the Chinese, — silk, cotton, porcelain; but none of them is carried to equal perfection. There is one process, however, that of covering their vessels with a rich dark varnish, and raising above it artificial flowers and ornaments, which derives its name from Japan, and in which that nation excels all others. They are well acquainted with the art of working metals, and particularly the fabrication of arms; and also with the making of glass.

4673. *Perhaps no nation so large and so rich is so great a stranger to foreign trade.* The Chinese, though so much limited as to intercourse with strangers, have yet huge junks, which sail through all the Oriental islands; but nowhere is a Japanese flag ever seen. Their vessels, little better than boats, and of a clumsy construction, are unable, notwithstanding the use of the compass, to do more than creep along their own coast. The Chinese alone are allowed to visit the more considerable ports of the empire, and to exchange raw silk and some of the finer manufactures, for metals and lackered ware. The Dutch have only a corner of the port of Nangasaki, where, enclosed in a sort of prison, and subject to every humiliation, they are allowed to dispose of two annual cargoes. They import various articles of colonial produce, spices, and hardware, in return, chiefly, for the unrivalled copper which this country produces, with some lackered ware and other trifling articles. As they make, however, a profit of 20,000*l.* a year, they continue, notwithstanding some menaces, to brave all the mortifications, and even dangers, which attend this traffic. Commerce, thus confined almost entirely to the interior of the empire, is very active within that sphere. All the shores and bays appear crowded with barks, conveying from place to place the various products of the provinces. The roads are excellent, and thronged in an amazing degree; they are kept clean by the mere anxiety of the people to collect the mud as manure. The broad and rapid torrents in the mountainous districts are crossed by handsome bridges of cedar, well fenced, and always kept in the most perfect repair.

SECT. VI. *Civil and Social State.*

4674. *The population of Japan* cannot be estimated on any precise data. Its superficial extent has been rated at about a tenth of that of China, and, according to all appearance, the population must be nearly as dense. If China, then, contain 200,000,000, Japan will have 20,000,000.

4675. *The Japanese seem, in personal appearance*, to be a somewhat altered and improved variety of the Mongols and Chinese. Their eyes are even in a greater degree small, pointed, oblong, sunk in the head, with a deep furrow made by the eyelids; they have almost the appearance of being pink-eyed. Their heads are in general large, and their necks short; their hair is black, thick, and shining from the use of oil. They are, however, robust, well made, active, and easy in their motions. Their complexion, yellow and passing into brown, appears to be entirely produced by the climate; since ladies who are constantly protected from the heat of the sun are as white as in Europe.

4676. *The national character* is strikingly marked, and strongly contrasted with that which generally prevails throughout Asia. The Japanese differ most especially from the Chinese, their nearest neighbours, notwithstanding the resemblance in form and lineaments. Instead of that tame, quiet, orderly, servile disposition, which makes them the prepared and ready subjects of despotism, the Japanese have a character marked by energy, independence, and a lofty sense of honour. Although they are said to make good subjects, even to the severe government under which they live, they yet retain an impatience of control, and force of public opinion, which renders it impossible for any ruler wantonly to tyrannise over them. Instead of that mean, artful, and truckling disposition so general among Asiatics, their manners are distinguished by a manly frankness, and all their proceedings by honour and good faith. They are habitually kind and good-humoured, when nothing occurs to rouse their hostile passions, and they carry the ties of friendship even to a romantic height. To serve and defend a friend in every peril, and to meet torture and death rather than betray him, is considered as a duty from which nothing can dispense. Good sense is considered, by Thunberg, as a prominent feature; and it appears particularly in their dress, which they seek only to render substantial and suitable, despising those glittering ornaments which are so eagerly sought over all Asia. The greatest defect seems to be pride, which runs through all classes, rises to the highest pitch among the great, and leads them to display an extravagant pomp in their retinue and establishment, and to despise every thing in the nature of industry and mercantile employment. It has the still worse effect of giving rise, on any injury, real or supposed, to the deepest and most implacable resentment. This passion, which decorum and the rigour of the laws prevents from breaking into open violence, is brooded over in silence, till the opportunity of vengeance arrives. Forced often to bend beneath a stern and powerful government, they are impelled to

suicide, the refuge of fallen and vanquished pride. Self-murder here, like duelling in Europe, seems to be the point of honour among the great; and the nobles, even when condemned to death by the sovereign, reserve the privilege of executing the sentence with their own hands.

4677. *This people differs also from the Chinese in being of a deeply religious character.* There are two religions in Japan; one native, called the Sintos, at the head of which is the dairi; the other, the Boodh, called here Budso, the same which prevails over all eastern Asia. The Budso gains ascendancy by mingling with the original system those attractive accessories which it possesses in common with the Catholic, — monasteries, processions, beads, drums, noisy music, and the belief of purgatory; which, though condemned by the pure and orthodox Sintoists, has a general influence over the people. The Sintos profess to believe in a supreme ruler of the universe, and among their number is distinguished a class of pure and philosophic worshippers, who entertain lofty conceptions of the Deity, and cultivate the practice of virtue as the chief means of gaining his favour. Their belief, however, being thought to resemble the Christian, fell into some discredit, when the latter became the object of such deadly persecution. The mass of the nation, for whom such tenets were far too refined, have always been addicted to gross and varied superstition. Deified kings and heroes, rulers of the respective elements, local genii, who preside over woods, form the usual and natural elements. Amid the paucity of real animals, they have invented also a number of fanciful and mythological creatures, who are the objects to them of a species of worship. The dragon, also a Chinese monster; the *kirin*, a winged quadruped, and the *foo*, a beautiful bird of paradise, are all accounted peculiarly sacred. The religion of the Japanese deals much in festivals, of which they have five great annual ones, besides three smaller, celebrated every month, rather with visiting, eating, drinking, and somewhat disorderly mirth, like the bacchanals of the ancients, than with any observance that can properly be called religious. But pilgrimage is the custom to which they adhere with the greatest zeal, and from which they promise themselves the greatest benefit, temporal and spiritual. No one can be accounted at all eminent in sanctity, or have any assurance of the forgiveness of his sins, who has not been once a year at Isje, the grand temple of the *Tensio Dai Sir*, or first of the celestial spirits, situated in a province of the same name. The roads in summer are completely choked with the crowds of devout worshippers, on their way to the sacred shrine. As many have not the means of paying their own way, a large proportion betake themselves to begging, and, prostrate on the ground, call out to the rich passengers, “A farthing to carry me to Isje!” In order to draw notice and favour, they exhibit images of a many-headed idol, called Quanwan; of Amida, the judge of departed souls; of Temacco, keeper of the prison of condemned souls; of Driso, supreme commander of purgatory; and of other deities. Others seek to gain acceptance by praying, singing, playing on fiddles, guitars, and other musical instruments, or by the performance of juggling tricks. On meeting with success in any of these departments, they often betake themselves wholly to the pursuit, and make a permanent increase to the crowds of beggars with which the country is infested. Such a step they consider themselves fully privileged to take, after they have shaved their heads, and devoted themselves to a particular religious order. Among these shaved beggars are prominent a class of *bikerni*, or nuns, who appeared to Kæmpfer the handsomest females he had seen there. Many of them had exchanged for it an employment the least honourable to their sex, which they were suspected not to have wholly relinquished. Isje, the object of all these pilgrimages, presents nothing that corresponds to its fame, or the magnificence of the empire. It is rather held forth as a monument of antique poverty and simplicity. It is a mere low wooden hut, with a flat thatched roof, and the interior contains only a looking-glass of cast metal, and some cut paper, to both of which a mythological import is assigned. In the surrounding plain are about 100 chapels, equally of poor materials, and so small that a man cannot stand upright in them. To each of these is attached a *canusi*, or priest, under one of whom the newly arrived pilgrim places himself. After a due round of prostrations, supplications, and, above all, of gifts, to the utmost amount of his real or supposed ability, he is presented with an *ofurrai*, or indulgence, consisting of a small oblong box, filled with little pieces of wood wrapped in white paper, which is supposed to ensure the pardon of sins, and exemption from temporal evil for a year to come; at the end of which period, no zealous Sintoist is satisfied unless he can undertake another pilgrimage. Even those who are not so fortunate carefully preserve their *ofarrai*, and consider it through life as a valuable possession. The Budso temples are much more magnificent than those of the Sintos. They are placed usually on an elevated spot, surrounded with beautiful groves. Their ornaments, but for the peculiar form of the idols, would make the traveller imagine that he was in a Roman catholic cathedral.

4678. *Of the progress of the Japanese in arts and sciences our knowledge is very scanty.* Their language, their mode of printing, and their ideas on speculative subjects, are fundamentally Chinese. They are far, however, from displaying that proud indifference and disdain of every thing foreign, which bars all approach to improvement. Their minds are active, and imbued with the most eager curiosity on all subjects. On the few occasions allowed to them by the jealous rigour of their government, they have harassed Europeans with

multiplied questions, respecting those branches of knowledge in which they felt and admitted their superiority. Their attention seemed peculiarly devoted to astronomy, and the calculation of eclipses. According to M. Titsingh, they have herbals drawn and coloured with taste; maps and plans carefully designed, though destitute of the important particular of latitudes and longitudes. Poetry is held in honour; but no specimens have yet been afforded that can enable us to judge of their proficiency in this noble art.

4679. *The buildings in Japan* are of excessively slight materials, — the walls of clay; so that a smart kick would beat a hole through them. The interior is divided into partitions with pasteboard, and the walls covered with paper, which, in the houses of the great, is elegantly painted and varnished. As the natives sit on the floor, there is no occasion for chairs, tables, or that variety of furniture which graces a European apartment. Pomp is chiefly displayed in the number and beauty of the mats with which the floor is spread; and the great imperial hall is called "the hall of the thousand mats." Every thing is kept nicely clean and fresh as if new. Such habitations, however, are little better than matches to kindle fire; so that, notwithstanding a large depôt of water kept at the top of every house, the cities are often desolated by the most dreadful conflagrations.

4680. *The diet of the Japanese* is remarkably simple. They surpass the Hindoos in abstinence; not only avoiding animal food, but even milk and its productions. Hot rice cakes are the standard food, and are kept ready at all the inns, to be presented to the traveller the moment he arrives, along with tea, and occasionally *sacki*, or rice beer. Tobacco affords the chief and constant social indulgence. Their dress is equally plain. It consists merely of a large loose robe, resembling our bed-gown, made of silk or cotton, and varying in the

698

JAPANESE COSTUME.

different ranks only as to the degree of fineness. They have straw shoes, which they put off at the door. They shave their head, leaving only a tuft on the crown, and usually have it bare, unless on their journeys, when they cover it with an enormous cap, made of plaited grass or oiled paper. (fig. 698.)

4681. *In travelling*, the Japanese spend more time than perhaps any other nation. The *tokaid*, or main road, is described by Kämpfer to be usually as crowded as the streets of the most populous city in Europe. This is owing to their numerous pilgrimages; to the extent of their inland trade; and, most of all, to the immense retinues which attend the princes in their annual journeys to and from the court of the cubo. The retinue of one of the very first rank is computed to amount to 20,000, and covers the roads for several miles.

First appears a crowd of outriders, cooks, clerks, and other inferior functionaries. Behind is the heavy baggage, which is followed by a number of secondary nobles, also attended with numerous retinues. The prince then appears, surrounded by a varied and splendid train, composed of led horses, servants richly dressed bearing lackered chests, pikes ornamented with feathers, rich scimitars, and other arms. The household officers, with considerable trains of their own, close the procession. That such a retinue may pass without inconvenience or collision, all the inns are engaged for a month before; and in all the towns and villages on the route, boards are set up to announce that, on such a day, such a great lord is to pass through.

SECT. VII. Local Geography.

4682. *Japan must, no doubt, comprise many interesting local features*; but these being shut with such jealous care against Europeans, and all hope being excluded of viewing or visiting them, they are to us almost as if they existed in another planet. Something must, however, be said of the two capitals, civil and ecclesiastical, Jeddo and Meaco.

4683. *Jeddo*, now the seat of the ruling power, and the real capital of Japan, lies at the head of a deep bay on the eastern coast of Nippon, and at the mouth of one of the few rivers which possess any considerable magnitude. It is seven miles long and five broad, and contains many splendid palaces of the great lords, all of whom must reside in it for a great part of the year. These mansions are surrounded by wide enclosed courts and extensive gardens; yet they cannot be said to possess much architectural grandeur, since they are only one story high; the walls of clay, the partitions of paper, and adorned merely with painting, varnishing, and fine mats spread on the floor. The palace, however, though equally low, is built of freestone, and is five leagues in circumference, including a wide exterior area occupied by the spacious mansions of the princes and great lords of the court. Its grand apartment, the hall of the thousand mats, is said to be 600 feet long by 300 broad, and is brilliantly adorned by pillars of cedar, painted papers, and gilded dragons on the roof. The city is subject to dreadful fires, one of which, in 1703, consumed 100,000 houses. It is the seat of varied branches of industry, and carries on also a great internal trade.

4684. *Meaco* is at a considerable distance from Jeddo, near the southern extremity of Nippon, at a little distance in the interior. This spiritual capital of Japan is still the chief seat of polished manners, refined arts, and intellectual culture. The finest silk stuffs flowered with gold and silver, the richest varnishes, the best painted papers, and the most skilful works in gold, silver, and copper, are here manufactured. It is likewise the centre of literature and science, and most of the works which are published and read in Japan issue from its presses. Although there is no longer the means of supporting the same display of pomp and wealth as at Jeddo, yet there is a grander display of architectural ornament. The palace, or enclosed city, of the sovereign is on a similar plan; but the religious structures, though built only of cedar, are some of them truly splendid, richly gilded, and placed in the most picturesque and commanding situations. Kämpfer calculates that there are, in and around Meaco, not less than 3893 temples, served by 37,093 *suikku*, or priests. Of these, however, the greater part are only wooden huts, and have nothing within but a looking-glass and some cut white paper. The lay inhabitants, according to the last enumeration, were 477,000, and the ecclesiastical, including the court, 52,000; making in all, 529,000.

4685. *Osaka*, at the mouth of the river on which Meaco is situated, is a flourishing sea-port, intersected, like Venice, by numerous canals, which are connected by bridges of cedar.

4686. *The Japanese*, as already observed, have now occupied all the southern parts of the great island of *Jesso* which are accessible and improvable. *Matsmai*, the capital, is supposed, by Golownin, to contain 50,000 souls.

4687. *Nangasaki*, that interesting point at which alone this empire comes in contact with any European nation, must be noticed in closing our account of Japan. It is a large, industrious, trading town, containing sixty-one streets, arranged without much beauty or order. On the small adjoining island of *Dezima*, separated from it only by a narrow channel, the Dutch are allowed to carry on their scanty commerce. They have here a space of 600 feet long by 120 broad, on which they have erected several large storehouses, and rendered them fire-proof. The most unheard-of precautions are taken to prevent any contraband transaction, commercial or political. The pockets of the officers and crew are turned inside out, and the hands passed over the clothes, and through the hair. The trunks and chests are emptied, and the boards struck, lest they

should contain any secret cavity. Long wires or pikes are thrust through the cheeses, butter tubs, and jars of sweetmeats. Dezima is to the Dutch a complete prison, the gates of which are locked every night, and a guard set over them. Buried in this dungeon, they remain ignorant of all that is passing in the world, and gradually lose all curiosity on the subject. Even the faculty of the will becomes extinct, for want of exercise; so entirely are they under the control of the Japanese. Yet it is confidently asserted that these accumulated precautions are insufficient to guard against the powerful impulse of self-interest, and that contraband trade is carried on to a considerable extent.

4688. The little that is known respecting the *peninsula of Corea* may, with propriety, be appended to the account of the Japanese islands. From them it is separated by the Straits of Corea, and by the Yellow Sea from China. The country, 400 miles long by 150 broad, is traversed from north to south by a chain of mountains; and, though some parts are sterile and rugged, it contains a considerable extent of fertile and well-cultivated plains. A great part of what was once supposed to be main land was found by the expedition of Captains Hall and Maxwell to consist of an almost innumerable archipelago of small islands, extending along the western coast. Corea is ruled by a sovereign who pays homage and a small tribute to China, but in his general sway is entirely independent. The people are very little known, but appear to be tall, handsome, and brave. The British expedition, as it sailed along, was treated with the utmost courtesy; but the same jealous anxiety to debar strangers from any access into the interior was conspicuous, as in China and Japan. The arts and letters of China have been to a great extent imported, and Corea has the same written language, though its spoken one is entirely different. Men of letters undergo similar examinations, and hold the same conspicuous place as in that country. Quelpaert, off the southern coast, is distinguished by its lofty mountain, beautifully covered with cultivation. The capital is Kingkitao, an inland town, situated nearly in the centre of the country.

CHAP. XIV.

EAST INDIAN ARCHIPELAGO.

4689. *The East Indian Archipelago* is the name usually given to a range of fine and large islands, lying east of Hindostan, and south of the Indo-Chinese countries and of China. Although they have few political ties with each other, and each island is even subdivided into separate states, the aspect of nature, the state of civilisation, the peculiar character of the people, present such a similarity, that they may be advantageously treated under one head.

SECT. I. *General Outline and Aspect.*

4690. *The principal islands* of this range are Sumatra, Java, Borneo, the Molucca or Spice islands, and the Philippines; and it includes, also, several smaller islands and groupings. The archipelago, in general, has, on the east the Pacific, on the west the Indian Ocean; and seas and straits, connected with these, separate it on the north from the Indo-Chinese countries and China, on the south from the great islands of New Holland and New Guinea. Situated almost directly beneath the equator, it extends from east to west somewhat more than thirty degrees, or 2100 miles.

4691. *Mountains*, in lofty ranges, and bearing often a volcanic character, traverse the interior of all the great islands. Mount Ophir, in Sumatra, according to the measurements of Captain Nairne, rises to the height of 13,842 feet. The peaks of this tropical region, however, seldom exhibit that dreary and desolate aspect usual at so great an elevation. On the contrary, they are crowned almost to their pinnacles with lofty forests, luxuriant shrubs, and aromatic plants, presenting the most varied and picturesque scenery.

4692. *Rivers* cannot attain any great magnitude, in a region thus broken into islands, each of which has a high chain of mountains extending through its length, which leaves only a plain of moderate breadth between it and the sea. The streams are numerous, and highly beneficial for irrigation. They are perennial, produced by rains which, in countries so near the equator, fall constantly throughout the year; while those of Hindostan are dry during six months. Many of them form at their mouth commodious harbours, and minister to the purposes of trade; but, from the causes above stated, can be only of limited and local importance. *Lakes*, from the same structure, are comparatively few; though some, imperfectly known, exist in the interior of the mountain regions, particularly of Sumatra and Luconia.

SECT. II. *Natural Geography.*SUBSECT. 1. *Geology.*

4693. *The geology of the Indian Archipelago is so very imperfectly known, that we cannot lay before our readers more than the following notices.*

4694. *Sumatra.* Four volcanoes, one of them called Gunong Dempo, rising about 12,000 feet above the level of the sea, are described as existing in this island. Granite and other primitive rocks are enumerated as products of Sumatra; and trap, limestone, and clays, probably of tertiary formation, form the lower parts of the country.

4695. *Java.* Several ranges of volcanic mountains and hills, some of them 12,000 feet high, exist in this island. Extending from these are considerable tracts of low and flat country composed of limestone, clay, marl, and salt, which may be of tertiary formation. In these tertiary districts there occur *salses* resembling those at the foot of the Apennines, and also numerous salt springs.

4696. *Banca.* The principal mountains in this island are composed of granite, with its generally associated gneiss and mica slate. These are said to be immediately bounded by a formation of red ironstone; but Crawford, who makes this statement, gives no description of the formation. The low tracts are deeply covered with alluvium, which abounds in tinstone.

4697. *Borneo* appears to abound in primitive and alluvial formations; the secondary and tertiary, and those of volcanic origin, have not as yet been accurately described. This great island is traversed by several chains of mountains, of which the principal one ranges north and south, not far from the east coast. These mountains abound in primitive rocks, which in many places afford numerous and large rock crystals. The lower districts contain various secondary formations, more or less deeply covered with alluvium. Volcanoes are mentioned as occurring in different quarters. The island is celebrated for its gold and diamonds.

4698. *Philippine Islands.* These islands are represented as very mountainous, and abounding in volcanoes and sulphur.

4699. *Molucca Islands.* The largest island of the group, Celebes, is said to be very rugged and mountainous. It contains several volcanoes in a state of activity; and primitive rocks, of various descriptions, more or less richly impregnated with gold, and diversified with cavities lined with rock crystals, occur in many quarters. The volcanic tracts afford immense quantities of sulphur. The smaller islands of this group are principally of volcanic formation.

4700. *The Indian Archipelago*, as Crawford remarks, so remarkable for the rich variety of its vegetable and animal productions, is hardly less distinguished for its *mineral wealth*. The mineral products which particularly deserve notice, in a commercial point of view, are the following:—tin, gold, copper, iron, salt, sulphur, and the diamond.

1. *Tin.* Here, as in Europe, the only ore of this metal is the oxide of tin, or *tinstone*. In geographical distribution, tin is confined to the island of Banca, the Malayan peninsula, and the islets on its coasts, with *Junkceylon*. It exists either in greater abundance, or is obtained with least labour and difficulty, in the island of Banca, which affords at present by far the greater quantity of the tin of commerce of the Archipelago. In Banca, the principal mountains are of granite; while those of inferior elevation, according to Crawford, are of red ironstone. In the low tracts between these the tin ore is found, and hitherto always in alluvial deposits, seldom farther than twenty-five feet from the surface. The strata in which it is found are always horizontal. The tin of Banca and the other Indian islands finds its way into almost every part of the world; but China and the continent of India are its principal markets.

2. *Gold.* Next to tin, gold is the most valuable of the mineral products of the Archipelago. It is universally distributed throughout the Archipelago, but abounds most in those countries which are composed of primitive and transition rocks. It is most abundant in those islands which form the western and northern barriers of the Archipelago, and exists but in small quantities, rarely worth mining, in the great volcanic range extending from Java to Timor-laut. Borneo affords by far the largest quantity. Next to it is Sumatra, and, in succession, the *peninsula*, Celebes, and Luçon. In the great island of

New Guinea gold occurs, but in what quantity is not known. In the Indian islands gold occurs either in fixed rocks or in alluvial deposits: the fixed rocks, mentioned by Crawfurd, are granite, gneiss, mica slate, and clay slate. The gold is never absolutely pure; always containing silver, and frequently copper. The gold of Banjar-laut, for example, usually contains, in 100 parts, gold 90 parts, silver 4 parts, and copper 6 parts. The gold of Larak, in the same island, affords, in 100 parts, gold 86 parts, silver 6 parts, and copper 8 parts. The gold of Pontianak, in 100 parts, contains 83 parts of gold, 16 of silver, and about 1 of copper. A small part of the gold of commerce of the Indian islands is obtained by mining in the solid rocks; some from washing the sand and mud of brooks and rivers, but by far the greater portion by washing deposits of gold in alluvial districts. The annual amount of gold thus collected throughout the Archipelago is estimated by Crawfurd at 658,176*l.* sterling.

3. *Iron and Copper.* Iron and copper are, besides tin and gold, the only metals found in the Indian Archipelago. Iron occurs but in small quantity. Copper ores are met with in Sumatra, Timor, and in the territory of Sambas in Borneo. Copper is found in its native state in Sumatra and Timor.

4. *Diamond.* Borneo is the only Indian island which affords the most precious of all known minerals; and there the diamond is confined to the south and the west coast, principally in the territories of the princes of Banjarmassin and Pontianak. The principal mines are at a place called Landak, from which the diamonds of Borneo, to distinguish them from those of Hindostan, are usually designated. It is the same country that is most remarkable for the production of gold, in which the diamond is found. The diamond is in great repute among all the natives of the Indian islands, and, indeed, is the only gem in much esteem, or much worn by them. One of the largest known diamonds is now in Borneo, in the possession of the prince of Matan, and was found in the mines of Landak about a century ago. It is still in its rough state, and weighs 367 carats. Its real value is 269,378*l.*

5. *Sulphur.* There is no volcanic mountain in Java that does not afford sulphur, but the best and most abundant supply is obtained from the great mountain of *Banyuwangi*, at the eastern extremity of the island. Here, and in similar situations in Java, and other volcanic islands of the Indian group, sulphur is obtained without difficulty, and in such a state of purity as to require no preparation for the market.

6. *Salt.* Salt springs occur in several of the islands, more especially in Java, where they are very abundant. Much of the salt of commerce is obtained from these spring waters by evaporation.

SUBJECT. 2. *Botany.*

4701. *Tropical Islands of Asia.* — Under this head we include Ceylon, with the islands of the Malay archipelago; a country eminent, from the earliest times, for the splendour of its vegetable productions, and more especially for their fragrance. But of all their wonderful productions, the most remarkable yet discovered is the *Rafflesia Arnoldii* (*fig.* 700.); a plant without stem, without leaves, with roots so minute that they are em-

RAFFLESIA ARNOLDII.

bedded in the slender stem of a species of vine, and as it were incorporated with that stem, yet bearing a flower of the most enormous dimensions. It is a native of Sumatra, and is one of the surprising novelties detected there by Sir Stamford Raffles, and his friend and medical attendant, Dr. Arnold. The first appearance of this extraordinary flower, upon the stem of the vine on which it grows parasitically, and where the seeds happen to alight, is that of a small tubercle,

which almost resembles a swelling in the bark. This gradually enlarges, still preserving its rounded form, till the bud has attained its full size. It then considerably resembles a large cabbage. At length, the flower (the entire plant, indeed) expands, and presents a blossom of the most gigantic stature. Its diameter is three feet and a half, its weight fifteen pounds, and the hollow in the centre is of the capacity of fifteen pints, English measure. The thickness of the petals is not less than an inch and a half near the base: the colour a brick red, inclining to orange, wrinkled or embossed on the surface, and marked with deeper blotches of the same colour as the ground, and with white spots. The plant is diœcious. The stamens form a sort of beaded circle around a central abortive pistil; which is itself a large fleshy excrescence, flat at the top, and beset with elongated pro-

jections, which Dr. Arnold declares resembled cow's horns. This superb flower soon decays, and is endowed with a most powerful but disagreeable odour, which, like that of the *Stapelias*, attracts flies in great abundance. The plant has been admirably illustrated by the learned Brown, in the twelfth volume of the *Linnean Transactions*; yet, notwithstanding his excellent description, and the accurate explanatory figure with which it is accompanied, from the pencil of M. Bauer, clearly showing its title to a place among the Phænogamous or flowering plants, Sprengel, in his *Systema Vegetabilium*, has, strange to say, arranged it along with the Cryptogamic plants, and near to the Fungi! It is undoubtedly the largest known flower in the world.

4702. *Scarcely less interesting*, if we consider the structure of its foliage, is the famous *Nepenthes distillatoria* (fig. 701.), or Pitcher plant, a native of a considerable portion of

PITCHER PLANT.

Southern India, especially the islands, and formerly supposed to be peculiar to Ceylon. Other species, and even more curious in the nature of the leaves, are found in Java; but we shall confine our remarks to the species above mentioned, which has now attained to great perfection in the stoves of our botanic gardens, especially those of Mr. Loddiges, and the Royal Gardens of Edinburgh and Glasgow.

4703. *There is not a more interesting spectacle* of the kind, perhaps, in all Britain, than to behold the fine plant of *Nepenthes* which exists in the stove of the Botanical Garden at Edinburgh. Planted in a tub, whose soil is kept constantly moist by a covering of living *Sphagnum* and other Mosses, its stem, 18 to 20 feet long, rises from the midst of these; it is branched, and climbs among the wires that traverse the rafters of the roof, supporting itself by means of its tendrils, bearing, especially towards the extremity, very many leaves, which look more like the contrivance of art

than a production of nature. The whole leaf, including the petiole or stalk, is two feet and more in length. The petiole itself is, below the middle, winged with a very broad margin, to that degree that it is commonly taken for the leaf itself; upwards, it forms a long, stout, filiform cirrus, or tendril, which is more or less spirally twisted, even when it does not catch hold of any surrounding object to support the parent stem. Its extremity hangs down, and is terminated by the true leaf, or leafy portion; but which, from its remarkable appearance, is called an *appendage* to the leaf. Instead of being flat, it is hollowed out, like an elongated pitcher; it is six to nine inches long, attenuated at the base, where it is curved or arched, and then it suddenly turns upward. It is obscurely striated, and on each side, at the front, marked with two prominent wings or membranes; it is ventricose upwards, slightly expanding at the mouth, which is oblique; in a young state completely and firmly covered by a lid or operculum, which is flat, and marked with two winged nerves, and fixed by the back to the upper margin of the mouth. After a time, this lid opens, still continuing attached by a point at the back; but which, though in the act of opening it supplies the place of a hinge, is not capable of any further movement: the mouth of the pitcher, which is heart-shaped, is now quite exposed to view, and exhibits a remarkably thickened margin, which is closely, transversely, and most beautifully plaited. The colour of the pitcher is pale green, often tinged and spotted with red, purple within, where it is glandular, especially near the base.

4704. *As if the better* to deserve the appellation of a pitcher, this curious leaf contains a watery fluid, which is secreted by the plant itself; for it is often most abundant while the lid is perfectly closed, and when the water could not be received by any external agency. Neither is this fluid of the nature of common water. In each of the unexpanded pitchers of the Edinburgh plant was about a drachm of limpid fluid. "This," says Dr. Graham, in his description of the plant, in the *Edinburgh New Philosophical Journal*, for 1827, "had a subacid taste, which increases after the rising of the lid, when the fluid slowly evaporated. My friend, Dr. Turner, perceived it to emit, while boiling, an odour like baked apples, from containing a trace of vegetable matter, and he found that it yielded minute crystals of superoxalate of potash, on being slowly evaporated to dryness. The pitcher whose contents Dr. Turner analysed was a large one; it had not opened, and the whole fluid weighed only sixty-six grains."

4705. *In the plants* at the Glasgow Royal Botanic Garden, there is generally a very considerable quantity of this fluid, after the lid is expanded and the pitcher has attained its full developement; and, whether in pursuit of that liquid or from any other cause we are not able to say, insects are attracted thither in great quantities, and ants in particular; so that the pitchers are often found quite black within, from the accumulation of the dead bodies of the latter; and the quantity thus destroyed is very great.

4706. In Ceylon, in China, and the other parts of India, where this plant is a native, it is probable that the secretion is far more abundant than when cultivated in our stoves; and, if we may credit the narration of travellers, the pitcher is generally filled with a clear limpid fluid, and the lid is then closed; the latter opens during the day, and the water is reduced by one half; but this loss is repaired during the night, so that next morning the pitcher is replenished, and anew closed by the lid. This alternate closing and opening of the lid is at variance with what we have observed in our plants. Small aquatic shrimps, too, Rumphius tells us, inhabit the fluid.

4707. In some parts of India, Rumphius and Flacourt assure us that the natives entertain some curious and superstitious notions respecting this plant. They believe that if they sever the pitchers and pour out the water, it will not fail to rain during the day. When they dread this state of weather, they are very careful not to cut the pitchers. On the other hand, in periods of great drought, they hasten to the woods, sever the pitchers of the *Nepenthes*, and pour out the liquid, firmly persuaded that rain will then ensue.

4708. The generic name *Nepenthes* is derived from two Greek words, signifying, without sorrow. Homer speaks of an Egyptian plant called *Nepenthes*, which was employed by Helen to dispel grief from her guests: in the same way, probably, Linnæus, who applied the name in the present instance, might suppose that the liquid contained in the pitcher was calculated to allay the thirst and consequent misery of the traveller. The word *distillatoria*, it will be immediately perceived, implies the secretion and concentration of the fluid in the pitcher. Thus we see how admirably are the names of plants calculated, in many cases, to characterise some property residing in the plant itself, or to impress some portion of its history on our minds!

4709. We have a striking instance, in the plant cultivated at the Edinburgh Botanic Garden, of the importance of the stamens and pistil of plants. We have already observed that the *Nepenthes* is dioecious. The Edinburgh plant was a stamiferous one, and flowered annually; but, of course, bore no fruit. In the stove of Professor Dunbar's garden was a pistilliferous one; which, standing by itself, was equally barren. The blossoms of the latter were dusted with the farina from the former, when the germen ripened into perfect fruit.

4710. The appearance of the germinating plant is most curious. The minute seeds, produced by the process just mentioned, readily vegetated on being sown in the spring in pots of peat earth, covered with a plate of glass, and standing in pans of water. They began to sprout in April and May. The plumule rises before the cotyledons are expanded: when the latter takes place, the first little pitcher appears in the centre; then the radicle pushes through the arillus in the opposite direction from the plumule. In a rather more advanced state, three pitchers are evolved, each with its closed lid, which is slightly mucronated; and there are, upon the body of the pitcher, two prominent and ciliated wings. The cotyledons now begin to wither and to become deflected. Five pitchers are formed. These little pitchers, destitute of the broad leafstalks, present a truly extraordinary appearance, rising a little above the surface of the ground, and of the most beautifully delicate texture.

4711. If the islands now under consideration astonish us by the singularity of some of

702

their vegetable products, the importance of others, in a commercial point of view, renders them equally interesting. A large group of them is especially termed the *Spice Islands*; a denomination which, though usually limited to part of the Malay Archipelago, may with equal justice be extended to Ceylon. Linnæus, who has drawn a beautiful, though too highly coloured, picture of the vegetation of Ceylon, while comparing it with that of northern Europe, says of it, — "A delicious climate has afforded plants of such rarity and value to this island, that scarcely any other soil can vie with it in the abundance of its aromatic productions. While Pine forests occupy our cold and sterile regions, in Ceylon Cinnamon trees constitute whole groves; in such plenty, indeed, that the inhabitants are accustomed to employ the wood for household furniture, for fuel, and for cooking. Our gardens are planted with apples, pears, plums, cherries, and other similar trees; but in Ceylon, nothing save the lofty Palms are esteemed, among which the Cocoa nuts chiefly afford the needful food, utensils, and every thing necessary to mankind. The *Caryota* there yields a wine, called *sury*. The *Coryphæ* (fig. 702.) extend their broad, smooth, and plaited fronds, which serve for shade and shelter, here most requisite for

protection from the sun's rays, as well as from sudden showers, to the natives, whose only garment is a small piece of linen. Date Palms, and the superb Bananas, decorated with wide-spreading and glossy foliage, yield, in great profusion, racemes of the most delicious fruit; to say nothing of the more valuable productions with which the soil every where abounds, such as Mangoes, the Jack, Malay Apples, Psidia, Oranges and Citrons, Cashew nuts, Averrhoas, &c. Our fields are sown with common Barley and Rye; but those of the Cingalese receive nothing but Rice, which affords them flour and bread. Our marshes are covered with Callæ; theirs with the pungent Amoma. Persicarias occupy our waste places; but with them grow different species of Pepper. In our meadows spring the Ranunculus, Plantain, Convallariæ, and many other neglected plants; in theirs, numerous kinds of Hedysarum, Galega, Hibiscus, Justicia, Cleome, Impatiens, Amomum, Myrtle, and Ricinus; besides numerous climbers, as Ipomœa, Dioscorea, Basella, Aristolochia, Ophio-glossum, Phaseolus, Momordica, Bryonia, Vine, Cissus, Pothos, Loranthus, and Acrostichum. In the room of the Meadowsweet and Mints, the meadows in Ceylon are covered with Basil, and the woods with Cinnamon. Every where occur the most precious aromatics. Ginger, Cardamom, Galanga, Costus, Acorus, Schœnanthus, Calamus aromaticus, and flowers of the most exquisite structure and colour and fragrance, such as Crinum, Pancra-tium, Poinciana, Gloriosa, as well as those plants which saturate the night air with their delicious odour, such as Polyanthes and Nyctanthes." Most of these are equally natives of the islands of the Archipelago.

4712. *The Cinnamon*, for which Ceylon is so famous, is the bark of a species of Laurel (*Laurus Cinnamomum*) (fig. 703.), remarkable, with some other species possessing similar

properties, for its coriaceous leaf, marked with three strong nerves. It was originally found wild, only, and there in very small quantities, at the south-west-ern district of the island; but when the Dutch first obtained a settlement in Ceylon, they found so many inconve-niences to arise from this limited supply, that they began to cultivate the cinna-mon in four or five very large gardens, under the auspices of the enterprising Governor Falck. The extent of these plantations may be inferred from the fact, that the quantity of spice annually ob-tained from them exceeded 400,000 lbs.,

and that from 25,000 to 26,000 persons were employed in the cinnamon department.

4713. *The rigour* with which the Dutch enforced the regulations by which they kept the monopoly of cinnamon to themselves is truly revolting, and forms a blot on their national character. Death was the punishment awarded, and mercilessly inflicted, on any person who should wilfully injure a cinnamon plant, or even sell or give away a single stick of it, or extract the oil from the foliage, or peel off any of the bark. In order to keep up the high price of the spices, the Dutch government used to have them destroyed, when the stock had accumulated, sometimes by throwing them into the sea, and sometimes by burning them. On one occasion, in the year 1760, a pile of these aromatics was consumed near the stadthouse, at Amsterdam, of which the price was estimated at 8,000,000 livres, and a similar wanton destruction took place on the following day. The air was perfumed with this incense, and the essential oils were distilled, and flowed in a spicy stream down the street, to the regret of the spectators, who were not permitted to appropriate the smallest portion of the valuable substance.

4714. *The cinnamon tree* grows, in a natural state, to twenty or thirty feet high, and sends out large spreading branches, clothed with thick foliage. The leaves are first quite pendent, of a delicate rose colour, and most tender texture: they soon, however, turn yellow, and then green. The flowers are borne in panicles, and are small and white; partaking, as well as the foliage, of the peculiar fragrance of the tree. The fruit yields an oil, which becomes waxy and solid, and of which a kind of candles is made, whose agreeable odour caused them to be appropriated, in the kingdom of Candy, to the use of the court.

4715. *When the cinnamon tree* is three years old, it affords one shoot fit to yield bark: but eight years of growth are needful before it can be freely cut. At ten or twelve years old, the tree is strongest, and those plants which grow in dry and rocky spots produce the most pungent and aromatic bark. The shoots are cut when nearly an inch thick, and two or three feet long; they are immediately barked, and the epidermis scraped off, during which process a delightful fragrance is diffused around. The bark is dried in the sun, when it curls up, and acquires a darker tint, and, the smaller portions being rolled within the larger ones, the whole is packed, and considered fit for exportation. Two harvests are

sometimes obtained annually from the same trees. Cassia, or *Laurus Cassia*, is in its botanical characters scarcely different from the true cinnamon. In quality it is much inferior, though often surreptitiously sold for it. It is commonly known under the name of Bastard Cinnamon.

4716. *Camphor* is equally the produce of a species of Laurel (*Laurus Camphora*) (fig. 704.); but its leaves do not exhibit the three strong parallel nerves of the *L. Cinnamomum* and *L. Cassia*. The whole tree has a strong odour of camphor, and this substance is obtained by the distillation of the roots and smaller branches. They are cut into chips, and distilled within an iron pot, in which they are suspended above boiling water; the steam of which, penetrating the twigs, causes the camphor to fly off, and it becomes concreted on straws which are placed in the head of the still. Camphor is much employed in medicine as a stimulant and cordial.

4717. *The Sumatran Camphor* is found concreted in the clefts of the bark of *Dryobalanops Camphora*. This is said to be more expensive and fragrant than the Japanese kind, and does not so soon evaporate on exposure to the air. It is sent, therefore, to China and Japan, where it is more highly valued than the native produce of these countries: this last, however, and not the Sumatran, is the camphor usually imported into this country.

4718. *The Clove* (*Caryophyllus aromaticus*) (fig. 705.) is one of the most precious commodities of the East, and one of the most valuable in commerce. Almost every part of the plant is covered with minute dots or glands, which contain the essential oil that gives the aromatic odour to it. These abound, particularly, in the substance of the germen, near the epidermis. The Clove was introduced to the Kew Gardens, in 1797, by Sir Joseph Banks. Its native country is the Moluccas; but, from its value as a spice, its culture has extended to the East and West Indies; and we must endeavour to lay before our readers some details respecting a plant of such importance, that it was once the staple commodity of some of the East India Islands, particularly Amboyna.

4719. *The clove of merchandise is the unexpanded flower*; the corolla forming a ball or sphere on the top, between the teeth of the calyx: thus, with the narrow base or germen tapering downwards, giving the appearance of a nail; a similarity, indeed, much more striking in the dry than in the fresh state of the bud. Hence the Dutch call it *naghel*; the Spaniards, *clavo*; the Italians, *chiodo*; and the French, *clou*; from which the English *clove* is evidently derived. The uses of cloves are well known, as giving flavour to dishes and wines; and as stimulant, tonic, and exhilarating in medicine. These properties, with the acrid and burning taste, depend on the essential oil, which is obtained from them by distillation.

4720. *The cloves are gathered by the hand*, or beaten with reeds, so as to fall upon cloths placed under the tree, and dried by fire; or, what is better, in the sun. The fully formed berries, which are about an inch long, pear-shaped, and of a beautiful violet colour, are preserved in sugar, and eaten after dinner, to promote digestion.

4721. *The true Nutmeg tree* (*Myristica officinalis*) (fig. 706.) is, as well as the Clove, a native of the Molucca or Spice Islands, and principally confined to that group called the Islands of Banda, where it bears both blossom and fruit at all seasons of the year. In their native country, the trees are almost always loaded with blossoms and fruit. The gathering of the latter takes place at three periods of the year: in July and August, when the nuts are most abundant; but the Mace is thinner than on the smaller fruits, which are gathered during November, the second time of collecting: the third harvest takes place in March, or early in April, when both the Nutmegs and Mace are in greatest perfection, their

CAMPHOR

CLOVE.

NUTMEG.

number not being so great, and the season being dry. The outer pulpy coat is removed, and afterwards the mace, which, when fresh, is of a beautiful crimson colour, and covers the whole nut. The nuts are then placed over a slow fire, when the dark shell which, immediately beneath the mace, coats the seed, becomes brittle; and the seeds, or nutmegs of commerce, drop out: these are then soaked in sea water, and impregnated with lime, a process which answers the double purpose of securing the fruit from the attacks of insects, and of destroying the vegetating property. It, further, prevents the volatilisation of the aroma. The Mace is simply dried in the sun, and then sprinkled with salt water, after which it is fit for exportation. The uses both of nutmegs and mace are well known, whether in a medicinal or economical point of view. The whole fruit, preserved in sugar, is brought to table with the dessert, but not till after the acrid principle has been, in a great measure, removed, by repeated washings. An essential oil is obtained from both these spices, by distillation, and a less volatile one, by expression.

4722. *Pepper*, the seeds of *Piper nigrum* (*fig. 707.*), is another spice, which is extensively cultivated in the islands in question, as well as on the coast of Malabar, and forms an important article of trade. It was known to the Greeks in the time of Theophrastus and Dioscorides, who, as well as the Romans, distinguished between the white and black pepper. And whilst the use of Betel Pepper, to which we shall next allude, is confined almost wholly to the Eastern nations, the common pepper is an article of general use throughout the civilised world. Still, it is in Asia, where the stomach is weakened by excessive perspirations, produced by the heat of the climate, by a humid atmosphere, and a too general addiction to vegetable diet, that it is employed as a powerful stimulant. Thus, in a medical point of view, it has been found to act as an excellent tonic, calculated to create appetite and promote digestion.

The Pepper plant, or Pepper vine, as it is commonly called, is a weak climber, which attaches itself by small fibres to other bodies, or to the ground, like ivy; it bears large heart-shaped, veiny leaves, and long slender catkins of flowers, succeeded by the berries, which we term peppercorns. These, when covered with their natural husk or coat, constitute black pepper. White pepper is the same fruit, deprived of its outer covering, which is accomplished by soaking the grains in water, when the coat swells and bursts. It is afterwards dried in the sun, and, by friction and winnowing, cleared of the husk. It is then of a paler colour; but, as the shell or bark contains a powerful principle, it is evident that white pepper loses much of its stimulating property, and is inferior to the black. Mr. Marsden informs us, that as soon as any of the corns on a bunch change from green to red, it is considered fit for gathering; for, if pulled ripe, many of the seeds would drop off. It is collected and spread to dry in the sun; nor are the vicissitudes of weather that may occur during its exposure thought to injure it. In this situation it becomes black and shrivelled, as we see it in Europe, and is hand-rubbed, to separate the grains from the stalk. That which is pulled at the most proper stage of maturity will shrivel least; if plucked too soon, it falls into dust. Thus, weight is the great test of goodness in pepper, and machines are constructed for the purpose of separating the light kind from the sound. Two crops are generally produced in one year; the culture is attended with some trouble, as it is necessary to keep the pepper gardens scrupulously free from weeds, and to give them sufficient irrigation. In the small island of Penang, the crop of pepper, in 1802, was estimated at about 216,000 dollars. Sumatra also yields this spice; but the quantity is inconsiderable when compared with the produce of the coast of Malabar, whence no less than ten full

cargoes, amounting to 8,000,000 or 9,000,000 lbs., might be annually exported. But half this quantity is carried over the mountains to the coast of Coromandel, to the north, to the Deccan, and farther on, to different parts of Hindostan. This pepper is esteemed the best in all Asia, and is most sought after by foreign nations.

4723. *Another kind of pepper* in general cultivation and repute throughout India, is the *Piper Betle*, or Betel pepper (*fig. 708.*). Its use may be traced to a very remote date; for, in an ancient Sanscrit inscription on stone, published in the *Asiatic Researches*, this plant is reckoned among the greatest blessings of the country; "in its towns are numerous groves

PEPPER

BETEL PEPPER.

of mangou, plantations of luxuriant betel, and fields of rice; channels of water, and wells; opulent men and beautiful women; temples of gods and of the saints; and men blessed with vigour of body and every virtue."

4724. *The habit of this plant* resembles black or common pepper; but the leaves and catkins are much larger, the former of an oblong shape, and more oblique, and the corns or seeds infinitely bigger. In the East Indies, and especially the Malay islands, the inhabitants have, almost from time immemorial, considered the Betel Pepper as a necessary of life; and this, not by itself, but with the use of lime and the Areca nut, together constituting a masticatory, employed by both sexes, and at all ages. Various travellers relate particulars of the use of this plant; but we shall confine ourselves to those of Marsden, in his *History of Sumatra*; the custom of chewing the Betel-leaf being, perhaps, more prevalent among the Malays than any other nation. "Whether," he says, "to blunt the edge of painful reflection, or owing to an aversion our natures have to total inaction, most nations have been addicted to the practice of enjoying, by mastication or otherwise, the flavour of substances possessing an inebriating quality. The South Americans chew the Cocoa and Mambeco, and the Eastern people, the Betel and Areca; or, as they are called in the Malay language, the Sirih and Pinang. This custom is universal among the Sumatrans, who carry the ingredients constantly about them, and serve them to their guests on all occasions; the prince in a gold stand, and the poor man in a brass box or mat bag. The betel-stands of the better ranks of people are usually of silver, embossed with rude figures. The Sultan of Moco-moco was presented with one by the East India Company with their arms on it; and he possesses another, besides, of gold filigree. The form of the stand is the frustum of an hexagonal pyramid reversed, about six or eight inches in diameter. It contains many smaller vessels, fitted to the angles, for holding the nut, leaf, and chunam, which latter is quicklime made from calcined shells; with places for the instruments employed in cutting the first, and spatulas for spreading the last. When the first salutation is over, which consists in bending the head, and the inferior's putting his joined hands between those of the superior, and then lifting them to his forehead, the betel is presented as a token of politeness, and an act of hospitality. To omit it on the one hand, or to reject it on the other, would be an affront; as it would be likewise, in a man of subordinate rank, to address a great man, without the precaution of chewing it before he spoke. All the preparation consists in spreading on the Sirih, or Piper Betle leaf, a small quantity of the chunam, and folding it up with a slice of the Pinang nut. From the mastication of these proceeds a juice which tinges the saliva of a bright red, and which the leaf and nut, without the chunam, will not yield. This hue, being communicated to the mouth and lips, is esteemed ornamental; and an agreeable flavour is imparted to the breath. The juice is usually (after the first fermentation produced by the lime), though not always, swallowed by the chewers of betel. We might reasonably suppose that its active qualities would injure the coats of the stomach: but experience seems to disprove such a consequence. It is common to see the teeth of elderly persons stand loose in the gums, which is probably the effect of this custom; but I do not think it affects the soundness of the teeth themselves. Children begin to chew betel very young, and yet their teeth are always beautifully white, till pains are taken to injure them, by filing and staining them black. To persons who are not habituated to the composition, it causes a strong giddiness, astringes and excoriates the mouth and fauces, and deadens for a time the faculty of taste. During the Pausa, or fast of Ramadan, the Mahometans among them abstain from the use of betel whilst the sun continues above the horizon; but, excepting at this season, it is the constant luxury of both sexes from an early period of childhood: till, becoming toothless, they are reduced to the extremity of having the ingredients previously reduced to a paste for them, that without further effort the betel may dissolve in the mouth. Mixed with the betel, and generally in the chunam, the Sumatrans have a practice of conveying philtres, or love-charms. How far they prove effectual I cannot take upon me to say; but I suppose they are of the nature of our stimulating medicines. The custom of administering poison in this manner is not followed in later times; but that the idea is not so far eradicated as entirely to prevent suspicion, appears from this circumstance; that the guest, though taking a leaf from the betel-service of his entertainer, not unfrequently applies to it his own chunam, and never omits to pass the former between his thumb and fore-finger, in order to wipe off any extraneous matter. This distrustful procedure is so common as not to give offence."

4725. *Among those plants* which are natives of the islands of the Indian seas are several belonging to an extensive natural family which has been ably and splendidly illustrated by the lamented historian of Leo X.; we mean the Scitamineous plants: and so peculiarly do they inhabit the countries just mentioned, that these are denominated by M. Schouw, *par excellence*, "the region of Scitamineæ." Among them are reckoned some species of Canna or Indian Shot, of Arrowroot (*Maranta*), of Phrynium, Hedychium, Roscoeia, Alpinia, Ginger, Costus, Kæmpferia or Galangale, Amomum, Turmeric (*Curcuma*), Globba, Mantisia, &c.

4726. *True Ginger* is afforded by the roots of *Zinziber officinale*; a plant so easy

of cultivation in tropical countries, that imported into the New World it is extensively grown in the West Indies, and on the continent of South America. Edwards, in his *History of the West Indies*, assures us that, as early as 1547, its culture was so diffused in New Spain, that 22,053 cwt. were thence exported to Europe in one year.

KÆMPFERIA GALANGA.

4727. *Kaempferia Galanga* (fig. 709.), the officinal Galangale, and *K. angustifolia* are both employed as medicinal plants, and are stomachic and cephalic.

4728. *Curcuma Zerumbet* or *Zedoary* is likewise a celebrated Indian plant belonging to this family.

4729. *Rice* (*Oryza sativa*), though cultivated in all warm climates throughout the world, is considered of Asiatic origin, and is nowhere more extensively raised or more valued, than throughout the islands of the East Indies.

4730. Among the numerous fruits of these islands, we shall only now mention the Guava (fig. 710.) (*Psidium pyriferum*), the Mango (*Mangifera indica*) (fig. 711.), the

GUAVA.

MANGO.

Mangoostan (*Garcinia Mangostana*) (fig. 712.), the Durion (*Durio Zibethinus*) (fig. 713.), and the Malay Apple (*Eugenia malaccensis*), which, highly as they are prized in their native

MANGOOSTAN.

DURION.

country, the utmost skill of British Horticulture has never been able to bring to any thing like perfection in the stoves of our island, where indeed it is exceedingly difficult to cultivate many of them at all.

SUBSECT. 3. Zoology.

4731. *The Zoology of the Indian Archipelago* is so remarkable for the variety, splendour, and singularity of its forms, that it is difficult to say in which department it is most interesting. Flourishing beneath a tropical sun, and nourished by marine vapours in a soil naturally humid, vegetation here attains a luxuriance inconceivably magnificent. Animal life equally partakes in this exuberance, and exhibits, under every form, the most singular shapes, and the most brilliant combinations of colours. It is in these distant and little known islands that the great satyr-like Apes dwell in the solitude and the security of their native forests; while the surpassing beauty of the Birds of Paradise, and the numerous variety of superb-coloured Lories, are among the most striking features in their ornithology. As most of the large islands possess many animals hitherto undiscovered in others, we shall notice them under distinct heads.

4732. **JAVA.** *The Zoology of Java* derives peculiar interest from having been investigated by two of our most eminent naturalists, the late Sir Stamford Raffles, and Dr. Horsfield. Under the liberal auspices of the East India Company, the researches of the latter have been given to the public. We are thus enabled to put aside the vague and erroneous accounts of travellers, on which, unfortunately, we are too often obliged to depend; and can confidently enumerate the chief peculiarities in the zoology of Java, one of the most important islands in India.

4733. *The great number of native quadrupeds* belonging to this island will become apparent from the following list:—

<i>Semnopithecus maurus.</i> Negro Monkey.	<i>Putorius nudipes.</i> Java Polecat.	<i>Sciurus bicolor.</i> Two-coloured Squirrel.
<i>Nycticebus javanicus.</i> Javanese Lemur.	<i>Mephitis meliceps.</i> Telegon Polecat.	<i>Sciurus bilineatus.</i> Two-rayed Squirrel.
<i>Megaderma trifolium.</i> Three-leaved Bat.	<i>Viverra Rasse.</i> Rasse Civet.	<i>Sciurus nigrovittatus.</i> Black-banded-Squirrel.
<i>Ronolophus,</i> six species.	<i>Genetta indica.</i> Indian Genett.	<i>Sciurus Finlaysonii.</i> Finlayson Squirrel.
<i>Nycterus javanica.</i> Javanese Bat.	<i>Mangusta javanicus.</i> Javanese Ichneumon.	<i>Pteromys genibarbis.</i> Bearded Flying Squirrel.
<i>Vespertilio,</i> five species.	<i>Prionodon gracilis.</i> Slender Gennet.	<i>Pteromys nitidus.</i> Bright Flying Squirrel.
<i>Nyctinomus delatus.</i> Delated Bat.	<i>Felis javanensis.</i> Javanese Cat.	<i>Pteromys sagitta.</i> Barbed Flying Squirrel.
<i>Nyctinomus tenuis.</i> Slender Bat.	<i>Felis undata.</i> Waved Cat.	<i>Pteromys lepidus.</i> Long-tailed Squirrel.
<i>Cheiromeles torquatus.</i> Collared Bat.	<i>Felis Diardi.</i> Diard's Cat.	<i>Lepus nigricollis.</i> Mausel Hare.
<i>Pteropus edulis.</i> Eatable Bat.	<i>Phalangista rufa.</i> Red Phalanger.	<i>Moschus javanicus.</i> Javanese Musk.
<i>Pteropus minimus.</i> Little Bat.	<i>Mus javanus.</i> Javanese Rat.	<i>Moschus napu.</i> Raffles's Musk.
<i>Tupaia javanica.</i> Javanese Tupaia.	<i>Mus setifer.</i> Bristle-bearing Rat.	<i>Moschus Pelandoc.</i> Pelandoc Musk.
<i>Tupaia ferruginea.</i> Ferruginous Tupaia.	<i>Sciurus Leschenaulti.</i> Jeralang Squirrel.	
<i>Gulo orientalis.</i> Oriental Glutton.		

4734. *The following quadrupeds*, from their rarity or singularity, deserve a more detailed notice. The Javanese and ferruginous Tupaia; the Wild Cat of Java, the Long-armed Ape, and the Genett or Coffee Rat. The Two-coloured Squirrel (*fig. 714.*) is a peculiar

species confined to this island, where it lives only in the deepest forests: the colour above is brown, but the fur on the under parts is of a golden yellow: it is a great favourite with the natives, who keep it in confinement.

TWO-COLOURED SQUIRREL.

clothed at the base with a soft down; that on the under parts being remarkably delicate and silky: the colour above is brown, variegated with grey, having a regular narrow streak extending from the neck, over the shoulder: the lower parts are dirty white. This appears to be a rare, or at least a very local animal; as Dr. Horsfield met with only two individuals in the extensive and almost inaccessible forests of Blambangan. (*Zool. Res.*, No. 3.)

4735. *The Javanese Tupay* (*Tupaia javanica*), one of the many interesting discoveries of Dr. Horsfield, is an animal peculiar to this island, and constitutes a distinct species from either of those two found in the other Indian islands. It is a small animal, somewhat resembling a squirrel in the gracefulness and agility of its form, no less than in carrying its broad tail, like a plume, on the back. The fur is thick-set, close, and

CHESTNUT TUPAY.

4736. *The chestnut or ferruginous Tupay* (*Tupai Press* of the Malays) (*fig. 715.*), is a singular little animal, possessing all the tameness and sprightliness of the squirrel. The length of the body is about six or eight inches; the tail, which is not quite so long, is like that of a squirrel, except in being rounder. The back and sides are rusty brown, the belly whitish. This is the only species of Tupaia of whose habits and manners we possess any positive information. Sir S. Raffles remarks (*Lin. Trans.*, vol. xiii. p. 257.):—"This lively playful animal I first observed tame in a gentleman's house at Penang, and afterwards found wild at Singapore, and in the woods of Bencoolen: it was suffered to go about at perfect liberty, ranged in freedom over the whole house, and never failed to present himself at the breakfast and dinner table, where he partook of fruit and milk."

4737. *The Javanese Wild Cat* (*Felis javanensis* C.) is considerably larger than the Bengal Cat, measuring above two feet seven inches, of which eight inches and a half are occupied by the tail. In its shape it exhibits that elevation of the legs, comparative shortness of the tail, and number of grinders (which are only three), which separate these smaller beasts of prey from the more powerful of their congeners; while its small ears, placed much more distant from the eyes, give it an appearance very dissimilar to the domestic cat. The general colour is light greyish brown, nearly white beneath; on the back are four

dark brownish stripes, which, although broken, are continued the whole length of the animal; while the oblong spots on the sides are in like manner disposed, with some regularity, in four series: the limbs and tail are similarly marked. The *Felis javanensis* is met with in all the large forests of Java, concealing itself during the day in hollow trees, but roving about at night, committing depredations on the poultry yards. Dr. Horsfield tells us, that the natives ascribe to it an uncommon sagacity; asserting that, in order to approach the fowls unsuspected, and to surprise them, it imitates their voice. Its natural fierceness is such as to render it perfectly untameable. Like the wild cat of Europe, it feeds chiefly on small birds and quadrupeds; but when pressed by hunger, it is said to devour even carrion. (Horsf.)

4738. *The Long-armed Black Ape* (*Simia syndactyla* Horsf.) is upwards of three feet high, of a strong muscular form, and throughout of a jet black colour: it has no tail, but its long arms touch its feet: its peculiar character lies in the fingers being joined together at their base (fig. 716.). These apes abound in the forests of Bencoolen, living in large companies, and making the woods echo with their loud and peculiar cry. In captivity they are remarkably tractable.

HAND OF THE SIMIA SYNDACTYLA.

This animal, in size and colour, so nearly resembles the Genett, that it was long considered to be the same species. It is abundant near the villages adjoining the large forests; rambling, during the night, in the gardens and plantations in search of fruits of every description, preferring the more delicate and pulpy kinds, and causing much devastation among the pine apples. Its fondness for coffee is so great, that it is called by many the Coffee Rat. In this repast it likewise shows a very delicate taste; for the little pilferer selects only the ripest and most perfect fruit, the seeds of which, as Dr. H. relates, being discharged unchanged, are eagerly collected by the natives, as the coffee is thus obtained without the tedious process of shelling! Its nest is constructed, like that of the squirrel, in hollow trees. If taken young, it soon becomes gentle and docile, and readily subsists on either animal or vegetable food; the latter is indeed its natural subsistence; but if pressed by hunger it is known to attack fowls and small birds. "The injurious effects," observes Dr. H., "occasioned by the ravages of the Luwak in the coffee plantations, are, however, fully counterbalanced by its propagating the plant in various parts of the forests, and particularly on the declivities of the fertile hills. These spontaneous groves of a valuable fruit, in various parts of the western districts of Java, afford to the natives no inconsiderable harvest, while their accidental discovery surprises and delights the traveller, in the most sequestered parts of the island." (Horsf. Res., No. 1.)

4740. *The appearance of the Bats is striking*, both from their size, and their strange conformation. The *Cheiromeles torquatus*, or Tippet Bat (fig. 717.), measures, in extent of wing, two feet, having a head not much unlike that of a dog, with a tuft of hair on its toe nails. The head of another species, the *Pteropus rostratus*, or Long-snouted Bat (fig. 718), resembles that of a greyhound. The animal itself lives in large societies, and feeds entirely upon fruits; hence causing the greatest damage to plantations.

TIPPET BAT.

LONG-SNOUTED BAT.

4741. *The Ornithology* appears more interesting than beautiful, as comparatively few species of Parrots or other richly coloured birds of India are contained in the descriptive catalogue of Dr. Horsfield: little is known of their natural economy, and technical descriptions of colours will not interest the general reader. A glance at some of the most remarkable will, therefore, be sufficient. Near the mountain streams of the interior is seen the rare and delicate *Enicurus speciosus*, or Crested Wagtail (fig. 719.), running on the

CRESTED WAGTAIL.

ground, like the European Wagtail. The deep forests are the favourite resort of two peculiar species of Wild Cock (*Gallus Bankiva* and *javanicus*), and likewise afford a beautiful Peacock, unknown to other parts of India. Dr. Horsfield enumerates ten distinct Pigeons, and eight Woodpeckers, different from those of the continent. The colours of the rare *Calypomina viridis*, or the Green Fruit-eater (fig. 721.), so exactly harmonise with those of the trees which it frequents, as to render the bird undistinguishable by a near bystander. The Flycatchers are not numerous; and the Great-

billed Tody (*Eurylamus Horsfieldi*)

720

GREEN FRUIT-EATER.

(fig. 721.) is a rare inhabitant. The Javanese Crested Swallow (*Macropteryx longipennis*) is one of the most elegant of its tribe, and the *Pogardus javanensis*, or Great Javanese Goatsucker, is particularly rare, even in its native island.

721

GREAT-BILLED TODY.

4742. Upon the whole, the ornithology of Java may be considered as very rich, since Dr. Horsfield, as the result of his individual researches, furnishes us with a list of 208

native species, and many others have been since discovered by the French naturalists.

4743. The *Insects* are numerous and splendid, but a long list of names may be dispensed with. Little attention has yet been paid to the marine productions, so that a vast and interesting field for discovery still lies open to the Oriental naturalist.

4744. SUMATRA. — The *Zoology* of this luxuriant island has been partially but ably illustrated by the late Sir Stamford Raffles, who to the wisdom of a statesman united the learning of science, and a thirst for knowledge rarely equalled. The government of India might well be proud of such a man, whose high attainments shone forth in every thing he planned or executed.

4745. The *quadrupeds* yet discovered are among the most singular of those found in the Indian Archipelago; while the vast unexplored forests of the interior appear to contain others of imposing size, as yet but imperfectly known from the general accounts of the natives. Some idea may be formed of the zoological riches of Sumatra, by the following list of such quadrupeds as are ascertained natives:—

Hylobates syndactyla. Siamang Gibbon.
Hylobates agilis. Active Gibbon.
Presbytis mitrula. Capped Monkey.
Semnopithecus maurus. Negro Monkey.
Semnopithecus melatophus. Simpai Monkey.
Semnopithecus pruinosis. Villose Monkey.
Semnopithecus comatus. Tufted Monkey.
Semnopithecus entellus. Black-handed Monkey.
Ceropithecus albocinereus. Grey Monkey.

Tupaia tana. Sumatran Tupaia.
Lutra leptonyx. Javanese Otter.
Canis sumatrensis. Sumatran Dog.
Felis nebulosa. Clouded Tiger.
Felis sumatrana. Sumatran Cat.
Sciurus affinis. Allied Squirrel.
Sciurus tenuis. Slender Squirrel.
Sciurus insignis. Bokall Squirrel.
Sciurus bivittatus. Two-banded Squirrel.
Hystrix longicauda. Long-tailed Porcupine.

Hystrix fasciculata. Fascicled Porcupine.
Rhinoceros bicornis var. Sumatran Rhinoceros.
Rhinoceros sumatranus. Raffles's Rhinoceros.
Tapirus malayanus. Malay Tapir.
Cervus rafflesii Sw. Malay Stag.
Cervus muntjak. Muntjak Doe.
Nemorhedus sumatrensis (Smith). Cambeng Antelope.

4746. To these must be added several others, mentioned by the natives, but still unknown to Europeans. "Native information," observes Sir S. Raffles, "gives reason to believe that the Orang Utan exists in the interior of Sumatra. It is frequently confounded with the Orang Kubu and Orang Gubu of Marsden, which, though often the subject of fable and exaggeration, appear to exist on the island as a distinct race of men, almost as hairy and wild as the real Orang Utan." The natives seem acquainted with several sorts of Tigers, equal in size, but different in colours and habits, from that of the Continent, as the Rimau kumbang, or Black Tiger; the Rimau samplat, and others. They further describe another ferocious animal, apparently a kind of Lion. Their Rimau Dahan is said to be the size of a leopard, but darker and less regularly spotted. The king of Acheen assured Sir Stamford, that an animal called Jumbing was found in the eastern parts of his dominions, nearly the size and make of a horse, but having two unequal horns. These notices, from their very imperfection, are calculated to excite the curiosity and stimulate the enquiries of future travellers; at the same time they convey to the general reader some idea of the formidable and imposing animals which still remain hid from science in the primeval forests of India.

4747. A curious little animal, the *Tupaia tana* (the Sumatran name, adopted by Sir Stamford Raffles)

722

TUPAIA TANA.

(fig. 722.), is nearly seventeen inches long. In form it bears some resemblance to the squirrel, but the snout is narrowed, and proportionably lengthened, like that of a shrew-mouse. The fur is soft and delicate, of a dark-brown or blackish colour above, and reddish beneath; the back of the head is marked by a narrow transverse band of black, which forms an obscure crest. The great elongation of the snout places this species as the type of this highly singular genus. The natives affirm it is always found on or near the ground, but its scarcity prevented this account from being verified.

4748. Two distinct species of *Rhinoceros* inhabit the interior. One of these, the *R. sumatranus* Raff. has two horns. The other is well known to the natives, but never yet seen by Europeans; they call it Tennu, and describe it as having but one horn, and being marked with a narrow whitish belt encircling the body.

4749. The Malay Tapir (fig. 723.), although a quadruped of nearly the first magnitude, is a recent dis-

covery of the late Major Farquhar. It is nearly equal in size to the buffalo; and is particularly distinguished by its colour, the fore and hind parts being glossy black, while the body has a broad and well-defined belt of white, extending circularly round it, resembling a piece of white linen thrown upon the animal. Its disposition is so mild and gentle, that it will become as tame and familiar as a dog.

MALAY TAPIR.

This breed is quite distinct from the *Banting* of Java and the more eastern islands. Reddish white Buffaloes are common at Bencoolen.

4752. *The Dog of Sumatra* is wild and untameable; numerous packs inhabit the interior forests, where they hunt in unison. The tail is brushed, like that of a fox; the ears short and erect, and the whole conformation resembles that of the Dingo, or Australian dog.

4753. *Even the Cats* partake of the peculiar interest attached to Sumatran zoology. There is one breed having a knobbed or twisted tail, and another with no tail at all!

4754. *On the Birds*, our limits compel us to be concise. Vultures are rare on the west coast, but are occasionally seen on the Malay peninsula. Parrots, as in Java, are less numerous than in the more eastern islands, particularly the Moluccas: but six distinct kinds

YELLOW-BILLED CUCKOO.

of Hornbill are mentioned by Sir Stamford. Among the Cuckoos is that called the Yellow-billed (*C. xanthorhynchos*) (fig. 724.); the throat and upper plumage is of a rich glossy violet, the body being white, with black lines.
